'Meantime, the steamer had put up her helm, and was steaming away towards the land. Then, to my horror, the lifeboat hauled aft her sheets and went after her. It was a cruel sight; and as she receded from my view, my heart sank within me with gloomiest foreboding. I went back into the fore-castle and sat down and buried my face in my hands. That was the bitterest moment I had ever passed, for I felt that our situation was now almost hopeless. I was sitting thus, almost in a state of stupor, when a great wave lifted the ship high in the air; and a second afterwards, she came down with a shock so tremendous that she literally broke her back. We all rushed out, staring about us in stupefied horror.

'Get out the boats!' roared the captain. I believe he was half bewildered, or he would never have thought of launching a boat in such a sea. The men too were beside themselves with terror. It seemed as if they were only now for the first time conscious of the desperate perils that surrounded us. I was quite sure that no boat could live in the tremendous waves that were raging around us; but still it seemed our last chance, and like the rest, I made a frantic rush for the boats. The lashings were cast off, and two boats were lowered; but scarcely had they touched the water, when they were dashed to pieces against the ship's side.

'Meantime, the captain's gig had been got into the water; she was a small boat, and would not

have held anything like half of us. Two hands were put into her, to bale her out. Suddenly, a gigantic sea struck the ship on her quarter; the boat's painter—a new rope thick and strong—snapped off like a pipe-stem; the boat was capsized, and the two poor fellows in her were pitched into the water. They were good swimmers, and for a minute or two they struck out for the ship. Another sea swept round the quarter and drove them back towards the boat, and they disappeared from our view. I thought it was all up with them; but the next minute I saw them struggle up on the boat's bottom. I watched them for some time, as they drifted away and then disappeared. Not a word was spoken. We all stood aghast, dumfounded—our last chance was gone.

'The scene as night came on was terrible indeed. The spectacle of the raging sea was truly terrific; every wave that dashed over the ship shook the masts till they trembled again. The mainmast rocked to and fro in a way that showed whatever might be the fate of the other masts, that at least was doomed. The raging of the gale was awful, and that and the cold struck terror into our hearts.

'After the destruction of the boats, I took shelter in the fore-castle. I was regularly cowed, for the prospect before us was truly appalling. The ship was settling down fast, and every sea now swept right over us, and we saw that very soon there would be nothing left but for us to take to the rigging. I don't mean to say that I thought at this time that there was any chance of my life being saved; but a fancy prompted me to have a good shirt or two to my back; so I put on two new shirts and all my shore-going togs, and one or two others followed my example.

'Just before eight o'clock, a tremendous sea swept the decks fore and aft, and burst right into the fore-castle. We all rushed out, and began to swarm up the rigging. The captain called out to us to come aft, as the foremast was of iron, and if it went by the board, it would sink. But we did not pay any attention to him; that last sea had given us a scare; and so on we went, the pilot, myself, and eight others; and we all managed to get safely into the fore-top.

'In the shelter of the fore-castle, it had been piercing cold; but when we got aloft, it was almost freezing. That cutting, biting north-east wind penetrated to our very marrow; and by the time I got into the top, my hands were so numbed that I could scarcely feel, so that I had some difficulty in lashing myself to the mast. There we sat, ten poor helpless creatures, almost in a state of stupor; but though we were half-frozen, there was none of us so paralysed but that we could fully realise the horrors that surrounded us. The remainder of the crew, together with Captain Fraser, Mr Lloyd the mate, Mr Fraser the second-mate, who was the captain's brother, and a fine young fellow whose name I do not remember—in all, seventeen in number, took to the mizen-mast; and we could see them lashing themselves in the rigging. The moon had only just entered her first quarter, and even if the sky had been clear, she would not have given us much light. But the night, though fine, was cloudy, and it was only now and then that she peeped out from between the clouds, and cast a sickly gleam upon the troubled sea.

The sight of the raging water beneath us was appalling, but the sounds which met the ear were if anything more so. The wind howled and shrieked, the torn canvas flapped and thundered, the sea roared, and the loose ropes coiled and thrashed the air like whip-lashes.

'When the moon shone out, there was just light enough to show the three gaunt masts sticking up out of the water. Every sea that swept over us made the mainmast rock and oscillate, so that every minute I expected that it would go by the board. It made me cringe again every time it lurched to leeward, because the chances were that when it did so, one of the other masts would follow it. Nobody can tell, and I can't describe what my feelings were as I sat there in the top with nothing but a few shrouds and a frail shaking mast between me and eternity. How the hours passed, I cannot tell. We all sat on, cold and utterly miserable. All that I seemed to care for was, if the end was to come, that it might come quickly. I shut my eyes and prayed; yes, I prayed, and I hope in a fitting spirit. I read once in an old book that the way to teach a man to pray was to send him to sea and let him be shipwrecked. Well, all I can say is, that if a man can't pray to God earnestly with death staring him in the face, as it did me, he is not good for much in this world, and I am sure he is ill prepared for the next. There are a lot of people who scoff at religion and care nothing about God; but let them come and look death in the face as I did, and I fancy they'll tell you rather a different story. In the dire calamity that had befallen me, there was no one I could go to but God. I committed myself entirely into the hand of Him who ruleth the winds and the waves, and asked Him if it was His good pleasure to help me; and after that, I was comforted.

'There was a lot of things I thought about that night that I had not thought about for many a long year. I had never been a really bad fellow, and perhaps had a few errors and follies to answer for as most people of my class; but up in that top there, I found the score marked against me long enough in all conscience. When things go well with us, and we think death is far off, our sins are forgotten almost as soon as they are committed; but when death is certain, or at least appears so to us, it is then that the whole black catalogue rises up before us, and each item appears distinctly before us in a few seconds.

'I had been sitting ever so long looking into myself, as it were, when I opened my eyes and looked up. I was startled by seeing a black object coming down the main-topmast stay. It came nearer and nearer, and at last I could see that it was a man coming down the stay hand over hand. When he reached us, I found it was the mate, Mr Lloyd. "What's the matter, sir?" I asked in a hoarse whisper. "Nothing, my lad, nothing; only I could not rest on the mizzen-mast. Somehow, I seemed to have a warning that it was not safe."

'I made room for him; and then we sat on a long while, silent and motionless. For a time the storm seemed in some measure to abate; but the sky to windward looked black and sullen, and the swell of the vast waves seemed to mock at our frail security. Presently, it grew as dark as pitch, and the gale came swooping down upon

us with tremendous violence. The fury of the waves, as they dashed over the ship, I cannot describe. All at once, there was a fearful crash, followed by cries and shrieks. The main and mizzen masts had both gone by the board. The scene at this juncture baffles description. Utter darkness enveloped the doomed ship, over which the sea broke in tremendous waves, the noise of which and the howling of the wind almost drowned the agonising cries of the men on the fallen mizzen-mast. A minute or two afterwards, a gleam of moonlight shone out from between two clouds, and the scene that it disclosed will ever be engraved on my memory. The mass of wreck to leeward, the struggling forms in the waves, and the frantic cries of distress, I can never forget. It was a heart-rending sight, and the whole period of my life seemed to be concentrated into that one awful moment.

'The revulsion of feeling which followed on this scene of horror, left me in a state of torpor and sluggish indifference which seemed to me to be the precursor of death. I sat for a long time staring stupidly out into vacancy, when all of a sudden, on the top of a sea I saw a light. It vanished almost as soon as I had seen it, so I waited for a second or two, and then I saw it again.

"There's a steamer out there!" I cried, pointing out into the darkness. "I can see her lights."

"Lights!" replied the mate, after he had looked out for some minutes; "I can't see any."

"There! Can't you see it now," I cried, "out on the port quarter!"

"No," replied he despondingly; "I can't see anything."

"Well," muttered a man close to me, "if it is a steamer, she can't help us till daylight; and by that time we shall be food for the fishes, or else frozen to death."

'We sat on thus through that interminable night, now and then seeing the steamer's lights. What it meant, no one knew. At last, the day dawned, and a wild scene lay around us. The sea resembled a mad chaos of water; the portions of the waves that were not white with foam, looked green and angry; and when two cross seas met, they spouted up great jets of foam as high as the cross-trees. As to the poor *Indian Chief*, you never saw a more perfect wreck; the decks were blown up by the force of the in-rushing water, and the hull almost torn to pieces, the timbers started, rent, and twisted—a skeleton of a ship, with little but her ribs left in some places.

'I gazed and gazed about, and at last I saw—Was it true, or was I dreaming? No! it was no dream, for there was a lifeboat close to us, and a steamer in the distance! I shrieked out to my mates: "A lifeboat! a lifeboat!" They all sprang to their feet, as if they had been electrified. We shouted as loud as we could, and I seized hold of a strip of canvas, and waved it wildly. We were all almost mad with excitement. It was to us like a reprieve from death. There was no mistake about this boat; she headed right straight for the ship, never deviating an inch from her course. I knew by instinct that the men that were in her meant to save us. But would she ever get safely through that dreadful sea? It was a noble, but at the same time a painful sight. The

waves were rolling along in all their fury, beating down upon the sands with tremendous force. Several times a huge wave broke right into the boat, and she disappeared from our sight; but she rose again like a duck, shook her wings, and came on again. Once a monster wave came boiling after her like an angry demon, its huge crest curling right over the coxswain's head. It took the boat's stern, and hove it up till the gunwales were almost perpendicular. I dared not breathe, for I thought she must pitch over stern first, and capsize end for end. But no; the next instant she had cleared herself, and was coming right for us.

'By this time, we had reached the deck, and were making our way bit by bit along the lee rails till we reached the quarter. The lifeboat hailed us, telling us to make a line fast to a buoy and cast it out. We threw the buoy as far as we could; and after much trouble, it was picked up, and got on board the lifeboat, and so a line of communication was made. But it was a work of difficulty to get the lifeboat alongside; and when she did, she was tossing and plunging about in a way that made it difficult for us to get into her. Slowly, however, one by one, this was done. While I was waiting my turn, I could not help looking at the wreck of the mizzen-mast, and a sad and painful sight was there; but what was wonderful, there, among the entanglement of masts and gear to leeward, we found the second-mate alive. When I say he was alive, it is as much as I can say, for he was almost insensible, and quite off his head. Poor fellow! I could see from the first that death was upon him; but for all that, though it was a risky thing to shin out on to that mast to get hold of him, it was done; and he was got safely into the boat. It is very easy to say we all got safely into the lifeboat; but when I think of it, it seems marvellous how it was done; but it was done, and done gallantly. It was a grand, a noble bit of work; and twelve men were thus rescued from the jaws of death. At last, the steamer was reached, the lifeboat taken in tow, and we steamed away for the North Foreland.

'Our poor second-mate died about half an hour after we left the wreck. We did all that was possible to do for him; but it was of no use. The wonder is not that he died then, but how he lived through that terrible night.

'When the danger was over, and we settled down a little, we found that the men who had rescued us were Ramsgate men, and that the lifeboat and tug belonged to that port. They had come eight-and-twenty miles, and lain by us during the whole of that tempestuous night, on the mere chance of saving us poor sailors. What I say is, that it was a grandly noble deed.

'Of the twenty-nine souls that left Middlesbrough in the *Indian Chief*, only eleven reached the land alive. Their names were—William Meldrum Lloyd (chief-mate), James Sanderson (pilot), Malcolm Smith, George Gilmore, George Harris, Andrew Peterson, James Springer, Edward Basham, Charles Gilbert, William Coombs, and Charles Swanson. This last had a most miraculous escape. He was in the mizzen rigging when the mast fell, and was for some hours in water; but at daylight, though his collar-bone was broken, he managed to get back to the ship, and was eventually saved.

'When I look back on the dangers and privations which we all had undergone during that night in the fore-top, and find myself alive and well, it seems like a dream.'

## HOW SIMON PEVERITT GOT MARRIED AT LAST.

MASTER WESTLEY, clerk and sexton in the small village of Woodham, was one winter's morning sitting by his cheery fireside, watching alternately the rain, fiercely beating against the latticed window-panes, and the brisk movements of his active little daughter, as she moved to and fro, busy about her household work. Presently she came in, bringing a hat, greatcoat, and umbrella, observing: 'You will be wanting these soon, father. It is nearly eleven o'clock.' She had hardly said this, when a loud knocking was heard at the outer door, followed by the abrupt entrance of a little middle-aged man in a state of great excitement, his face red, his hair rumpled, his boots splashed with mud, and his coat dripping with wet.

'Why, Simon, what on earth's the matter?' said the clerk. 'You don't look much like a bridegroom.'

'Bridegroom! No!' the little man exclaimed with bitter emphasis. 'Master Westley, you'll hev to tell parson I can't get married to-day.'

'Why, how is that?' asked the clerk.

'I can't get Mary up,' quoth the indignant and disappointed lover. 'I've been rattlin' at her floor, and throwin' stones at the winder, and shoutin' till I'm as hoarse as a rook; and I'm nearly wet through with the drippings from the hussens [the eaves of the house]; but I can't get she up. She only jest put her head out of winder for a minute, to tell me 'twor no good for me to stand hocketting [making a great noise] there; for she'd never take the trouble to put on her best things, and go out in that powerin' rain jest to marry me.'

'Why, Sim! this is rather a bad beginning for people about to marry—isn't it? I'm afraid the gray mare will be the best horse in your team—won't she?' said the kindly old clerk, with a merry twinkle in his knowing brown eyes. 'However, I'd better go and tell Mr Howard, or he will be putting his surplice on for nothing. Shall I say to him that perhaps the wedding may come off to-morrow, if the weather is finer, and Mary will get up in time?'

'If she don't,' vowed Sim, glaring vengefully, 'she shall never hev another chance. I'm fairly sick of her tricks. We've been keeping company this twenty year and more, and now she don't know her own mind a bit better than a mawther [young girl] in her teens. But I won't stand it no longer. She ain't going to treat me like a dog, or a mat for her to wipe her feet on. There's Widow Biggs would hev me any day, and glad; and a nice comfortable woman she is too! The wedding-ring shan't lie long in my pocket for want of a wearer. And there, Master Westley,' said poor Sim, almost in tears over his frustrated plans and disappointed hopes, 'I'd meant this to hev been a reglar jolly day. I'd got in a barrel of beer, and a spare-rib of pork, and we wor going to hev parsties and frawns [pancakes], and a mort of good things beside, to make a reglar spree of it;

and now, it's all knocked on the head, and everybody knows I'm made a fool of into the bargain.'

'Cheer up, Sim!' said Master Westley. 'It is aggravating, I'll own; but Mary isn't a bad sort, though she has rather a cruggy [crusty] temper. She has been very true to you; and it would be a pity for two such faithful lovers as you've been, to part over a little tiff at last. I believe Mary is jealous of the little widow. You know people did say once that you were rather soft on her.'

'It was a big story!' burst out Sim. 'She tried to hook me; but I never gave her no encouragement.'

'Didn't you walk with her from church last Sunday? I heard that you did, and carried little Joey all the way home; and kissed him when you put him down at his mother's door.'

'Well, he axed me to give him a kiss, so I couldn't do no otherwise. There wor no harm in that, sewerly.'

'Certainly not. Only, you see, as Mary lives just opposite, and saw it all, she very likely thought you'd be better engaged kissing her, instead of hanging round the widow's door. Depend upon it, she's jealous; and she's got a highful spirit of her own, and is acting like this to make you think she doesn't care whether she has you or no. If she thought there was real danger of losing you, she'd come round in a minute, as tractable as you like.'

'But how can I make her think so?'

'Well, you won't be doing any work to-day, and it's dull tilling [fiddling] about doing nothing. Take and brush yourself up smart, and go and have a chat with Mrs Biggs. Take some oranges and sweets for Joey. Don't look at Mary's house; and mind and make a grand show of petting and kissing the boy in front of the window, where she can see it all. She'll be more jealous than ever. But if she doesn't marry you to-morrow, I'll eat my head.'

'Ah, Master Westley, you're a deep one, you are!' said Simon, regarding his astute adviser with admiration. 'But it don't fare to be ezackerly jonnick [straightforward] to dew so; and I ain't fond of amarrin' babies over with kisses. Still, if you think it 'ull bring Mary up to the scratch, I'll e'en try it. If it don't, marry Sukey I will, without any more shilly-shallying.'

Master Westley then started for the rectory; and Sim paid his visit to the widow. He remained in her snug little house some time; and must have acted his part uncommonly well, for he had hardly reached home again, when he was visited by his old sweetheart. That eccentric spinster, ignoring her own wayward conduct that day, attacked Sim with a storm of reproaches, accusing him of fickleness and falseness in forsaking her for 'that sly, carneying, little widder; and after keeping company with me for so many years!' she plaintively added.

'No,' said Sim stoutly; 'twor no fault o' mine. I was ready to do my part this morning. It was you as run word. But I'll eat humble-pie no longer. If you don't want to hev me, I know one as does. I'll marry you to-morrow, if you like. If you don't, I'll never ax you again!'

Mary was a tall, black-eyed, comely looking spinster of forty or more, reputed to have a hot temper and a shrewish tongue; but for once she

kept both in check. It was evident that Simon meant to be trifled with no longer. Moreover, she could not help secretly admitting that he was right, and admiring his spirit and manly determination. It would never do to let so good a fellow and so faithful a lover fall a prey to a designing widow—not to mention the humiliation she would have to endure!

Next morning, the rain-clouds had cleared off, and a bright sun poured its rays through the old church windows upon Mr and Mrs Simon Peveritt as they walked from the altar-rails into the vestry, to enter their names in the parish register. Sim, with a broad grin on his face, laboriously executed a big black X as 'his mark,' informed the rector that he was 'a sawyer by trade' and that his 'owd gal had been of age this twenty year!' after which he turned to his friend the clerk, with a knowing wink, and said in an under-tone: 'We did it well between us, didn't we! Mary was up at six this morning, and hed to wait for me! I've got the whip-hand, to begin with; and I promise you I won't give up the reins agin.' Then he added in a louder tone, as they were about to leave: 'Now, Master Westley, you must come and help we eat the wedding-dinner. The pork and apple-sass will be none the worse for waiting a day; and my Missus and me 'ull make you as welcome as flowers in May. There won't be happier folks in Woodham. And, Master Westley, you shall hev some of the finest logs in my timber-yard, to keep up your fires this winter. I'm not the man to forget a good turn or an old friend.'

#### ONLY.

Jewels flashing in the air,  
Presents meet for kings who wear  
Diadems:  
Only dewdrops on the leaves,  
Which the wand'ring fancy weaves  
Into gems.

Fairy palace, tree-infolded,  
In the lines of beauty moulded,  
Bright and fair:  
Only sun-glints which are streaming  
Through the painted windows, seeming  
Rich and rare.

Sounds of wings celestial wheeling  
Through the heavens, and voices pealing  
On the breeze:  
Only evening which is falling,  
And the feathered songsters calling  
In the trees.

Till Phoebus in his beauty brings  
The gold-tipped Morning on his wings  
A-gleaming:  
And the many-hued creation  
Sets the Soul's imagination  
A-dreaming.

## DEGENERATION.

It may not be generally known that, amongst animals and plants, certain exceptions exist to the rule that living development means and implies progress. All animals and plants by no means attain as adults to a higher place and structure than they occupy at the commencement of their existence. Occasionally, the beginnings of life are in reality of higher nature than the completion of existence; and it can be proved that many living beings in their perfect state are absolutely of lower grade than when progressing towards maturity! It is to these curious facts in natural history that the collective name of 'degeneration' has been applied. The animal or plant which sinks or retrogresses to a lower place in the living world as time passes, and which thus develops backwards, so to speak, is said to 'degenerate.' It is of high interest to trace out several examples of this, and to note the inferences that may be drawn from them; since it may be shown that the analogies of degeneration may extend even to man's estate and affect even human destiny itself.

No condition of animal life is more effectual in inducing degeneration of structure than the adoption of a parasitic mode and habit of existence. The parasite lives on another animal or plant, and may be a lodger merely, seeking shelter and nothing more; or it may, when a typical parasite, depend upon its host for food as well as shelter. Such unwelcome guests are often a source of disease to the animals and plants which harbour them. But nature seems to revenge the host, by degenerating the parasite. An admirable law exists in nature, called the 'law of use and disuse.' Use and habit develop an organ or part, and judicious use increases the size and strength of living structures. Conversely, disuse causes atrophy, wasting, and decay of the organs of living beings. Applying this well-known fact to the animal which has adopted a parasitic existence, we can readily enough understand why a process of physiological backsliding is represented in its

history. With no need for legs or other organs of motion in its fixed condition, the parasite is in time deprived of these appendages. If it obtains its food ready-made from its host, nature will cause the disused digestive organs it once possessed for active use, to degenerate and to disappear. If at one time in its earlier career the creature was endowed with organs of sense, useful to an active animal, these will disappear by disuse when the parasite becomes fixed and motionless. There is, in short, no part of its structure which will not be affected, modified, and degenerated through disuse and it may be other conditions incidental to the parasitic life.

Illustrations of these remarks abound in the animal world. Take, for instance, the case of *Sacculina*, a parasite on hermit crabs. Each egg of a *Sacculina* first develops into a little active creature called a 'nauplius.' This organism swims freely in the sea. It possesses three pairs of legs, an oval body, and a single eye placed in the middle of its frame. Soon the two hindmost pairs of legs are cast off, and a kind of shell is developed over the body, and six pairs of small swimming feet replace the missing limbs. In this state it passes a short period of life, and the young *Sacculina*, like the majority of other animals, is apparently in the way of advance and progress. But the day of degeneration draws nigh. The two foremost limbs increase greatly in size; these members finally become branched and root-like; and the eye disappears along with the six pairs of swimming feet. The animal then seeks the body of a hermit crab; attaches itself by its roots, and then degenerates as the adult into the bag-like parasite whose roots, penetrating to the liver of the crab, absorb the juices of the crustacean host as food. Thus, a full-grown *Sacculina* is a mere sac or bag, which in due time develops eggs, and which drags out an inactive existence attached to the crab; water flowing in and out of the sac, by an aperture placed towards its lower extremity.

Another life-history which runs in parallel lines with that of the *Sacculina* is the develop-

ment of the barnacles, which attach themselves in large numbers to the sides of ships and to floating timber. Each barnacle consists of a body, inclosed in a shell, and attached to its floating log or ship by a fleshy stalk. From between the edges of the shell protrude some twenty-four delicate filaments, representing the modified legs of the animal, no longer used for motion, but serving, as a well-known naturalist puts it, to kick food into the barnacle's mouth. A digestive system exists, but there are no sense-organs in the shape of eyes. Now, the barnacle begins life as does the Sacculina. Its first stage is a three-legged oval-bodied 'nauplius,' which swims freely in the sea. This baby barnacle possesses a single eye, and a mouth and digestive system. Then it casts off its two hinder pairs of feet, and develops a shell and the six pairs of swimming-appendages, like the young Sacculina, whilst the two front-legs increase greatly in size. In this latter condition, the barnacle develops two large compound eyes in place of the single eye of its earlier stage. But the mouth and digestive system have disappeared, and the young barnacle's energies are now chiefly devoted to seeking a resting-place on floating wood. Fixing itself by the front pair of legs, and thus gluing its head to the object, the shell of the full-grown barnacle is soon developed, whilst the six pairs of legs become the brush-like tentacula wherewith food is swept into the mouth. A digestive system and nerves then appear, and barnacle-history may thus be regarded as complete. Nevertheless, a barnacle as a full grown animal is thus in some respects decidedly inferior to its youthful stages. Especially it wants locomotive powers; and its eyes are degraded; although, in possessing a digestive apparatus, it exhibits an advance on immature life. But the barnacle is not a parasite. It is merely a fixed and rooted animal, and as such has a necessity for a digestive system, which, as we have seen, disappears in the parasitic animal.

Degradation, thoroughly complete in Sacculina, and to a certain extent in barnacle-life, thus depends in the one case upon a habit of parasitism, and in the other upon fixity of body. The tendency of this process of backsliding is clearly enough seen in its power of rendering the adult—ordinarily a complex being—simpler in structure than the young. To impress these facts still more firmly on the mind, let us investigate the life-history of a species of prawn (*Peneus*) whose development runs in its earlier stages parallel with that of the barnacle and Sacculina. Prawns, lobsters, shrimps and crabs, form the highest division of the crustacean class. They greatly excel such forms as the barnacles in structure, as common observation shows. *Peneus*, as one of the prawn-group, begins life as does the barnacle or Sacculina, as a veritable 'nauplius,' with an oval body, a single eye, and three pairs of limbs. Then succeed other stages resembling those through which the crabs pass, and finally the features of the young prawn are in due course evolved.

From one common form, then, namely, the three-legged larva, which we name a 'nauplius,' we discover that animals so widely different as barnacles and prawns are developed. The fact testifies most clearly in favour of the idea, that

the development even of animals belonging to the same great class may vary in a most typical manner. The one development represented by that of the prawn proceeds along lines which are those of progress and advance; since the prawn is a much higher animal than its young. In the barnacle there is degeneration in some respects, but advance in others; so that the state of matters in the barnacle represents history intermediate between advance and decline. But in the Sacculina are witnessed degradation and retrogression of the purest type. The animal goes backwards in the world, until it sinks to the level of a mere tumour-like growth, attached to the body of its crab-host. Endowed first with powers of locomotion, these wholly disappear; furnished with an eye, that organ likewise vanishes away; and parasitism works its will on the animal's frame, degrading it to such an extent, that but for a careful tracing of its history, we could not have discovered that it was a crustacean at all.

The well-known animals we name 'Sea-squirts' present us likewise with examples of degradation arising, like that of the barnacles, from a habit of fixing themselves. Each sea-squirt or *Ascidian* resembles in shape a jar with two necks, as we find it attached to shells and other objects. Its whole frame is inclosed in a dense, tough, leathery membrane, through which the stimuli of the outer world can with difficulty pass. Yet the sea-squirt, rooted and fixed as it appears to be, begins life as a free-swimming tadpole-like being, which propels itself over the surface of the sea by means of its flexible and muscular tail. This tadpole-like body exhibits a superior structure in many respects in the eyes of a zoologist. For instance, it, of all invertebrate animals, possesses a representative of the spine or backbone of the vertebrates. It is the only animal which, like the latter group, has a nervous cord lying above this spine; it has an arrangement of gill-clefts like the fishes, and it has an eye which is formed just as our own eyes and as those of all other vertebrates are developed. Yet to what end is all this promise of high structure? Backsliding becomes the order of the day; the tail of the larva disappears; its internal organs are modelled on a lower type; its eye fades away; it fixes itself by its head, like the young barnacle; and it finally degenerates into the rooted, immobile sea-squirt inclosed in its leathery investment.

The topic of degeneration has, however, more extended applications than those which we have thus hurriedly chronicled as applying to the explanation of the lowness of some animal forms as compared with others. Physiology teaches us that there exists in all living beings from animalcule to man, a natural process of degenerative change, in virtue of which the worn-out particles of our tissues are perpetually being thrown off as their functions fail. The daily waste of our frames is in large measure a process of degeneration. Still more clearly is that process a degenerative one, which despoils us in old age of our teeth, whitens our hair, dims our eyesight, and wastes and changes in greater or less degree every organ and tissue of our body. So also, many diseases which affect us, apart altogether from the general breakdown and backsliding of structure that accompanies old age, are the results

of what physicians truly name 'degeneration.' Thus, so far from being any peculiar or abnormal action of life, degeneration is as natural to our existence and to that of living beings at large, as development and progress. The living being may in fact be said to occupy one of three positions in the universe of life in respect of the alterations to which it is subject. Either its race is progressing, or its species is declining and degenerating, or last of all, and more rarely, the living form is stable and at rest—in equilibrium, as one may put it. Nevertheless, there is no denying the fact that progress and advance are by far the most constantly represented condition of life. Were it otherwise, we should not find the universe of life so varied as it is; and the progress of development is by no means likely to be replaced to any momentous extent by the law of backsliding, whose effects we have endeavoured to describe.

The foregoing remarks would be imperfect, and even misleading, were we to fail to note that there is at least one aspect of degeneration in which it becomes related in the most intimate manner to both progress and advance. The development and rise of an animal in the scale of creation is accompanied as a rule by the disappearance of organs and parts which pertain to lower stages of life, and to its own immature condition. The tadpole in becoming the perfect frog exhibits degeneration in the disappearance of its tail; for the frog, as every one knows, is a tailless being. Then secondly, its gills degenerate and disappear through natural, or more popularly speaking, constitutional causes, inherited by the frog from its ancestors. Opposed to the degeneration of its gills is the independent development of lungs, which development evinces the higher nature of the lung-breather over the pure gill-breathing tadpole. Here, therefore, degeneration is working out the purposes of development. It is, in other words, wiping away and destroying the evidences of the lower nature which is being replaced by a higher stage and type of life. The young crab is tailed like the lobster or prawn; but degeneration of the tail converts the crab into a higher type of crustacean than the lobster, and internal change of like nature makes the perfect insect as well as the crab, a higher being than its larva.

If, therefore, we take a wide view of living nature—a view in which alone the true analogies of things are to be clearly perceived—we shall find degeneration at one time ruthlessly driving the animal form to lower confines of life; whilst at another time, we shall see the same process accompanying advance and progress hand in hand, and aiding the growth of the higher life by restricting and abolishing the evidences of the lower and imperfect existence.

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER XXIV.—BERTRAM'S LAST ATTEMPT.

WHEN the project of pushing on to Blackwall itself, and of presenting himself to Mr Mervyn as a suppliant for employment, for the first time took definite shape in Bertram's mind, the sun, which had shone so brilliantly through the short winter's day, was sinking in the western sky, and gleamed opalescent through the smoke of London. From the river, a gray mist was beginning to

rise, clinging, as yet, to wharf-edges, against which the lapping water washed, but gradually creeping higher as the evening darkened. Bertram had been walking, now, for many hours, and was faint and weary, and sick of heart. He was not quite destitute; but the two or three shillings that his slender purse contained were too precious to be wasted, so that although he looked wistfully at the steamboats snorting and splashing their way down-stream, and at the omnibuses that demurely passed him, with half-open doors, tempting a possible passenger, he still continued self-denyingly to walk on.

He had not accomplished the long distance which, in such bitter and biting weather, he had that day traversed on foot, entirely without more sustenance than the clear-starcher's lump of cake could impart. But a slice of cold meat and a piece of bread, purchased at a wayside cookshop, gave him only a temporary strength; and as he plodded on, he began to realise the fact that he was very tired indeed. He had gone far, and had still some distance to get over; but his tread was no longer elastic, as it had been when he started that morning from the Old Sanctuary in Westminster, and the bag which he carried felt strangely heavy as he trudged on.

What was Bertram to do, if he should reach the yard of Mervyn & Co. too late, after business hours, and after the head of the house had departed? This was a Saturday; and, should he fail in obtaining the interview which he sought, his next chance would be on Monday. 'Call again on Monday,' from the watchman or porter left in charge, would be the merest commonplace rejoinder to a belated applicant; but, like so many other commonplace replies that we meet with in the world, it might be little short of a sentence of death to the hearer. Bertram's few pence and shillings would, he knew, last him but a very little time, when he should have to lay them out in payment for the cheapest accommodation that he could find in any decent, humble house of entertainment. And how if Mr Mervyn should not, on Monday, attend at the ship-building yard? Or how if his prayer to be employed should be declined, courteously, no doubt, but still declined?

Bertram began to feel, now, that he had been rash in rejecting the alluring invitations of the omnibus conductors, as their lengthy vehicles went rattling past. Fourpence—sixpence—would have been well bestowed in the saving of his waning strength. Overmuch fasting, voluntary or enforced, does tell upon the stamina. Bertram had stinted and pinched himself, prudently, during the sad weeks that had preceded the total breakdown of Groby, Sleather, and Studge; and now even Youth, with its wondrous powers of endurance, could hardly buoy him up. But his heart was a gallant one, and gallantly he pressed on. Should he be in time? Anxiously he looked about him, turning his weary head, for another omnibus, another pier where steamers called. He saw neither.

'Cab, gov'nor!' bawled out the ruffianly driver of a shabby cab, wearing on his unkempt head the battered white hat, with a rusty strip of black crape ostentatiously adorning it, which in London streets might be excusably considered as rather the distinctive headgear of a savage tribe, than

the outward and visible sign of Christian mourning for a deceased relative. 'Keh, I say!' reiterated this delectable charioteer, waving his whip. 'Blackwall, hain't it!'

'Yes; but I do not want a 'cab,' answered Bertram gently.

'That's because ye're so mean,' bellowed the cabman, who was three parts drunk. 'Eighteen-pence won't break ye, I should hope. Take you for a shilling,' added the driver, with growing exasperation, as he saw his offer tacitly refused. 'Very well; jaul the hoof, you sneak!—And *you*, come up!' The last summons, backed by a succession of stinging whip-cuts, was addressed to his lean horse, whose welled neck and scored sides bore token to the spiteful humour of his brutal master; and off jolted the cab at a crazy canter.

Bertram Oakley pressed resolutely on. More ships, more wharfs. Would the wharfs and the ships, and the marine store shops, never end? Tired and giddy, as he rambled on, he marvelled at the black defaced dolls, with scripping woolly locks, that dangled over the greasy doors of these frequent emporiums; and wondered how empty bottles, scraps of rusty iron, lead, pewter, copper, how old rage and fresh dripping, came to be called marine stores. More ships, and then locked-up yards full of enormous anchors, broken capstans, old masts, coiled-up cordage—the shattered paraphernalia of ships. It seemed a dream, this long walk. The mist from the river had risen breast-high, like a shroud. The gas was flaring in shed and shop; and cheap viands, savoyes, hot pies, greens, fried fish, and potatoes cooked and uncooked, were being higgled over by plain-spoken sellers and shrill, slipshod customers of the feminine sex, with noisy children at their untidy heels. Still on.

Yes; the short-lived day was pretty well spent, the long night of mid-winter had almost begun. Hideous old boardmen, sandwiched between a brace of placards in large print, and with paper lanterns stuck on the crown of their frowsy hats, patrolled the streets, hoarsely inviting all and sundry to some neighbouring music-hall. Behind the thin red curtains of low public-houses which sailors patronise, lights glared, and fiddles squeaked, and there was silly riot and vapid laughter, as Jack Ashore, true to the traditions of his hazardous calling, spent in asinine fashion the pounds he had worked for at sea. Brawling knots of half-intoxicated people hung about the corners of the darkling alleys, and the policemen on their beat kept well away from the entrances of courts and the approaches to slimy causeways leading to the river, and moved along cautiously, like scouts in a hostile country, in the midst of wild hootings, outcries, and snatches of ribald song, that gathered force as darkness fell.

This—this, at last, must be Blackwall. Yes; that was the pier, to the right, at which Bertram had landed when first he visited the place in his capacity of a messenger from Messrs Groby, Sleather, and Studge. He remembered the baker's shop that stood opposite; the tobacconist's, hard by, with the obsolete wooden figure of the Red Indian above the door, supposed to present an accurate portrait of some American savage in the costume of his native country; and the public-house, the *Blue Anchor*, that seemed to be frequented by watermen rather than by sailors from

the vessels near, to judge by the fresh-water mariners who puffed their churchwarden pipes in its porch and bow-windowed parlour. Bertram had an excellent memory for localities. It served to guide him on, without losing his way, until he saw, dimly, through the twilight, the words 'Mervyn & Co.' painted in tall letters on the white board that topped the gate of the well-remembered yard.

'Hilloa! heave to, or, I'll know the reason why!' shouted a gruff voice, as Bertram set foot within the charmed precincts. The young man recognised the bark, so to speak, of the human watch-dog who guarded the place. 'I beg pardon; I have been here before,' he said with an effort to smile, as he halted. 'I hope I am in time to see Mr Mervyn?'

'What cheer, eh?' grumbled the janitor, bending his bullet-head forward to get a better look at the intruder.

'Is Mr Mervyn in his counting-house?' asked Bertram. 'If so, I want very much to see him for a moment.'

'Want must be your master, then, for he ain't,' was the surly response.

Bertram staggered. Weak and faint and ill, he had overtaken his waning strength to reach this place before business hours were over, never doubting that he should find the great ship-builder whom he sought. Curiously enough, although he had feared that Mr Mervyn—of the situation of whose private residence he knew nothing—might not attend at Blackwall on Monday, he had been all but certain of seeing him on Saturday, the hebdomadary half-holiday not having as yet become a parasitic British institution.

'Not here!' repeated Bertram, gasping, as he caught at the gate-post for support.

'Hasn't been here to-day, the Commodore,' said the veteran gate-keeper irritably. 'Have you got a letter? If so, leave it, and call for the answer.'

'No; I have no letter,' answered Bertram; 'but'—

'Then, sheer off, will ye, for I want to lock up the yard!' exclaimed the old sea-dragon, whose temper was on that evening shorter than usual. 'Monday, you can—— Why, what ails the youngster?' he added, half-ashamed of his roughness, as Bertram, repulsed from the gate, reeled, and caught at the strong wooden paling beyond, and then sank down, a helpless heap on the ground. Five or six workmen, freshly released from the yard, and who were lighting their short black pipes before starting on their homeward walk, came crowding up.

'Drunk!' was the verdict of one of these jurors, with a loud laugh at his own perspicacity.

'No; I don't think it—the chap's ill,' said a more thoughtful member of the group.

'Who's ill?' asked a pleasant voice, the modulated accents of which contrasted with the monotonous bass of the shipwrights.

'Only this young fellow, Mr Arthur. He was talking to Old Joe here, at the gate, and down he drops.—How goes it, mate?' said the workman, putting his powerful hand on Bertram's shoulder. Bertram, with haggard eyes, looked up. He saw, standing by, a pleasant-faced, gentleman-like young man, of perhaps five-and-twenty, with blue eyes and fair hair, manly and kindly of aspect.

'Did you want anything of us, my poor fellow?' asked the new-comer good-naturedly. 'But of course you do, or you would not be here, weak as you are. I think you can scarcely, by your face, be a hand in search of work.'

'Mr Mervyn's kindness, sir, emboldened me.'

'You know my uncle, then?' asked the gentleman who had been addressed as Mr Arthur. 'How did that come about? I never, to the best of my recollection, saw you here.'

'I came here last autumn,' Bertram said feebly, 'with a letter from my then employers, Groby, Sleather, and'—

'Is your name—let me see—Bertram—yes, Bertram Oakley?' exclaimed Mr Mervyn's nephew with sudden interest. 'If so, I have heard my uncle speak more than once of — There! the poor fellow has fainted.—One of you men had better run for some wine—or better, brandy,' he added, putting some silver into the hand of one of the rough, good-natured shipwrights who started forward at his call. 'You can get it within a stone's-throw of the gate.'

Some brandy was speedily brought; and Bertram was with some difficulty induced to swallow a portion of the fiery spirit. 'I am sorry—to give so much trouble,' he said in a weak voice, as he reopened his dim eyes and tried to raise himself from the ground. 'You are very good, sir, to a stranger.'

'But you see, Mr Oakley, you are not quite a stranger to me,' said Mr Mervyn's nephew genially, as he assisted Bertram to rise. 'It is not often that our Principal takes such a fancy to any one, on a chance acquaintance, as he did to yourself; and it was but yesterday that he was expressing a hope that you had met with more appreciative employers, since Messrs Groby's bankruptcy, as you were evidently fit for better and higher things than to be one of their copyists. But you seem very weak. You are not ill?'

'It is fatigue, sir—not illness,' Bertram replied. 'I have been walking since the early morning, and was worn out and dejected enough, when, after many rebuffs, I bethought me that I would get so far as this, if my strength held out, and'—

'And seek aid from us? and employment?' said the other kindly, as Bertram hesitated to complete the sentence. 'For the second, I think I can venture to answer; and for the first, I know I can. It will be strange if there is nothing, no berth in Mervyn's Yard, or Yards, for we have branch establishments elsewhere, in which you would be useful. But this is Saturday night, and you cannot see the head of the firm until Monday. I must find you quarters somewhere near, in the meantime.—Ah, the *Greyhound*, the old *Greyhound* will be just the thing—cheap and quiet, and with a decent motherly old landlady, a tenant of my uncle's, by-the-by; so, if you are strong enough, I will walk round with you, and recommend Mrs Andrews to take all possible care of her lodger until, about eleven on Monday morning, you call at the yard.'

'I trespass sadly on your time, sir, and on your kindness,' said Bertram, almost with a sob, as he walked slowly on by the side of his new acquaintance. The generous treatment I have received here, so different from some of the greetings I

have had to-day, has almost unmanned me. And I was weak, somehow'—

'I can guess how. Lean on my arm, and we shall soon be at the *Greyhound's* door,' said Mr Arthur hastily.

On our side of the Channel, to express gratitude is a pain; to be thanked, still more distressing. Now, Alphonse and Jules, and Fritz and Max, are always ready to throw up their hands and beat their breasts, and fall on each other in a fraternal embrace, when some trifling service has been rendered on either part. But, if we islanders are less dramatically effusive, we are, I think, readier and more graceful, in our plain insular way, in adjusting the relative positions of the helped and the helper. 'I must introduce myself,' said Mr Mervyn's nephew. 'My name is Lynn—Arthur Lynn. I am a partner; and indeed,' added the young man cheerfully, 'I believe I represent the "Co." in our firm, since nobody else has an active share in it now except Mr Arthur Mervyn, who is my godfather as well as my uncle. And you have not peached on my time at all. People dine late in London, foolishly late, to my mind.—Here we are. This is the bar-parlour, where you can sit down while I speak a word to Mrs Andrews here.'

The word was soon spoken; and then Mr Arthur Lynn said good-night lightly and kindly, as it was in his nature to speak, and left Bertram Oakley in good hands.

## SELLS.

### IN TWO PARTS.—PART I.

'PEOPLE who talk slang,' said the late Mortimer Collins, 'are those who either cannot or will not think; and there is no doubt that he is right. We have so many other contaminating influences creeping in daily and almost unavoidably to defile our 'well of English,' that the use of any gratuitous perversion of the language is certainly to be greatly deprecated. It nevertheless occasionally happens that such a word by common acceptance felicitously expresses the idea which it is intended to convey. 'Cheat, surprise, mistake, misadventure, *contretemps*'—none of these denotes so vividly as 'sell' that combination of circumstances resulting in discomfiture to some one. The following are a few examples of Sells proper, which, it must be borne in mind, are apart from that vulgar form of practical joking which is termed *hoaxing*.

A soldier, wishing to get his discharge, shammed deafness so successfully, that all the medical men who examined his case were deceived by him. No noise, however sudden or unexpected, had any power to disturb his equanimity; and he had acquired such perfect control over his nerves, that a pistol fired over his head when he was asleep did not—apparently—awake him. Grave suspicions as to the genuineness of his malady were entertained, notwithstanding. Like most malingerers, he was a little too clever and complete. Still, it seemed impossible to catch him tripping. A final examination was made; the doctors expressed themselves satisfied; and the soldier was presented with his certificate of discharge. Outside the door, he met a comrade, who whispered: 'Have you got it?' with an appearance

of eager interest. 'Yes; here it is!' was the unguarded reply. But the certificate, though filled in, was not signed, and the malingerer was a sold man.

Some time ago, a very amusing 'sell' was narrated in the pages of a magazine. A physician being summoned to attend a miser's wife in her last illness, declined to continue his visits unless he had some legal guarantee for payment, as he knew by experience the slippery character of the husband where pecuniary obligations were concerned. The miser thereupon drew up a document, formally promising, after haggling over the amount, that he would pay to Dr So-and-so the sum of £ —, 'if he cures my wife.'

'Stop!' said the doctor. 'I cannot undertake to do that. I will treat her to the best of my ability; but she is very ill, and I fear she will not recover.'

So the sentence was altered to, 'For attendance upon my wife, kill or cure,' the paper signed, and delivered over to the physician. His skill was unavailing, and the patient died; but when the bill came in, the widower quietly repudiated the debt *ipso facto*. In vain was it represented to him that the doctor held his legal acknowledgment; so the latter sued him for the amount in perfect confidence of gaining the day. The miser did not dispute the circumstances in court, but requested to see the document, which he then read aloud with great deliberation.

'And *did* you cure my wife, sir?' he asked, glancing over his spectacles at the plaintiff.

'No; that was impossible.'

'Did you kill her?'

Verdict for the defendant. Doctor sold.

An Irishman, finding his cash at a low ebb, resolved to adopt 'the road' as a professional means of refreshing the exchequer; and having provided himself with a huge horse-pistol, proceeded forthwith to the conventional 'lively common,' and lay in wait. The no less conventional 'farmer returning from market with a bag of money' of course soon appeared, to whom enter Pat with the regulation highwayman offer of choice, 'Your money or your life!' a remark fortified by the simultaneous exhibition of the firearm in the usual way. The farmer, who was a Quaker, essayed to temporise. 'I would not have thee stain thy soul with sin, friend; and didst thou rob me of my gold, it would be theft; and didst thou kill me, it would be murder. But hold! A bargain is no sin, but a commerce between two honest men. I will give thee this bag of gold for the pistol which thou holdest at my ear.' The unsuspecting amateur Macheath, yielding perhaps to the Quaker's logic and solicitude for his spiritual welfare, made the exchange without a moment's hesitation. 'Now, friend,' cried the wily Ephraim, levelling the weapon, 'give me back my gold, or I'll blow thy brains out!' 'Blaze away, thin, darlint!' said Pat. 'Sure, there's niver a drop of powther in it!' The result was a sold Quaker.

The old sailing-ship yarn about the rollypoly pudding might come under this category. There was only one passenger on board the vessel, who took his meals in the after-cabin with the captain and mate, and who always suspected—not without

reason, it may be—that those two worthies defrauded him of his due share of the catables when they got the chance. One day a jam pudding or rollypoly appeared at dinner, just enough for three; and the passenger, who had a sweet tooth, was instantly on the alert to see that he got his fair and proper third. 'Mr —, do you like puddin'-ends, sir?' the captain asked, with his knife poised in air ready to cut the delicacy. 'No; I do not like ends, sir,' replied the passenger, who considered that he had as much right to the middle slice as any one else. 'Ah, well, then, me and my mate does!' was the gallant commander's observation, as he cut the pudding in two and deposited half on the mate's plate, and half on his own.

At a large hotel in Suffolk, the not uncommon dilemma arose of there being only one room in the house vacant when two visitors required accommodation for the night. It was a double-bedded chamber, or was soon converted into such, and the two guests—who were both commercial travellers—agreed to share it. One of these gentlemen was a confirmed hypochondriac, and greatly alarmed his companion by waking him up in the middle of the night, gasping for breath. 'Asthma,' he panted out; 'I am subject to these spasmodic attacks. Open the window quickly; give me air!' Terrified beyond measure, the other jumped out of bed. But the room was pitch-dark; he had no matches, and he had forgotten the position of the window. 'For heaven's sake, be quick!' gasped the invalid. 'Give me more air, or I shall choke!' At length, by dint of groping wildly and upsetting half the furniture in the apartment, the window was found; but it was an old-fashioned casement, and no hasp or catch was to be discovered. 'Quick, quick; air, air!' implored the apparently dying man. 'Open it, break it, or I shall be suffocated!' Thus adjured, his friend lost no more time, but seizing a boot, smashed every pane; and the sufferer immediately experienced great relief. 'Oh, thank you; a thousand thanks. Ha!' he exclaimed, drawing deep sighs, which testified to the great comfort he derived; 'I think in another moment I should have been dead!' And when he had sufficiently recovered, and had expressed his heartfelt gratitude, he described the intense distress of these attacks, and the length of time he had suffered from them. After a while, both fell asleep again, devoutly thankful for the result. It was a warm summer night, and they felt no inconvenience from the broken window; but when daylight relieved the pitchy darkness of the night, the window was found to be still entire! Had invisible glaziers been at work already, or was the episode of the past night only a dream? No; for the floor was still strewn with the broken glass. Then, as they looked round the room in amazement, the solution of the mystery presented itself in the shape of an antiquated bookcase, whose latticed glass doors were a shattered wreck. The spasmodically attacked one was cured from that moment. So much for imagination!

Some years since, a wealthy eccentric old gentleman, living at the West End of London, devoted the whole of his large fortune to the purchase of a collection of rare and beautiful jewels; and the contemplation of these became his sole pleasure

and occupation in life. Leading a very lonely existence as he did, it is not to be wondered at that a natural fear of burglars deepened at last in his mind into a morbid dread of being robbed; and in terror lest he should be deprived of his treasure, he caused a small room to be built in his house wherein he might deposit his valuables; and being an ingenious man, he constructed and arranged in it a sort of *mitrailleuse* of pistols in such a way that whoever opened the door would receive a dozen bullets on the spot—a condition which might well appal the stoutest-hearted diamond-fancier that ever came out of Newgate. The arrangement was rendered harmless to the owner by the manipulation of a certain secret string, known only to himself. But alas! no sooner was the thing fairly completed, and in comfortable working order, than the string slipped from his fingers one day as he was closing the door, fell down inside, and from that moment his collection of precious stones was as inaccessible to himself as to any burglar alive! Seven years after this, he died, having spent the greater part of that interval in gazing sully at the door which he himself had shut upon all he held dear on earth. A full account and explanation of the circumstances were found in his will, in which all his property was bequeathed to a married niece and her husband.

But all his property had been invested in those glittering crystals, and they were locked up behind that guardian door; and a battery of pistol-barrels is just as fatal to lawfully inheriting married nieces and their husbands as to feloniously acquisitive nocturnal visitors. What was to be done? After much deliberation, consultation, and investigation, the legatees came to the conclusion that there was nothing for it but to effect an entrance into the back of the closet through the wall of the next house. Here another difficulty occurred. The landlord of the adjoining residence objected to having his wall knocked down on any consideration. Well, then, would he sell the house? Yes; at a price. He was told to name his own terms; and probably did not understate the value of the premises. Be that as it may, the house was bought; and then came difficulty number three. The tenants then in possession had a large portion of their lease unexpired, and they too had objections to breakage. But it was not a time to stand on trifles, and money was 'no object' with such a fortune at hand, so they also were bought out on their own terms. Then the wall was breached, the treasure-chamber reached in safety, and found empty of all but a species of huge revolver—a deadly piece of mechanism, but of no great intrinsic value. Somebody else had been beforehand in getting through the wall!

The humour of the situations in many old comedies and farces depends upon 'sells' of some sort. Husbands make love to their own wives in disguise at masquerades; one individual hears his character disparaged in the third person by another, who has no idea whom he is addressing; or the villain unwittingly selects as his accomplice the man against whom his machinations are directed.

At the Queen's Theatre one night about ten years ago, during the representation of a play at which the writer was present, a burst of applause

rose from the audience as an actor made his entrance in the second scene. He was no celebrated artist or public favourite, but an ordinary 'walking-gentleman,' unknown to fame, who played one of the minor parts, and seemed a little puzzled—as well he might—to account for such an enthusiastic reception. There was no doubt about it, though; the house rang with plaudits from pit to gallery; so, thinking that the public had at last awakened to a perception of the merits of true genius, he stepped forward to the footlights before commencing to speak his part, and by bowing five or six times, expressed his thanks for such a flattering ovation. And then the house rang again, but now with laughter and ironical cheers; and the poor actor became aware that the Prince and Princess of Wales, who had just entered the royal box, were the real recipients of the greeting he had so gracefully acknowledged.

The three-card trick as played at fairs and on racecourses is familiar to many; it is so old, and its mystery so well known, that it is wonderful any one can still be found to be duped by it. The performer, who is seated on the ground, shows two cards in one hand, a court card below, and a plain one above; and another plain card in the other hand. The three are then thrown down backs uppermost in a row; but although the court card is apparently placed in the centre, it is absolutely impossible for the quickest eye to detect whether it or the plain card falls first, the latter slipping imperceptibly over the picture card. He then bets that no one can tell which of the three is the court card. Those who are in the secret could no more follow the action than the merest novice; and if, under these circumstances, one bets on the position of the court card, the odds are really two to one against him. If the trick ended here, it would be open to no greater objection than any other form of gambling, and there might even be something to admire in the dexterity exhibited by the prestidigitator. But, unfortunately, a swindling element is generally introduced. One, two, or more confederates—technically known as 'bonnets'—artfully made up as farmers, or 'swells,' or something as unlike the rough card-manipulator as possible, mingle with the crowd, and by a preconcerted signal, of course always hit upon the court card, and win large sums of money. Encouraged by the spectacle of their success, the public put their money on; but somehow the same luck does not seem to attend their ventures; they do not guess the right card; and after a time, the game flags again. Then the performer looks away for a moment, on some pretext or other; and while his head is turned, one of the 'bonnets' steps forward, slyly lifts the picture card, bends one corner of it, and replaces it. The card performer then addresses himself to his business again; he again lifts the cards and once more shuffles, and places them without taking any apparent notice of the bent card. There is accordingly a rush to bet on the card with the bent corner—which is the wrong one after all! When the operator picked up the cards to throw them again in position, he rapidly and invisibly straightened the turned-up corner of the court card with his thumb, and at the same time bent one of the plain ones. So much for the

three-card trick as usually performed, and concerning which I trust my young friends may be strenuously on their guard.

Now, let me explain a special modification of it which I once saw on the towing-path at Putney, on one of the practice-days before the Oxford and Cambridge boat-race, and which involved a really very pretty bit of sleight-of-hand. The ordinary *modus operandi* had been carried out; the regular business of lucky confederates, corner-bending, and all the rest of it, was gone through; but somehow the bystanders who formed the circle seemed too wary to be trapped by such chaff as that, and neither the 'farmer's' lingo nor the manipulator's assumed carelessness induced any of the amateurs to tempt fortune. 'Won't any o' you gents behind try yer luck?' said the squatting performer, negligently dropping the cards and turning round, whereupon the honest agriculturist immediately lifted the middle one so that all could see it was the court card, and replaced it face downwards as before. 'I puts vive pund on that keerd,' exclaimed the farmer, 'if you doan't touch it agen!' Others would stake money on it too, on those conditions, which the performer did not seem inclined to accept. At last, however, after much demur, he agreed; a considerable sum was bet; the card—which he had not touched—was turned over, and was *not* the court card! A loud murmur arose from the dupes; cries of 'Duck him!' were heard, and for some moments the swindler's personal safety was endangered. But he turned the tide of popular opinion in his favour by appealing to the justice of the crowd. 'They tried to cheat me,' he shouted; 'they took advantage of me when my face was turned away; they'd have done me if they could, and now they goes for me when they finds themselves done instead. They tried to be rogues, and took me for a fool; but if there's bigger rogues than they, there's bigger fools than me!'

Such logic was irresistible. But how was the card so adroitly changed? The guileless farmer—who disappeared directly the row began—must have had a plain card in his hand when he stepped forward, which he exchanged for the court card as he put the latter down, by the process known among conjurers as double-palming. It was the neatest thing I ever saw, and the amateurs were decidedly, and very properly, sold.

The following anecdote is related as having actually occurred not many months ago in a large northern seaport city in England; and we have no reason to disbelieve it.

It was a Sunday, and it was raining as it never does rain but in the vicinity of mercantile shipping on the first day of the week. The docks boasted a little church or Bethel, which hoisted the Union-jack every Sunday morning, in token that service would be held there, chiefly for sailors. The clergyman who officiated weekly at the Bethel happened to be rather later than usual on the Sunday morning in question, owing to the difficulty he had in getting a cab, the rain having caused those vehicles to be in great demand. He arrived, however, a few minutes before eleven, and hurriedly bidding the driver wait for him till service should be over, he entered the sacred edifice—to find himself alone there. Possibly, sea-

faring people are not more prone to church-going in wet weather than their fellow-sinners who live ashore; anyhow, every seat was vacant. The clergyman was a zealous man, so he resolved to wait a quarter of an hour, on the chance of some waif or stray turning up. His patience was not unrewarded; for after the lapse of a few minutes, one very wet man came slowly in, and seated himself with some hesitation on one of the back benches. Even he, probably, had only put into that haven under stress of bad weather outside, all the public-houses and other congenial places of shelter being closed. Now, our parson was not only a zealous but a conscientious man—not always the same thing—and he resolved that had he but one solitary unit instead of a congregation, he would pursue the service in full to the bitter end for that unit's benefit—at least, as long as the unit would bear it—and he proceeded to do so, and accomplished it. At the end of the liturgy, touched probably by the patient endurance of his auditor, he condescended to address him personally, telling him that since the inclemency of the weather—we are not in receipt of information on the point, but we feel sure he said inclemency—had prevented the usual attendance at the church, he would forego the sermon he had prepared, and would content himself with making a 'few remarks.' This, however, his hearer begged him not to do, and expressed a great desire to hear the sermon; so, pleased with this evidence of intelligence among the lower orders, and gratified by the effect his eloquence was producing, he took the victim at his word, and let him have it. The text duly chosen, blossomed into firstly, secondly, thirdly, fourthly, and lastly; 'in conclusion' was followed by 'one word more,' and still the unit sat on undismayed. After it was all over, the preacher came down and shook hands with him, thanking him warmly for his attention; his gratification being somewhat diminished when he discovered the enraptured listener to be *his cabman*, the sum-total of whose 'half-a-crown an hour for waiting' had been materially augmented by the length of the worthy divine's discourse.

## BUSINESS AND MATRIMONY.

BY A SOLICITOR.

I HAVE had a bad day of it—a bad, unsatisfactory, tiresome, wearing day. Things have gone wrong with me. I have been snappish and unreasonable with my clerks. My relations with my partner, usually working without friction, have jarred disagreeably. I have made several stupid mistakes, and generally mismanaged my business. Heart and head have alike ached. My digestion has been upset, and lunch has disagreed with me. I have successively lost three pens, my blue pencil, my red ink, my india-rubber, the second volume of Pricedaux' *Precedents of Conveyancing*, the statement of claim in *Brakelegge and Wife v. the Accidental Railway Company*, and my receipt stamps. These several articles have been restored to me by a trembling clerk from various corners of the office where I have myself at sundry times deposited them. I have inked myself and my linen until soap is

a mockery and pumice-stone a delusion. I have been of no advantage or profit to myself, my clients, or any one connected with me.

Has any great misfortune in business or society come upon me? Is there a bill due to-morrow which I cannot meet? Are my clients falling away? Did I sup last night on pork-chops, Welsh-rabbit, lobster, or pickled salmon? Nothing of the kind. The simple explanation of all my woes is, that at the conclusion of breakfast, and just before I left home, I had a quarrel with my wife.

It was nothing—a storm in a teacup, or rather in a coffee-cup, as usual. About ten inches by three of the above exhilarating but penetrant fluid on the clean white table-cloth. A little natural indignation on the part of the mistress at the blemishing of her otherwise spotless napery, accompanied by a few observations, better left alone, about stupidity, awkwardness, and the like. A quick and slightly sarcastic retort, delivered in my best manner. An angry and rather rude rejoinder from the wife. A decided but harsh set-down from the husband, and the mischief was done. Words were spoken—foolish, unreasoning words—which were none the less bruising and damaging that each of the parties would afterwards be perfectly well aware that the other 'didn't mean what he' or she 'said.' There was brutal, blind wrath on the man's side; there were bitter reproaches and cutting insinuations on the woman's. You understand the whole silly business.

I have conquered, of course. Am I not a man? Is it not my right to rule? Shall I not be 'master in my own house?' Shall I 'submit to be addressed in that tone?' And so forth. Yes, I soothingly flatter myself, coward that I am, that I have made her say she was sorry, and beg my pardon. Having asserted what I call my marital dignity, I grant easy terms, and peace is signed with tears and kisses. Having missed two trains and an important appointment, I stride forth from my home, victor in the domestic battle. And I have the satisfaction of seeing looking after me a white and sorrowful little face, with the semblance of a tearful but all loving smile struggling to be visible, instead of the laughing look and merry nod which usually speed me on my way into the fight for existence.

And all day long the victory has recoiled upon the victor, and I may say, with the great captain of old, that many such successes would cost me—I do not care to think what. How will she bear the long day in the dull childless house, with the remembrance of her husband's harsh voice and angry words? Will such enlivening distractions as the whirring passage of the butcher's cart—the mechanical melody of the stray Savoyard, tempted for his sins into that unremunerative suburb—or the hoarse summons of the milkman demanding admission for his misnamed fluid, be sufficient to chase the gloom from her brow and the heaviness from her heart? It is to be feared not. But then, she was clearly wrong. She had not any business to go losing her temper because I accidentally upset my coffee, and say I was stupid and awkward. Of course I was quite

right to let her see plainly that I would not stand such nonsense. Equally, of course, I only spoke to her like that, for her own good. It is better for her to suffer—as I know she is suffering now—because it will conduce hereafter to her happiness, by establishing firmly in her mind a proper understanding of our mutual relations. And finally, it is all nonsense, and there will never be any peace in the house if I am always to—

I am afraid that last sentence conveys the most correct notion of my state of mind at the time. Did I go quite the right way to work? Was I entirely actuated by the laudible and conscientious motives above set forth? Was there no rudeness and bitterness, no want of consideration—how about that little headache with which she got up?—no self-conceit or stubbornness on *my* side? I am a hard-headed, hard-listed man of business, rugged and roughened from incessant contact with the asperities of life. My wife—in confidence, reader, she is much younger than I—is a sensitive girl, accustomed from her childhood to be admired and petted; a woman devoted to her husband, and loving him so much, that every hasty word he utters is to her as a cruel stab—a love which might surely excuse a little constitutional hastiness of temper. Could I not have borne the momentary irritation, and thereafter, at a more fitting season, have spoken gently a few words of loving remonstrance, which would have left behind them no sore feeling on either side; instead of 'carrying on' ridiculously, stamping my foot, and smiting my fist—to its detriment—against the furniture? Whereas, I can now only feel that I have done that which is a mistake both in social economy, in mechanics, and in law—that I have used more force than was necessary.

Now, I am going to suppose a case such as I know to be that of very many as I write—that is, the case of a young man of business, newly married, as yet without children, and with just sufficient means to maintain a small house in a suburb at some distance from his place of business, and without the means of keeping up a circle of acquaintance; so that he and his wife are sojourners and strangers in the land where they dwell, dependent entirely upon one another for company and comfort in their own nest.

Do not, I say to such a one—assuming that you and your wife love one another—begin the day by a quarrel with her. If you must quarrel—and I am afraid that, however devoted to one another, you will have your occasional tiffs—put it off until you come home. Then—a night intervening—there will be time for the consequent soreness to wear off. But if you value your happiness and peace of mind, and the unconscious digestion of your meals consequent thereon—if you have any desire that the long hours without you shall not be to your wife duller and more cheerless than is inevitable, do not found your day upon a matrimonial disagreement. You, remember, are going to your business, to do battle against the grim wolf which is ever hungrily watching your door, and your capabilities will be by no means improved by the consciousness that you have left unhappiness where you would wish all to be happiness and peace. But you, at all events, will have something to distract your mind, to keep you from inordinate brooding. What will *she* have? Her household duties, you will say—her work, her

walk out, her book. Alas! these want the varied and interesting character of the business which occupies *your* day. They are too mechanical; they run in too unvarying a groove to take from her the mental leisure which she will infallibly employ in eating her heart over your cruel words and looks.

Business men for the most part have no idea, or rather forget to remember, how lonely a life is often led by their wives in the early days of married life. When the young ones have arrived, when prosperity has brought with it its increased social duties, this evil will have vanished. But at first, into what sort of an existence do you imagine, my friend, you have introduced a young and inexperienced girl who has been induced by the contemplation of your many mental and bodily excellences to forsake, it may be, the snug companionship and merry prattle of a family of brothers and sisters? Do you not feel that her ears must ache with the deafening silence of the house, that the longing for an occasional loving word or pleasant smile, for a sympathetic ear into which to pour her little prattle of household events—ancient the turpitude of the cat, the doubt as to the success of a novel pudding, the stupidity of the servant, the possible becomingness of a contemplated cap—that this longing must weigh very heavily sometimes upon the girl you leave behind you? Do not, then, give her for a companion in the dreary house, and the solitary walk which constitutes her recreation, the image of yourself with a black frown and a stern eye, and sarcastic or angry words upon your lips.

The advantages of what I will call the 'sub-urban system' are few, and its evils, as it affects matrimony, are many. In the old times, before gigantic trade and overwhelming population made every foot of the essentially 'business' quarter of the town more precious than gold itself, the merchant-prince or the wealthy banker lived over his premises; and over the same he not unfrequently entertained royalty. Now, it is only the doctor who does this; and even he also has often his consulting rooms at a distance. Then, the husband and father was always on the spot, and within call of his wife and family; now, he is scarcely anything but a lodger, spending the greater part of his life away from them, and his home is little more to him than a place wherein to sleep. No doubt it is good for him to disconnect himself entirely from his work at the close of business hours, and to surround himself with entirely fresh scenes and interests. Perhaps, if he lives fairly out of town, the change to a purer air may be a benefit. He may derive health from the exercise which he takes in going to and returning from his office or chambers, and which otherwise he might neglect. But having said this, we have said all, or almost all.

If there be no family, but only the husband and wife, then the wife will be dull and lonely, nine times out of ten, in the empty house without her husband. She might not, truly, see much of him, even if his business were carried on at home. But the knowledge of his being there would be sufficient—an occasional glimpse of him would satisfy her. If, on the contrary, she be fond of society, and have many friends, the case will not be much improved. She will not be dull and wretched, no doubt; but then she will probably

be a gadabout. If she be not herself a gadabout, gadabouts will call on her, interrupt her household duties, and possibly endeavour to induce her to rebel against her husband. Man is the salt, the condiment without which the otherwise delicious compound called Woman speedily becomes rancid and unprofitable.

We shall not go back again to live over our shops. But against these evils there is happily provided a remedy simple and old-fashioned, but sure, certain, and palatable. It is called Love. And this same Love, if it be strong enough to 'make the world go round,' as the song says it is, will be also strong enough to make every man's own peculiar little globe revolve without friction. If the husband is obliged to spend a third of his life away from those he loves, let him be careful always to be with them as a kindly and pleasant remembrance. Let the wife take heed that her welcoming face shall be ever as the evening sun after a stormy day, chasing away from her husband's life the overhanging clouds, and lulling to rest the winds that have roared around him. Let each give the other cause to regard those hours when they are together, as a retirement into a shady and pleasant garden, where for both is to be found rest from all labours and troubles. So shall they still be near the one to the other, though they be apart; and so shall the sweet spirit of home be upon them both, making the rough highway of life smoother for the man, and cheering and enlivening for the woman its quiet and uneventful by-paths.

## THE STRANGE STORY OF EUGENIA.

### CHAPTER I.—STORNHEIM.

TWENTY years ago, I was sent from London with despatches to the court of the reigning Prince of Blankenwald. His Serene Highness received me with all courtesy; but the object of my mission was delayed in its attainment by the illness of his Prime-Minister, the Graf von Stornheim, without whom the Prince would do nothing. Weeks dragged on, and I received some sharp letters from the Foreign Office. On venturing a respectful remonstrance to His Serene Highness, he sent me to the country-house of the Prime-Minister with the necessary papers and full authority to act in concert with him. Two hours' drive from the capital brought me to Stornheim. The Graf's house was a large one—more comfortable than splendid in appearance, and situated in noble extensive grounds. On my arrival, I was at once ushered into the presence of that dignitary. He had left his bed for the first time for many days, in order to receive me; but was unable to rise from a day-couch, where he was half-sitting, half-lying, after a recent torturing fit of gout. After the perusal of some papers, and a few minutes' talk, he begged me to leave them in his hands, to look over more minutely, and in the meantime to take some rest and refreshment. He was compelled, he said, smiling, to hand me over to the care of his wife, who was fond of my country-people, and was never so pleased as with an opportunity of returning the kindness she had received during a visit to England.

After a change of dress, which my journey had rendered necessary, I was conducted into a reception-room, where several ladies were seated. The eldest, Madame von Stornheim, advanced to meet me, and with a mixture of kindness and dignity, apologised for receiving me quite *en famille*. Her husband's illness had, she said, driven all their late visitors away, and they had had no time to collect others to meet me. There was, I thought, in this speech, kindly as it was said, a pretty clear hint that the presence of strangers was not desirable at Stornheim, and that I should not be expected to linger when my business was accomplished. I of course only noticed the agreeable part of the speech, and replied that such an apology was quite uncalled for, expressing a pleasure in finding myself in so charming a family group. The Gräfin and her three daughters were all tall, handsome women, in the German style, that is to say, with splendid fair complexions, and features and figures good, though somewhat heavy. She introduced a fourth lady as a niece of her husband's, the Gräfin Eugenia von Oberthal. In the last-named lady I immediately felt a strong interest. She was the most beautiful woman I had ever seen, and a complete contrast to her cousins. Slender and elegant in figure, she had a delicate oval face, perfectly regular features, a brilliant brunette complexion, and silky black hair.

Dinner was shortly announced; and during that meal I quickly became acquainted with my fair companions. Like most German women, they were accomplished linguists, and challenged me to talk with them in English, French, or Italian as I chose. Eugenia von Oberthal was the most silent; but when she spoke, I was struck with the judgment and sense of her remarks; or perhaps her singular beauty had predisposed me to be favourably impressed.

Before night fell, I had another interview with Graf von Stornheim. The precision and clearness of his views, and the mastery he had already obtained over the difficulties that had beset my mission, convinced me that he had not unjustly acquired the reputation of being one of the ablest men of his time. But I was not sorry that even his skill and influence could not prevent the accomplishment of my mission from taking some weeks to perform, and that he begged me to take up my abode at Stornheim until the end was attained.

It is not necessary for the telling of my story to allude again to my diplomatic labours. It is sufficient to say I was detained, not unwillingly, late into the autumn at Stornheim. Shooting-parties were organised in my honour, and walking and riding excursions were of frequent occurrence. Eugenia von Oberthal—*die schöne Gräfin*, as she was usually called—never joined these parties, nor could I recollect that she had once accompanied us out of the park. On my remarking her home-keeping habits, she calmly replied that she preferred staying with the children. Another peculiarity I observed in her was, that though always well dressed, and with a taste and elegance in which German women are generally strikingly deficient, she had always a cord round her beautiful throat, with the free end hanging down in front. It was precisely and most uncomfortably like the fatal noose with which Jack Ketch invests his patients. On one occasion, when our acquaint-

ance was far enough advanced for me to venture on a joke, I rallied her on the simplicity of her taste, and the plainness of the necklace she had chosen. A sudden silence fell on the company; one cousin became deeply interested in a photographic album; two walked away into the conservatory; and Madame von Stornheim, with an evident effort, began talking of some widely foreign matter. My curiosity was now piqued, and I determined to learn all I could about *die schöne Gräfin*. With this view, I tried to pup up a younger son of Graf von Stornheim, who had returned from college. But I heard little from him that I had not already learned. Eugenia was a widow; though only three-and-twenty, her husband had been dead two years, leaving her with an infant, who died shortly after its father.

'Were her habits of seclusion consequent upon grief for the loss of her husband and child?' I asked.

'Probably,' was the dry reply.

'And the cord she wears round her neck, is it the insignia of some religious order?'

'What do I know? Women are fanciful, especially young and pretty ones.' And the young fellow puffed away at his cigar, with an air that seemed to say he had dismissed the subject.

I had been for some time aware that I was smitten with Eugenia, and I was now anxious to learn if my feelings were reciprocated. She seemed pleased in my society, and talked freely and readily with me. But she was too frank, too unembarrassed for love. Here again, I was thrown into doubt. This unreserve seemed a part of her character. I had never met a woman of her culture and station so direct and almost abrupt in speech and action. Circumlocution and hesitation seemed unknown to her. Her refined beauty and softness of voice and manner made her actions and words irresistibly pleasing. But when you recalled them in her absence, and the charm of her person and manner was wanting, you felt pained and offended by the recollection of something bordering on rusticity and bluntness. The longer I thought, the more undecided and irritated I became. The discomfort was insupportable; and one morning I determined to put an end to my doubts in the only effectual way. It was a morning of which every trifling incident is engraved on my memory with painful clearness. I had risen early, and thrown open my bedroom window to admit the fresh morning air. The suite of rooms assigned me at Stornheim looked out upon a noble terrace, from which you commanded a view many miles round of a varied and densely wooded country. But beautiful as was the scene, my eyes were quickly withdrawn to one more beautiful still. The cheerful sound of Eugenia's voice, and the shouts and laughter of a childish one, made me turn my eyes from the landscape and look upon the terrace. There was Eugenia running at full speed, carrying a child of five years—a grandson of the Graf's and a great favourite—pickaback. She flew like an arrow along the terrace, her little burden evidently in high delight. He had got hold of the hateful rope, and was pulling at it, imitating the sound by which we encourage a horse to full speed. 'You hurt me, Carl—you hurt me,' cried she in vain. Then falling on her knees so as to bring

the child's feet near the ground, she put him down, and with both hands loosened the rope, which had become taut with the child's pulling at it. While in this position, she looked up and saw me at the window; and nodding a cheerful good morning, took the child up again and darted away out of my sight.

Something in this scene, momentary as it was, inexpressibly shocked me. That hideous rope suggested thoughts so incongruous with the freshness, beauty, and grace of her who bore it! 'Was it, as the young Von Stornheim had suggested, worn for a whim, or was it inflicted as a penance for some?'—I could not finish the sentence. Crime and sin were impossible to such a creature; it was profanity to associate such ideas with her. I recalled all I knew of her—the strong affection of her cousins; the innocence and usefulness of her daily life; her popularity with the children, to whom she devoted many hours of her day, playing with them, teaching them, and often nursing them. While thus thinking, I unconsciously made my way down-stairs, and through a door on to the terrace.

Eugenia was now returning, leading her little companion by the hand. Flushed with exercise, her eyes sparkling, her hair blowing about her face, and laughing with almost childish glee, her beauty struck me as of an unearthly perfection. A certain sense of humility, a feeling that I was presumptuous to entertain the thought of her as a wife, kept me for a moment silent. But such feelings do not last long with a lover, and quickly, shaking them off, I gave her the usual morning greeting.

'It wants some time to the breakfast hour,' said I; 'will you walk a little way?'

'Certainly,' she replied simply.

'I have been a long time looking for an opportunity of speaking to you on a subject of the greatest interest—to me—at least,' I began.

'I know,' she said as coolly as before.

I did not like this. I do not believe any man likes to be anticipated in an offer of his hand, and I was disconcerted.

'May I hope, then,' I went on, 'that if you know the request I am about to make, you will grant it?'

'You mean to ask me to marry you. I cannot marry any one.'

'Yet you have been married?'

'Yes; but I must remain a widow till my death.'

'May I know the reason of your decision?'

'It is no decision of mine—it has been decided for me. Besides, if you knew my history, you would not wish to marry me.'

'Is it—is it?—I hesitated—anything to do with this?' and I touched the frayed rope that encircled her neck.

'It is,' she answered.—'We will now go in to breakfast; and afterwards, I will tell you about it;' and we walked back into the house without exchanging a word.

The reader will have thought I made but a tame appearance in the foregoing scene; and I cannot describe the chilling and deadening effect of Eugenia's calm commonplace words, and still more of her emotionless manner. I was prepared to speak with all the passion I felt; but an application of ice-cold water could not have more

thoroughly benumbed me. I was, moreover, intensely mortified to observe that she ate a good breakfast, talked gaily, and included me in the conversation. I was disgusted and angry, and hastily determined to dismiss her from my mind as thoroughly heartless.

That day and the next passed away without the promised explanation. In fact, I was mortified and sulky, and avoided her as much as possible. On the third day, a singular incident occurred, which painfully renewed all my interest in Eugenia. I was walking down a corridor leading to my rooms, when a door opened, and I perceived Madame von Stornheim slowly coming up a small staircase I had never before noticed, with her handkerchief pressed to her face. Out of respect, I paused in my walk, and observed a man, plainly dressed in black, following her. Where had I before seen him? His face was familiar to me, and brought back some painful association. I stood motionless in horror and surprise. He was the public executioner! He had been pointed out to me in the street at 11—Madame von Stornheim passed on, her head bowed, her face still hidden, followed by her hateful companion, and apparently unconscious of my presence. The mysterious pair stopped at the door of what I knew to be Eugenia's room. They walked in; the door closed behind them. I heard a faint sound of hysterical weeping, and roused to a sense of the indecency of my position, I walked away.

Eugenia appeared at dinner, cheerful and unconcerned as ever. Madame von Stornheim was absent on a plea of headache. She came into the saloon in the evening, however, very pale, and in evident suffering. She exerted herself to appear as usual; but in the midst of an animated conversation, I saw her turn deadly white. She rose, tried to reach the door, but suddenly swayed, and fell heavily to the ground. Eugenia ran to her, and reached her before either of her daughters, and with the assistance of an attendant, carried her out of the room.

That night was passed by me in a conflict of mind I cannot describe. My love for Eugenia had received a violent shock; but my interest in her remained undiminished—was indeed heightened by the mysterious circumstances I have described. My feeling of irritation against her was for the time overcome, or rather lulled by my curiosity; and after several hours of feverish agitation, I fell asleep, having resolved to claim the promised explanation from Eugenia in the morning.

It was the custom at Stornheim to serve breakfast in a large room for those who chose to take that meal in company. In compliment to me, most of the family had, since my appearance, adopted the English plan. On this occasion, however, the members of the family took their breakfast in their own rooms. I therefore found myself alone. After a pretence at a meal, I sent a footman to the Gräfin von Oberthal, asking her to give me a few minutes' conversation. He returned immediately, with the answer that the Gräfin would see me at once. He led the way to Eugenia's sitting-room, and knocking at the door, opened it. I walked in, and found myself in the presence of my living enigma. She was standing, scissors in hand, her graceful head slightly on one side, before a large table. Yards upon yards of coarse flannel were

spread out before her; a pattern was pinned on the end nearest to her, and she seemed rapt in consideration of how to cut it to the best advantage.

One of the most pleasing characteristics of Eugenia was her active charity. She never visited the poor, but had a kind of levee of her poverty-stricken proteges once a week. Money, clothes, and advice were dispensed by her with singular good sense and judgment; and she employed an old servant as a kind of almoner to visit those who could not leave their homes. I had been for some time aware of these facts, and they added not a little to the confusion of my ideas respecting her.

After the usual salutations, she abandoned her cutting out, as too noisy an employment, and taking up a garment already shaped, began sewing it with rapid and skillful fingers. Her appearance that morning was very striking. She had on a morning robe of rose-coloured cashmere, trimmed with black lace; a rich ribbon of the same colour as the robe, and mixed with black lace, was twisted in her hair, and fell on one shoulder, settling off her magnificent locks. Behind her was an open window, showing branches of vine swaying in a gentle breeze. Vases of flowers were about the room, and on the open piano stood my favourite song, *Who is Sylvia?* All about her betokened peaceful, womanly existence. My horrible doubts and conjectures vanished, and I was just about to make a passionate speech, when that fatal noose, partly concealed in the ample folds of her robe, caught my sight, and again chilled me.

'Eugenia,' I began, 'that there is some terrible secret connected with you, I am compelled to believe. But I cannot think it is anything disgraceful—anything that should prevent your becoming the wife of an honest man. Eugenia, be my wife! If the mystery that clings to you brings sorrow and trouble with it, let me share it. I have a sufficient fortune. If you prefer a life of seclusion, I will give up my profession, and we will retire to some quiet part of the world—anywhere you like.'

'I am not allowed to leave Germany; I am not allowed even to leave Stornheim. I am not allowed to marry. I told you so.'

'But why? You are over age. You have not joined any religious order!'

'No. I am undergoing a punishment.'

'A punishment! For what? What can you, so amiable, so gentle, have done, to merit such a death in life as you describe?'

'What I have done, the world calls a crime. I do not. I am ready to tell you the circumstances. I do not even ask you to keep it a secret. It is indifferent to me.'

That which follows was not told me at once, but in two conversations. But I give it as nearly as I can, in the form of a connected narrative, omitting the questions which I put from time to time.

#### CHAPTER II.—EUGENIA'S HISTORY.

I am an only child. My mother was by birth an Italian, but was brought to Germany at an early age, and married very young. Ever since I can recollect, there was a singular coldness in her manner to my father. For what reason I do not know, for he was one of the best of men. He appeared to worship her; and never, until one day, relaxed

in his efforts to win her affections. On the day to which I have alluded—when I was about eight years old—my mother seemed in a somewhat better temper; she was talking cheerfully, and looked up at my father with an unusual smile. He, delighted, bent over her, and taking her hand, kissed it warmly. She rose up fiercely, struck him with her clenched hand, and hurried from the room. My father, a man of unusual height and strength, staggered back some paces, and then stood as if turned to stone, his teeth set, his face rigid and white. He remained thus, with his eyes fixed on the ground, for some minutes, until I, thinking he was ill, went up to him and tried to reach his hand. He started, caught me up, and in a broken voice, called me his own Eugenia, his darling, the one comfort God had given him, again and again. From that day, we were nearly inseparable. He took the sole care of my education; and in order to lose as little as possible of my company, instructed me in all the athletic exercises possible to my sex and age. He made me an expert fencer and shot. I always rode with him to the chase; and accompanied him in long walks. But he was watchful for the first sign of fatigue; and our walks generally ended by his carrying me home.

Our country existence was, however, suddenly ended by a summons from the reigning Prince, who gave my father an appointment which compelled his residence in the capital. My mother was clearly nothing loath to avail herself of the opportunity thus afforded her of appearing at all the court balls and receptions. Her great beauty attracted universal admiration, and she was pleased with the sensation she created, though she always preserved a cold and haughty manner. Her warmest admirer was an Oberst von Halden, a rival and political opponent of my father's. He was, moreover, jealous of my father's influence with the Prince, and tried to undermine him in every way. His admiration for my mother at last took the form of persecution. She could not move out of doors without his following her; and at every reception at our house he was present. My mother did not conceal her irritation and dislike of his attentions; and gave strict orders that he should not be admitted. He bribed our servants, no doubt, for he continued his visits. On one occasion I was surprised by hearing high voices in my mother's boudoir. I looked in, and saw her standing with one hand grasping the bell-rope, and the other signing him to leave the room. He looked confused and angry, and obeyed her imperious gesture, saying: 'You shall pay for your insolence, Madame, and that shortly.'

I afterwards learned that he set himself in the most deliberate manner to annoy and provoke my father, whose perfect command of temper for some time baffled him. At last, a gross insult, in the presence of a large party, left my father no alternative but a duel, the result of which was that my beloved parent fell, shot through the heart!

An unaccountable change in my mother's sentiments now occurred. Had she been the most affectionate of wives, instead of torturing her husband for years, she could not have shown more grief at his death. She raved, and conducted herself in such a manner, that it was thought unsafe to leave her alone; and a watch was set over her night and day for some time. At last she fell

into a settled melancholy, always repeating the words: 'Had I, but had a son to avenge him!' One day I said to her: 'Mamma, I am but a girl; but I promise you I will avenge my father's death.' She changed towards me from that moment, and seemed to cling to me as my dear father had previously. She made me repeat my promise daily, and dwelt with delight on my words. She languished and died at the end of a year. Her last words to me were: 'Do not forget.'

### A WORD OR TWO ABOUT ROSE-BEES.

BY A YOUTHFUL OBSERVER.

HAVING seen in Professor Ruskin's *Fors Clavigera* for April 1875 some interesting remarks about Rose-bees, I decided to avail myself of any opportunity that offered itself for discovering the haunts of these interesting little creatures, that I might note their habits. Being at Silloth—a small watering-place on the south coast of the Solway—in the midsummer of the same year, and being unable to walk about, I was wont to sit on some sand-hills which overlook the sea, to inhale the invigorating breezes, and watch the cloud-shadows as they chased each other over the broad breast of the neighbouring Criffel. As I sat one day on these sand-hills, thus occupied, a peaceful calm filling the air, and all things silent but for the rippling of the waves and the merry ring of children's voices, my attention was arrested by the hum of a bee; and looking round, I was delighted to see one, near me busily engaged in burrowing in the sand. Having always been interested in all kinds of natural history objects, and, by previous reading having obtained the knowledge that rose-bees build their nests in the sand, soil, and other places of like nature, I concluded that the wished-for opportunity had come; and upon closer observation, I found that there were several nests near the spot, in nearly every stage of construction, from the excavation of the hole to the filling up thereof with rose-leaves and pollen, and quite a colony of rose-bees at work. From that time the nests and bees were watched every day for fresh facts, and the following is the result of my observations.

If we follow the bee from the time of its nest-building in June, we find that the spot selected is free from the roots of grass and heather, which might interfere with its work. It settles down on an apparently suitable place—usually on a sloping part of a sand-hill, and on the side most sheltered from the weather—and begins to clear away the sand. It then scratches away the upper layer of sand, which is of course dry with the heat of the sun, and constructs a small hole about a quarter of an inch in diameter, burrowing exactly like a rabbit. Running into its tunnel, it gathers a small heap of sand, which it gradually moves outwards—itsself moving backwards—and finally pushes it back with its feet, till the sand forms a small conical hillock in front of the hole.

As soon as it has formed a tunnel about eight inches deep, it flies off in search of leaves. It does not confine itself to rose-leaves exclusively, but occasionally uses those of the laburnum, convolvulus, and French bean; though the rose-leaf is its favourite material, possibly owing to the serrations on their edges helping to bind them

together. A rose-tree in this instance was discovered about fifty yards from the burrows, where a number of the busy creatures were at work clipping away to their hearts' content. The bee does not take the whole leaf, but, hovering about till it finds one suitable, settles down and begins to cut. The pieces it cuts are of two different shapes—oblong pieces, about half an inch long and from a quarter to three-eighths of an inch broad, for the body of the cell; and small round pieces for the bottom and top. Having settled on the leaf, it begins to cut at the edge, and, with its right legs on one side and its left on the other, clips it in a curve of a parabolic or circular shape, according to its requirements. When cutting, it sometimes, though very seldom, crosses the midrib. To still maintain its balance when about to sever the leaf—as it is practically sawing off the end on which it is resting—its wings vibrate, and finally it flies off to its nest with the severed portion of the leaf curved up under its body, stopping often on its way to gather energy for a second flight.

Having arrived at its hole with its leaf, the bee draws it in, carefully arranging it, and with others—twelve in all, as I eventually found—forms the body of the cell. When it has got thus far in the construction of a cell, it flies in search of pollen and honey, which, converted into a paste, becomes the food of its future progeny. On this it lays an egg, and above all places the lid or lids—for it covers the egg with three separate circular pieces of rose-leaf; and in this fashion it builds seven or eight cells, the last so constructed that the lid fits exactly to the top of the cell. I took away some of these cells, and placed them in a greenhouse, to see if a new colony could be raised; but on looking a short time afterwards, I found, to my sorrow, that some snails had eaten them up, leaves, pollen and all.

One mysterious insect I have noticed hovering about the nests of these bees. It is like a rose-bee, but darker coloured, and about the same size. What is its duty? Is it a parasite? or is it an insect-pirate that comes to rob the bee of its honey or pollen? This seems the most reasonable conclusion; for it attacks the bee near the nest, flying back and forward over the holes until one arrives laden, when it pounces upon it, and a fierce struggle ensues. If the bee be laden with a piece of leaf only, the pirate speedily releases it, and lets it go into its hole; but if it be *not* laden with a rose-leaf, this assailant seizes the poor bee, throwing it upon its back, the struggle often lasting several minutes. The first impression of the observer is that it may be an ichneumon peculiar to these bees; but on scrutiny, this is found to be untenable; and as it cannot be its mate, the reasonable conclusion is that it is a robber, which steals its food from these bees when they are bringing the honey or pollen to their cells; and the fact that it always after actual seizure releases the bee without a struggle, when it finds it only laden with a rose-leaf, goes to confirm this conclusion.

Perhaps it would interest your readers to know how many pieces are required to form one cell. A cell was dissected, and found to consist of twelve parabolic pieces for the sides, one circular piece for the bottom, and three like it for the lid. Thus a bee has one hundred and twenty-eight

journeys to make for rose-leaves only, to build a nest of eight cells. How many more it must make for pollen and honey, can only be conjectured. The twelve parabolic pieces overlap each other again and again. Three form the cylindrical tube, or complete the circle; and the bee keeps on overlapping these first three with more pieces again and again, until it has got four times three in all, or has an average thickness equal to that of four times the thickness of a rose-leaf, presumably to make the cells sufficiently strong and impervious to moisture and the surrounding sand.

The rose-bees do not live in communities, but each makes its own separate burrow, often only a few inches apart from that of its neighbour; and though twenty or thirty bees may be seen upon one rose-tree, there is no hindrance to each and all getting what they require for the nests of their young. No strife disturbs, no envy troubles them. The only objects of their care and anxiety are their successors. Ever busy and anxious for the welfare of their offspring, they pursue their unwearying task till it is completed.

### A TALK WITH A DETECTIVE.

A TALK with a detective is generally interesting, and often instructive. We have a very acute officer in the city, and from him I learned a little regarding the difficulty experienced in tracking criminals. Some years ago, an extensive forgery was reported to the police; and on the evening of the same day a serious burglary was carried out in a jeweller's premises in the city. There was not the slightest trace of the daring criminals. The detective department was in despair; and the usual outcry as to the inefficiency of the police began to make itself heard. The detective told off for the burglary chanced to obtain a slight trace of some of the missing property, suspicion having attached itself to the inmates of a certain house, owing to their lavish expenditure of money. Further inquiries only strengthened the suspicion; but although there was the strongest proof that the police were on the right trail, none of the jewellery or silver plate could be discovered. This was exasperating, more especially as the detective had been assured that the property was actually taken into that house. The officer went to the station very despondent, and sought to beguile his thoughts by reading a volume of Edgar Allan Poe's stories. He had got the length of 'The Missing Letter,' when he started up, blaming his own folly, and proceeded again to the suspected house. Acting on the suggestion of the tale, he determined, this time, not to look under carpets and into mysterious cavities, or to tear up hollow-sounding portions of the floor. Knowing now that the safest place to hide anything was where people would never think of looking—as in the case of the letter staring the searchers in the face from the mantel-piece—the detective, accompanied by another officer, went into the house; and there, outside one of the windows looking to the back-green, and attached by a strong cord to the lintel, they found a bag containing all the silver plate.

But there was no trace of the jewels, some of which were of great value. The officers had another look round, a little encouraged by their partial success. The main room was elegantly

furnished, the oriel window being gay with a rich parterre of flowers in handsome Satsuma ware vases. My informant went forward to the window, took hold of one of the plants, when it came away in his hand, revealing the fact, that the earth in the pot did not reach the bottom of the vase. In a few minutes, the whole property was recovered from the several vases. An arrest and conviction followed, with a sentence of ten years' penal servitude to each of the ingenious thieves.

While the prisoners were awaiting their trial, one of them dropped a hint which rather enlightened a turnkey on the subject of the forgery, which, as above mentioned, had also happened on the same day as the theft. The detective was at once made aware of the information, which at first appeared insignificant. But this 'trifle light as air' proved important enough. The slight clue was followed up with relentless perseverance, with the result of bringing to light the fact that the forger had spent large sums of money in the very house where the burglars had been arrested. It was easy to get information from the inmates who had not been taken into custody. The detective at last became aware that the man he was in search of was betrothed to a young lady, the daughter of a very prominent citizen. Curiously enough, the crime had not got into the newspapers; while, on the other hand, the authorities had been heavily handicapped through the absence of any photograph of the criminal. The detective called upon the young lady, when he had assured himself of the absence of her parents, and asked her quietly to show him her album. With great self-possession, the girl brought the book, and looked steadily at her visitor's face; nor did she exhibit the slightest feeling when the detective, with a half-smile, congratulated her on being a clever woman, although he thought she might have been even more so, if she had filled up the page from which she had taken the photograph which had faced her own. He left the house with the conviction that while the girl knew of the whereabouts of her lover, she was a match for the cleverest of criminal officers. Let me tell the story in the detective's own words.

'As I went about, considerably annoyed at the way we had been checkmated, I saw the girl come out of a shop. Strolling in, I purchased a small article, and learned from the garrulous shopkeeper that he had just sold a large trunk. Here was a new phase. The young lady, it was generally admitted, had a great regard for the young man, and would very probably do all in her power to save him. Did she intend to leave the city? That was the point to be determined. I also learned, through proceedings which I am not called upon to explain, that the young lady had a private account at a bank in the city—not the one where the forgery had been committed—and took steps to ascertain her money transactions; when, to my infinite surprise, I was told that on the previous day she had withdrawn a sum of fifteen hundred pounds, explaining that she wished to place it in an investment of a private nature. But imagine my astonishment when I learned that on a certain day, about the time the forgery was committed, she had lodged nine hundred pounds—a hundred less than the sum obtained by the forger. I now resolved to set my knowledge and authority

against a woman's wits, not at all hopeful of the result.

'I met her in the street, where she affected not to recognise me. I followed; and when we came to a quieter thoroughfare, she turned, and at once addressed me by name. After some expressions of regret at the nature of my duties, I let her understand all I knew of the case, at the close giving a threat to the effect that I might be called upon to arrest her as an abettor in forgery. Even this did not affect her. Another thought struck me when I saw something white peeping from her hand-basket, and I bluntly asked her for the letter she had just received at the General Post-office. Without a pause, she handed me a letter bearing the post-mark of New York. We had suspected that the forger was in America; but inquiries at the post-office had satisfied me that no letters had been received addressed to the young lady, and I also knew that fear of her parents would prevent any communication between the parties. So, when I received this letter, my labours seemed about ended; for this being the first epistle, and the contemplated flight being taken into account, there was every reason to believe that the letter now in my possession simply meant the speedy capture of the forger. The girl bowed and passed on; but there was something approaching a smile on her face as she parted from me. The letter was bulky, and the envelope had a somewhat frayed appearance, as if it had fallen amongst water. "With breathless speed, like a soul in chase," I tore the envelope open, only to find every sheet of paper perfectly blank! I looked them over and over again, went to the office, and tried sympathetic inks, obtained a microscope—in short, made every effort to satisfy myself that I had not been duped. At last, I confessed that the girl had been too much for me.

'Fortunately for my peace of mind, I had not acquainted any of my colleagues with the slightest idea of my partial success, so that they had no occasion to rejoice at my discomfiture—a discomfiture bitter enough; for when I made inquiries the next day, I found that my bird had flown. I instantly hurried to Greenock—this was before the days of the Atlantic cable—only to see the large steamer sailing away to the West. A few months afterwards, I received a letter in a woman's hand, bearing the post-mark of a little township in the Rocky Mountains. This was all it contained: "You're a smart fellow, but no match for a loving woman. An old envelope full of blank paper is quite good enough for such as you. Had you been more civil, I might have taught you the art of re-gumming old love-letters!—Farewell. I am quite happy."

#### SAFETY APPLIANCES FOR SWIMMERS.

As the season approaches when thousands of inland people resort to the coast to spend a portion of the summer months, we generally hear a good deal said about the various appliances for protecting or saving the lives of those bathers who *can't swim*, but we seldom hear any proposals made in behalf of the bathers who *do swim*. Yet these latter form a class which are not by any means exempted from danger; and never a season passes without numerous instances of bathers swimming too far out and being unable to return,

or being seized with weakness or cramp, and going to the bottom like a stone before aid can reach them. Were swimmers in such emergencies supplied with some simple means of floatage till help should reach them, many a life might be saved that is otherwise lost. In order to meet this want, Mr R. H. Wallace-Dunlop, C.B., has patented what he calls 'swimming-plates,' which are manufactured by Mr R. J. Hammond, 78 Edgware Road, London. According to the illustrated pamphlet supplied to us, these swimming-plates consist of flat oval plates attached to the hands and feet, and their use is said to be easily learned. These plates are intended to give floating power, diving power, endurance, and speed to swimmers, and have, we believe, been much patronised in America. They enable an average swimmer to carry a considerable weight in water, and to swim at a greater speed; while the increased buoyancy which they afford enables weak swimmers to go long distances, or to lie motionless on the surface, without the constrained breathing of ordinary floating.

There exists, no doubt, among expert swimmers a prejudice against all kinds of artificial aids; but such a prejudice is essentially narrow and ill-founded. To insist that we should not add by scientific means to our natural powers of floatage or locomotion in swimming, is no more reasonable than if we were to hold that boots and shoes were not supplied us by nature, and should therefore be discarded in walking. Man is not naturally a *swimming* animal; the power is one that must be acquired. In dealing, therefore, with an accomplishment which is in its essentials artificial, it cannot surely be out of place to make use of artificial helps. But the chief argument for the use of such appliances is the increased safety which they afford; and whatever is qualified to diminish the painful catalogue of deaths by drowning which every summer brings us, is deserving of candid and unprejudiced consideration.

#### ON SEEING A YOUNG LADY KISS A ROSE.

MAY loving friends surround and cheer;  
May heaven bless and keep her safe  
From harm in every coming year.

I saw her tears fall softly down;  
I saw her stoop the Rose to kiss;  
Her hair was bright and soft and brown.

And was this Rose a lover's gift?  
And did it speak of faith and troth?  
Ah! shall I now the curtain lift?

O'ershadowed by that radiance mild,  
Behold, a little breathing frame,  
A fragile, pain-worn, workhouse child.

Her name is 'Rose'; and she is white,  
White as a faded lily-flower;  
But soon shall be an angel bright.

Over the low couch bent, I wist,  
Holding the little hand in hers—  
*This was the Rose the lady kissed.*

## SPARROWDOM

WE all can sympathise with emigrants to distant colonies who would wish to see about them a number of animals with which they have been familiar at home. To this sentiment we trace the efforts of the Acclimatisation Societies, to whom thanks are on the whole due for their endeavours to meet a popular wish. Rivers in Australia, Tasmania, and New Zealand have thus been less or more stocked with Scotch salmon and trout: and some charming bird-songsters from northern climes are now enjoying themselves in the Antipodes. The inanimate world has even been drawn upon for a contribution to old-cherished feelings; the common wild daisy, the gowan of Scottish poetry, is now seen blooming in gardens many thousand miles from home.

As if everything that is good and praiseworthy were destined inadvertently to become a source of disquiet and regret, it has happened that some of the best meant efforts of the Acclimatisation Societies have become a subject of challenge. On a former occasion, we drew attention to the well-founded complaints of a settler in New Zealand regarding the pest of rabbits, an animal incautiously introduced into the colony, and which had increased in numbers to an enormous extent. Similar complaints still occasionally reach us through the newspapers concerning these four-footed depredators; though, as far as we can learn, by the use of precautions, and a stern persecution, the number of these creatures is materially checked. In a New Zealand Journal, the *Otago Times* for February 25 of the present year, we see a number of notices of the mischief produced by the incautious introduction of certain animals from England. Speaking of the wool produced in a particular district, it is stated that for the last season 'the clip has been exceptionally good, a fact due in a great measure to the use of the poisoned oats. It is predicted that during the next winter the rabbits will be practically exterminated, when this part of New Zealand will again assert its superiority as a grazing country.'

The meaning of this we assume to be, that the farmers, as a measure of protection, have been under the necessity of scattering about quantities of poisoned oats, with a view to destroy the rabbits which pollute or consume their grass. It is a stern and heart-rending necessity; for besides the loss of the oats, certain valuable birds may be destroyed. In another part of the same paper we read that 'a settler is fencing round his pre-emptive with wire-netting to keep out the rabbits. When such an expense as that is incurred, it may well be imagined that bunny is pretty plentiful in the locality.'

Much is said in the paper in question regarding the small-bird nuisance; and an Acclimatisation Society receives complaints 'of destruction to grain and turnip seed caused by greenfinches and sparrows; also, asking the Society to supply poison to destroy those birds, and to state what it purposed doing in the way of the removal of these birds from the country.'

'In the discussion which followed it was stated that this Society was not responsible for the sparrow plague; and that as to the greenfinches, their damage to grain or other crops was far exceeded by the destruction they effected amongst caterpillars, slugs, and insects generally during the greater portion of the year when there were no growing crops to eat. It was also mentioned that in the case of two greenfinches killed and examined in Canterbury, their crops were found to be full of seeds of the logweed, showing that therein at least they were useful; and it was further stated that prior to the introduction of small English birds, it was impossible to grow barley, owing to the ravages of caterpillars.'

'In acknowledging the correspondence, the Secretary was instructed to inform the writers that "This Society regrets exceedingly any losses in grain or other crops which settlers may suffer through the ravages of greenfinches and house-sparrows, and that the Governor has removed the protection of the law from these birds, so that farmers are now at liberty to destroy them."

In another paragraph the following information

is afforded. A gentleman addressing a meeting of the Otago Institute 'admitted that the Acclimatisation Society had made serious mistakes in the introduction of some birds. From personal knowledge, he could say that at the beginning of this year a field of oats had been literally stripped by birds, and the settler had in pure self-defence to lay poison for them. He thought no one could blame the settler for what he had done; but he regretted to say that the consequence was that with the others, a considerable number of valuable birds, such as partridges and pheasants, had been destroyed. The way in which birds spread over the country was very remarkable. Sparrows which had been introduced in Christchurch, were now as far down as Look-out Point, where they could be seen in large numbers.'

As to the history and acclimatisation of sparrows some amusing particulars might be stated. The sparrow is mentioned in the earliest writings, not however, as a valuable bird, but as one familiarly known to everybody. 'Are not two sparrows sold for a farthing?' The remarkable thing about the animal is its audacity and determination of character. Wherever it goes, it insists within its sphere of trying to take the upper hand. Like the house-fly, it will thrive almost in any climate, is not dainty in feeding, nor does it find any difficulty in making good its quarters wherever it pleases to settle. Its impertinence improves by cultivation. The London sparrow, for example, is usually more resolute and provoking than the sparrows of a country district. Every part of Great Britain may be said to have its own sparrow population, which keeps its ground against all intruders. By people generally, sparrows are not much noticed; they are allowed pretty much to do as they like. You see them twittering on the house-tops, or squabbling among themselves for stray crumbs, that happen to be scattered about the roads or streets. The striking peculiarity in their conduct is, the exclusion of other small birds from any windfall in the way of food. Wherever he struts, the sparrow looks upon himself as master. Other birds are only endured, or tolerated flying about in swarms. Varieties of small birds contrive to keep aloof from sparrowdom, and in the midst of the multiplicity of fields, woods, and picturesque recesses, have not serious cause to accuse the sparrow of hostility.

Appreciated for his industry in clearing trees of small caterpillars and insects, it is not surprising that Acclimatisation Societies should have desired to make the sparrow one of their choice importations. It was a sentimental and natural desire, but a little heedless. Importers were probably not aware that they were creating a source of ornithological dissension, and that there might be some awkward consequences. Introducing sparrows was equivalent to naturalising a class of animals that would tyrannise over every feathered creature of like, if not greater dimensions. Such, we have been told, was the case at New York. The sparrows being installed in the public parks, speedily, as they increased in num-

bers, drove all before them. Not that the sparrow has the formidable appearance or character of a rapacious bird; he has not the characteristics of the *raptorial*; he has neither a hooked beak nor talons; on the contrary, he has a sleek, plump, aldermanic look; yet observed closely, he has formidable means of annoyance. He stands well upon his short legs; his plumage will undergo any kind of tussling without particular derangement; he is alert in his movements; his courage is equal to any occasion he may encounter; and he possesses a formidable weapon in his short stumpy bill. Believing that he is entitled to rule the roost in the small-bird creation, he arrives in his new foreign quarters ready for anything. He has come to conquer a new country. Let loose to survey the field of conquest, he views, we may suppose, with contempt the numerous pretty birds decorated in flashy colours with red head and bill, green breast and yellow tail. Though singularly beautiful, the Tanager is nothing in his estimation. His doctrine is war to the knife; the field must be his own; and it usually becomes so. The truth is, the sparrow is a guzzling little fellow, and much of his warlike spirit is due to an impulse originating in the stomach. We can conceive that he has no craving for the mere glory of fighting, but of securing all the food he can lay hold of. Hence, whether encouraged as a scavenger or as a scourge of insects, he will allow of no rival; and, generally speaking, other small birds get out of his way and let him alone. With this knowledge of the animal, we are not the least surprised that the sparrows introduced at Christchurch, New Zealand, have spread abroad in the neighbourhood, and are now to be seen in large numbers.

Admitting the intrusive and domineering character of the sparrow, there is another side to the question, which in fairness ought not to be forgotten. The sparrow is, on the whole, a friend to man, and you might almost say a companion. Though pert, he is more useful than mischievous. In winter, when snow covers the fields and roadways, he is put to his shifts, and deserves our compassion. It is a small duty incumbent on every one to throw out any waste food which will keep him alive at such an inclement season. This is a duty at least that we have always a pleasure in fulfilling; and are rewarded by the pleasure of seeing innocent creatures made happy. In France, we have been shocked by the scandalous manner in which sparrows and other small birds are recklessly destroyed; and for which cruelty, that country is suffering, in many respects, from a pest of insects. Outrages of this kind on Nature never pass unrevenged. W. C.

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER XXV.—OLD FRIENDS.

MONTHS, several months, had come and gone since the cold winter evening when Bertram Oakley, a suppliant at the Yard gate of Mervyn & Co., had been repulsed by 'Salt-water Joe,' the dogged door-keeper, and had fallen, fainting, on the hard-frozen road beyond, to be observed there, fortunately, by Mr Mervyn's nephew and partner, Mr

Arthur Lynn. Times were changed now, for Bertram. Joe, the gruff nautical Cerberus at the gate, would almost as soon have thought of excluding 'the Commodore' himself, as this bright, sweet-tempered young fellow, whom nobody called 'Oakley' or 'Mr Oakley,' but who was everybody's 'Mr Bertram.' Never before had any recruit, whether, with hammer and adze, he took his place among the sturdy privates, or whether he plied a quill or handled a measuring-rule among the warrant or non-commissioned officers, so won the liking and esteem of all, as did this unfriended lad, out of far-off Somersetshire, who had once lain, half-dead, outside the walled-in inclosure.

Arthur Lynn had told his uncle, that Saturday night, of his encounter with Bertram at the gate; and when the young man, with new colour in his thin cheek, and new brightness in his eye, came on the Monday to present himself at the counting-house of Mervyn & Co., he found himself at once in presence of those who desired to be his friends as well as his patrons. There are philosophers who tell us that prosperity is harder to bear than adversity; that the traveller who hugs his mantle around him in ruin and storm, will let it drop from his shoulders when the sun shines. But Bertram's nature, in its straightforward honesty, was proof against the petty frailties that infest meaner minds. His frank gratitude towards his new employers showed itself in deeds, not in words; and tough old master-shipwrights, not easily stirred to encomiums, and experienced clerks, reported that Bertram Oakley was worth, not his salt merely, but that of half a score of ordinary neophytes. The young man had a salary now, which, if not high, was ample for his modest wants, lived in respectable lodgings near his work, and was regarded as the most rising subordinate of Mervyn & Co.

Do good looks help us in this world? It is a question which has often been asked, and variously replied to. Even where womankind are concerned, there is no certainty. The pretty, silly girl withers on the stem, like a faded rose, while the plain sensible sister has a home and husband of her own. A fair face often spoils a man's fortune, makes him a coxcomb and an idler, causes him to offend the opposite sex and his own through the fatuity of his self-love, and lands him at last a hopeless failure in the Great Arena. But to such a one as Bertram, good as gold, true as steel, a handsome face is a passport; and his utter freedom from vanity, and the noble simplicity of his character, helped to make him popular. There had been clerks before his time who were liked by clerks and overlookers; and others who were well thought of by the rough wrights who thundered with mallet and hammer on the sides of the growing ship; but never one who was so much a favourite with the patricians of the glazed counting-houses and the brawny plebs of the slips.

Bertram had leisure now, and set aside much of it, gladly, for reading. He loved books; and Mr Mervyn had given him access to those wired bookcases, the contents of which had attracted his longing eyes at a time when he had no more reasonable prospect of poring over the literary treasures there encaged, than gaping country-folks who are shown the sights of the Tower have of becoming the temporary possessors of the Crown jewels. And Bertram drew, not enjoyment only, but profit from what he read. It needs a special faculty to sift the dross from the gold, to winnow the good grain from the flimsy chaff; and this attribute the young man possessed, as surely as the bee can extract honey from the flowers on which he alights. But this comparative prosperity had not made Bertram unmindful of former friends; and he took the opportunity of a day on which his services were not required, to pay a visit to Dr Denham's daughters in Lower Minden Street. It was again the joyous season of the spring-tide, that bright, blithesome spring, which Bertram, as he plodded on weary feet among the parlours of the Docks, had scarcely hoped to see once more. How had times changed with him since the frosty day on which he had wandered, forlorn and houseless, through the stale, unlovely streets of the Far East! It all seemed like a bad dream, that had passed away at cock-crow, that series of futile offers and harsh refusals, the flicker of reviving hope, the death-like chill of persistent failure. All that was over now. Bertram, as he turned the corner of Lower Minden Street, looked down at the sleeve of his coat, and smiled as he remembered how often he had hesitated to set his face that way, dreading lest Mrs Conkling the landlady should imbibe an unreasonable prejudice against her inmates, on account of the shabby attire of their only male visitor. But now the case was different.

'I am very glad to see you, very glad, and the more so, that I am so seldom at home,' said Louisa Denham, as she shook the young man's hand, in her scrumpy parlour.

'You and I are both, no doubt, very busy, Miss Denham,' answered Bertram, as he looked around him. The little parlour seemed unchanged; save in one important respect, was the same as when he had last seen it. There were flowers in the narrow window, gloomy, but for the colour and gloss of their bright petals and green leaves; but there was no sweet young face, crowned with golden hair.

'Yes; I miss my sister—I miss dear Rose—very much,' said Louisa, divining his thoughts. 'We had never been separated before; but— Well, Mr Oakley, it is all for the best, I am sure; and it would have been very, very dull for dear Rose, had she stayed always in this dull little bit of a room, while I went round from pupil to pupil and from piano to piano; for, I am thankful to say, that my kind friends of Miss Midgham's procuring have found me plenty to do in the

teaching way.—Yet a few years,' the brave little woman added, with well-feigned cheerfulness, 'and, if Rose does not marry, Rose and I will be together again.'

Why, at the very natural suggestion that Rose Denham, in the very dawn and flush of graceful girlhood, might marry, 'some day,' Bertram should feel a thrill of surprise and almost of indignation run through every nerve and pulse, the young man himself would have been puzzled to explain. Perhaps he had been so used to picture Rose as always and permanently under the care of her helpful elder sister, that the notion of the fortunes of the two being sundered, even for a time, struck upon him as something extraordinary and unnatural. He muttered some commonplace answer; but again Miss Denham answered his thoughts rather than his words. 'You are surprised, Mr Oakley, that we two, loving each other as we do, and otherwise so utterly alone in the world as we are, should have parted. So should I have felt, but for the necessity of the case. Fifty pounds a year is not much, you know, for two of us; and with all our economy, one, or both, must work; and how could I do my duty to my pupils and their parents while my mind was haunted by the image of my darling child, pining, moping here, like a neglected bird! And then Rose fretted herself because she earned nothing; and her poor, pretty sketches, and her embroidery, could find no sale in shop or bazaar. She has pupils of her own now—young children, with whom she will not, at any rate, wither away in forgetfulness of her own youth. It is better as it is. But you will think me very selfish, Mr Oakley.—And now I must talk about you. What have you done?'

Bertram's simple story was soon told. More than once, as he told it, he saw Miss Denham's eyes glisten, and noted the keen attention with which she hearkened to his narrative.

'That is fine—that is grand! I shall always honour Mr Mervyn's name for that. And I am so glad, for your sake, Mr Bertram. I wish I had been a man!'

How often do we hear that wish, stereotyped on feminine lips in all climes and ages, and the meaning of which is so various! With some, it implies ambition; with others, a restless impatience of the restraints and proprieties which hedge in women more straitly than they do us; while in Louisa's case it merely meant a guileless wish that she were able to make money faster, so as to get her beloved sister beneath her own protecting wing again, but in a home brighter and better than Lower Minden Street could afford.

'Rose is at Southampton—near Southampton, rather,' Miss Denham explained; 'for Mr and Mrs Denshire, whose children she teaches, live at Shirley Common, a mile or two from the town. They are kind people, so that my darling has begun her career as governess—nursery governess, under good auspices. She writes me word that

she is well and happy, Mr Oakley; and she writes to me often, and sees me in her dreams, she says, poor child! She left me but seven weeks ago; so it is no wonder if I miss her still, and find myself lonely in the evening. In the daytime, luckily, I have not much time for thought.'

Louisa Denham had not much more to relate. Hers was a life useful indeed, but uneventful. Of her only near relative, with the exception of Rose, her sister, she had seen nothing and heard little. Twice, in the summer of the preceding year, she had observed the name of Walter Denham at the tag-end of the long list of guests at some princely entertainment; whether at Macbeth House or Mandeville House, matters little. And once a lady whose daughters she taught, and who knew her history, had mentioned 'Uncle Walter' as a popular member of society at Nice; but even then as about to start for Rome and Naples, after the unstable fashion of such rolling stones.

'No; he never writes,' said Miss Denham, in reply to Bertram's questioning. 'We have had no further communication with him since he and his legal advisers pounced upon whatever could be seized in our unlucky home in Harley Street. But Sowerby and French I did see—at least one of them—thinking, for Rose's sake, I was bound, at the risk of being fussy and litigious, to make sure that there was lawful warrant for what had been done. It was all too certain. Mr Sowerby was polite, and gave me every facility for ascertaining the truth; but the oddest thing was, Mr Oakley, that I left Lincoln's Inn thinking better of the lawyers, and worse of their client, than before. It seemed to me as if the solicitors were not much more than puppets in the hands of that bold, bad man; that they did not know whether he were really rich, or as poor as he pretends to be; and as if they were half afraid of him. I daresay you consider me a soured, suspicious old maid.'

'No, dear Miss Denham,' answered Bertram thoughtfully. 'Your opinion of the gentleman we speak of coincides, somehow, with my own.' He hesitated as to whether he should mention the disreputable betting-man whom he had found, stunned and bleeding in a ditch, now a year ago; and his allusions to the Bank at Dulchester and to some nameless enemy; but he decided in the negative. After all, it was improbable that he should ever see Nat Lee again; and what of real consequence could the vagabond have to tell?

'May I come now and then to see you?' Bertram asked at parting.

Miss Denham would always, she said, be glad when Bertram could spare her the time for a call in Lower Minden Street. She had no idea of housing herself elsewhere, at least for some time to come. 'Mrs Conkling is a good woman,' she said; 'and I like Rose to remember me here, in this wee place.'

Bertram went from Lower Minden Street direct

to the Old Sanctuary. The cobbler-landlord was pleased to see him; and so were the few birds that knew their former acquaintance, and had survived the killing frosts of the rigorous winter. And there was the sturdy vine, whose powers of hibernation Bertram had half envied, rejoicing in its dull way, in the new-born life of the awakened year, and putting forth a coy leaflet, which had hitherto escaped the mischievous fingers of contiguous children, and which, to Bertram's fancy, seemed a characteristic though silent greeting to himself. But the clear-starchers, mother and daughter, were not there. 'Gone away, afore Easter, somewheres Lambeth-way—they'd relations somewheres over the water, Lambeth-way,' said Mr Browse. Nor was the man of leather enthusiastic when Bertram, in a glow, related to him the episode of the lump of cake.

'Yes, yes; a tidyish lot—didn't owe me nothing,' was his grudging comment; for Mr Browse was a woman-hater as well as a bachelor. Then glancing askance at Bertram's new coat and the smooth nap of his hat, 'Quite the gentleman now,' he said gruffly. 'It's too quick, my lad, too quick to last. Light come, you know, light go. The luck can't be all one way.' By which expressions, Bertram's ex-landlord probably meant to re-echo the old pagan superstition which bade men eschew the company of the over-fortunate.

(To be continued.)

### 'SENTRY-GO' IN FRANCE.

STRICT observance of orders is at all times imperative on the part of the soldier, and all departures from the rules laid down are deserving of censure and punishment. Yet at times this may place the private soldier on sentry-duty in the most awkward predicaments. The accidental forgetting of the necessary password on the part of an officer wishing to pass, may entail upon the sentry the displeasure of his superior by a refusal; while a breach of orders would place him in jeopardy of his liberty, or even endanger his life. Perhaps in no European army are the duties of sentries so strictly enforced, and departures from the rules so severely punished, as in the French army. As an instance of this: just after the Franco-Prussian war, the Adjutant-major of a certain *corps d'infanterie*, in order to test a new sentry, who had been placed upon a responsible post, approached, and affecting to have forgotten the word, at length, by means of threats, prevailed on the ignorant soldier to allow him to pass without giving the word. This he immediately reported; the result being that the poor young fellow was sentenced to be shot; this decision fortunately being commuted to banishment to Algeria, by influence brought to bear from high quarters.

This Adjutant-major at length met with a well-merited rebuff, as the following narrative—the dialogue of which we give in English—shows. Finding a newly joined man placed on a similar duty, he determined to repeat his former experi-

ment. Fortunately, however, the sentry had already been warned by his comrades, and was resolved not to be outwitted. As the night wore on, he observed the officer approaching alone, lantern in hand, and at once challenged: 'Who goes there!'

'Officer of the guard!' at once came the response.

'Approach to the word, officer of the guard,' continued the sentry.

The officer approaching, said: 'I have forgotten the word, and you must let me finish my round without it.'

But forewarned, the only reply made by the sentry was: 'The word! Stand back, or I fire.'

'I have forgotten the word, I tell you,' persisted the officer.

'Can't pass without the word,' was the only answer made by the sentry, as he kept him at bayonet's point.

'You know me perfectly,' insisted the officer in a tone of chagrin. 'I am your officer—your Adjutant.'

'I don't know you. Keep back, or I fire,' was the only reply vouchsafed him.

'You dare not fire on your superior; and as it is, I will have you severely punished for thus detaining me from my duty.' So saying, the officer seized hold of the bayonet, and endeavoured to force his way past.

The sentry once again shouting, 'Stand back!' drew away his bayonet, and made as if to charge the officer.

Stepping back, the officer drew his sword, and came on again, but was instantly disarmed by the sentry. Seizing hold of the muzzle of the rifle, he next endeavoured to wrest it from the sentry's grasp. The sentry being new to the corps, and knowing perfectly who his opponent was, refrained from firing, not knowing what the consequences might be of firing on his superior, even though the pass had been refused. In the struggle, however, the rifle went off, and the bullet whizzed past the officer's ear, carrying with it a piece of his head-dress. Half-stunned, and utterly confused by this unexpected turn of affairs, the officer lost his presence of mind, and actually took to his heels; and without reflecting on the probable consequences of his act, he reported the fact of his being fired on by the sentry, who was immediately marched off to the guard-room a prisoner.

Next morning, a court-martial was convened; and the sentry, after having been charged with firing on his superior, was asked what defence he had to make. In a few simple words, he explained that he had been placed on duty at a certain spot, with strict orders not to allow any one to pass without giving the countersign; that an officer, whom he now recognised to be the Adjutant, had endeavoured to force past without giving the word, and on being prevented, had seized his rifle, which had gone off by accident.

The Adjutant-major, on being interrogated, could not but admit the truth of this statement; and the Colonel, a severe but just disciplinarian, amid the cheers of those present, gave judgment as follows: 'The Adjutant will remain in his quarters during the next eight days, having unnecessarily endeavoured to cause a private to perform a breach of duty. The name of Private D— will be entered on the *ordres du jour*, and remain there during the same period.'

This was equivalent to eight days' imprisonment for the officer, and to the highest praise given to privates; the entry in the *ordres du jour* being read to the assembled regiment at each morning parade as follows: 'Monsieur le Colonel compliments Private D— on the zealous performance of duty under the most trying circumstances.'

This public rebuke to the officer had a salutary effect. 'However, to his credit be it said, he never attempted in any way to molest the sentry for his share in the affair.

Numberless amusing instances might be related of the fix officers occasionally find themselves in by forgetting the password. Two sentries were mounting guard inside the walls of the prison at F—, one at each angle, with strict orders to detain any one attempting to pass without giving the sign. The Lieutenant on his round of inspection passed the first sentry, giving the word correctly enough. When half-way between the sentries, a sound on the outside of the wall attracted his attention, and whilst endeavouring to investigate the matter, the word quite slipped his memory. Finding his suspicions groundless, he approached the second sentry, and was again challenged; but in spite of his utmost endeavours, he could not remember the word. 'Can't pass without the word,' was all the reply given him. Returning to the first sentry, he was challenged as before, but as he could not give the word, was not allowed to pass him either. No entreaties could prevail. The sentries, not knowing but that he was testing them, and rather enjoying the joke, if the truth must be told, proved obdurate to all persuasion. Here then he was kept all night between the two, shivering and cold, till the gray dawn appeared, when he was relieved by the change of guard.

It is usual in France, when quartered in provincial towns, for the Colonel of a regiment to post a sentry before his door, with orders not to admit any person without a special password. This is mainly to prevent his being disturbed by the trivial complaints of the civic dignitaries. It so happened that the Colonel himself returned very late one night from a concert, and discovered, to his dismay, on being challenged, that he did not know the pass. He endeavoured to gain admittance to his own house, but in vain; the sentry was not to be moved; and although he recognised his Colonel well enough, he knew his duty better than to allow even him to pass without

the word. Away the Colonel had to go to the nearest guard-room and get the word there, before he might go to bed. He enjoyed a hearty laugh at his own discomfiture, and highly commended the sentry—who was secretly quaking—for his unwavering devotion to duty.

Just at the termination of the last French war, the sentries placed on guard over the various prisons had rather a lively time of it. In many towns containing a large criminal population, they were often shockingly maltreated, or even murdered. The reflections of sentries thus placed, especially if young or newly enlisted, must be anything but pleasant. Each time a spot is approached which may conceal a lurker, he knows not but that he may be struck down by some cowardly blow; and as the long, dark silent night creeps on with lagging steps, its depressing influence, combined with the feeling engendered by the uncomfortable pressure of his accoutrements, all tend to produce an unnatural state of nervous excitement. Even the most brave and reckless spirits of a regiment hate and dread this duty. Place them in any position of imminent peril where the danger is seen and known, and they care not a straw; but this unknown, unseen danger causes even the stoutest heart to shrink. A good story is told of a new sentry placed on this undesirable post. News had been received of an attempted escape on the part of some prisoners in a neighbouring jail, and the orders were doubly strict. He paced up and down on his beat, using his eyes and ears to the best advantage. Time wore on, and there was nothing seen or heard to excite suspicion, and he began to be less careful to note all that was passing. For a moment he paused, thoughtfully; but rousing himself, he lifted his eyes, and saw, away up on the prison wall, some white object moving, as it seemed to his excited imagination, towards the ground. He watched it attentively for a moment or two in the dim uncertain light, and observing that it continued to move, challenged at once: 'Qui vive?' No reply came to the summons, but still the movement continued. He challenged again and again, and receiving no answer, was convinced that a prisoner was attempting to escape. Levelling his rifle, he took steady aim, and fired; on which the object disappeared for a moment, but soon reappeared. The Guard immediately turned out, to find the cause of the alarm. Upon being interrogated, the sentry explained, that having observed a prisoner escaping, and receiving no answer to his challenge, he had fired at him.

The officer in charge also perceived the moving object, and proceeding at once to the prison, turned out the jailer, and entered the cell only to find it empty, and not in use at all. On further investigation, however, they found a prisoner's blouse hanging just below the window. It appeared that the owner, having got wet during the day, had hung it up to dry, from the cell below, on a projecting nail, taking advantage, as he fondly hoped, of the friendly cover of darkness. It augured ill for the safety of any prisoner who might have been in it, that when examined, a bullet-hole was found right through the centre.

This formed fine laughing matter to the jailers and the military, between whom there was but very little love lost; and the poor sentry got anything but commendation for his zealous performance of duty.

## SKETCHES OF SCOTTISH LIFE AND CHARACTER.

### DAFT BAUBIE.

FROM time immemorial there has existed in nearly every Scottish village or hamlet some poor creature partly or altogether insane—one who is looked upon as an institution of the place. In the village in which many years ago I resided, we seemed to have had something more than the average share of 'daft folk;' but the one who clings closest to my memory is Barbara —, or 'Daft Baubie,' as she was invariably called. Even so far back as I can recollect, Baubie was an old woman, but still erect, and capable of exertions that would have tried many men, and left most women, twenty years her juniors, hopelessly behind. She was somewhat above the medium height, rather spare than otherwise, with features that in her youth may have been pleasing, but which were now strongly marked, and bronzed by exposure to the sun. There were many stories current among the younger villagers to account for her insanity, one party holding that she went mad for love, the other that she was driven mad by religious fervour. The older portion of the community, however, was well aware that Baubie's disease was hereditary, and had come to her from generations of ancestors who had been afflicted in a greater or less degree than herself. At this distance of time, I am unable to say whether the paroxysms of her disease followed each other at any certain intervals; but I recollect that, in her same intervals—extending to weeks, or perhaps months at a time—she was invisible, being confined to her house, where she lived with two bachelor brothers, both of whom, like herself, were well stricken in years.

It was a thatched building of a single story, but from its great length and breadth, capable of accommodating, even comfortably, a much larger family than Baubie and her brothers. On opening the one door facing the street, you were at once confronted by the *hallan*—a wooden partition running to the right, and forming a lobby of some length, while it served at the same time to insure privacy, and to add to the comfort of the inmates assembled round the kitchen fire. I can only recollect being once fairly inside this house, with leisure to note its peculiarities, and this was some years after the time of which I now write; for it was a question of daring among us of the younger fry as to who should, on the occasions of Baubie's seclusion, penetrate farthest into the interior and remain there the greatest length of time. There was in these attempts a spice of danger; for with Baubie, even at her best, no time was lost in choosing her weapon, and whatever came to hand did duty as a missile, not always in a futile way, the moment she became aware of the presence of an intruder. Notwithstanding this, we were sufficiently well acquainted with the peculiarities of the lobby and *hallan*, the latter of which sustained a col-

lection of articles more varied and heterogeneous, I believe, than was ever elsewhere displayed on a surface of the same extent. Nails had been driven into the boards in every spot where a nail could possibly be inserted, and on these were hung the various articles of this curious museum.

Exactly opposite the door there had been originally cut in the *hallan* an opening of about a foot square, which had been covered by a sliding panel; this opening having been intended as a means of easy communication with persons whose business required only an answer at the door; but it no longer served the purpose for which it had been intended. Its panel was securely fastened, and served to support a huge wooden platter known in Scotland as a 'treen truncher,' or in other words, a wooden trencher. Above this was hung another vessel of the same kind, but smaller in size; while below it, of all things in the world, was suspended the wheel of a barrow which had been cut out of a solid piece of timber. On a row of nails driven into the *hallan* at its greatest height, and extending along its whole length, hung strings of egg-shells, which strings bore specimens of the eggs of every bird found in the district, from the peahen and goose to the wren and titmouse, besides those of some birds which had not been seen there for many generations—such as the eagle, the wild swan, and the ptarmigan. It may be doubted whether even Baubie's brothers could have named the collector, as it is certain they were altogether ignorant of the completeness, curiosity, and value of this great oological collection. Filling up the spaces between were many sea-shells, but these were, comparatively speaking, neither curious nor rare. In several places, and so fixed as partially to obstruct the passage, hung large bundles of carded wool, which had probably been long ago prepared for the spinning-wheel by the mother of those who now lived here. There were also parcels of herbs, wrapped, like the wool, in stout paper, and ready to drop into dust at a touch. There were heads of hoes and other gardening and field implements, besides scores of other things useful and useless. These, like everything else in the house, Baubie and her brothers included, were browned by 'peat-reek,' and tarnished by the tear and wear of time.

As I have already said, I do not know whether the paroxysms of Baubie's disease followed each other with anything like regularity; but it was customary to hear the remark, 'Baubie's in her tantrums again,' which indicated that the term of her seclusion was over; and forthwith she was to be met at all hours of the day, and often far into the night, either in the village street or somewhere in its immediate neighbourhood. Wherever or whenever met, her talk was incessant, and her anxiety to be somewhere else irrepressible. Her conversation, if conversation it could be called, commenced as soon as she came within hearing of the person addressed, and was continued for a minute or two with great volubility at the point of meeting; and then, as she passed onwards, urged by her restless desire to be on the move, the babblement only ended when the somewhat shrill tones of her voice could no longer, in the distance, be resolved into words. But still her talk went on to imaginary hearers, whose loves and hates and works and ways were either forgotten or had been long since buried in the dust. Now and again, her

shrill voice would be raised in song or psalm, paraphrase or hymn; and the rapidity with which the chorus of some humorous old Scottish song was tacked on to a verse of Sternhold and Hopkins, might have seemed blasphemous, as it was certainly grotesque, had not the mental condition of the poor creature excused her aberrations.

Although sometimes irritated to the point of being dangerous, by grown or half-grown persons, it was remarked that Baubie's good temper in the presence of children was unflinching. Indeed, it was pleasant to observe the abounding glee with which she would pour forth to a group of children the stores of her incoherent memory. Nursery rhymes, songs, and fairy tales, confusedly jumbled with psalms, hymns, and passages of Scripture, were repeated with a volubility and vehemence that bore down all obstacles, and doubtless gave as much pleasure to her round-eyed audience as they certainly did to herself.

Baubie's great season, however, in which she never failed to be out and about, was that portion of the summer that was devoted to the 'castin' o' the peats.' In this rural employment of digging and stacking peat, which although somewhat laborious, is usually carried on with as much merriment as haymaking itself, Baubie took great delight; and her appearance on the 'moss' was as regular as that of the season. To whomsoever she offered her services—and no one ever thought of refusing them when offered—she gave at least full value for the food and wages she received. During the time this labour lasted, no irritation, no sudden change of mood, prevented her from doing faithfully and well that portion selected by herself as her own share; while any interference on the part of her co-workers, even in the way of kindly and well-meaning help, was fiercely resented and promptly put down. Meanwhile, a stream of talk was kept up, diversified only by scraps of secular and sacred song, as incessant and voluble as if she had no other business on hand. As in the case of any one who at all times and at all seasons gives utterance to whatever comes uppermost, Baubie's constant and unlooked-for breaks into the conversation of others were at times, from their startling appositeness, the cause of much mirth as well as surprise. Oftener, indeed, the point of Baubie's interruption lay in a species of malicious innuendo that from any one else would not have been tolerated, but from her could only be borne with whatever show of grace the victim could summon to his aid. In this connection, it was very curious to note what a keen recollection Baubie had retained of the scandal of bygone days, and with what an amount of critical skill she could at times contrive to turn this knowledge to account. Any man who had been guilty of an indiscretion dating back even as far as thirty or forty years, was obliged, in pure self-defence, so long as the 'peat-castin' lasted, to be on his good behaviour with Baubie.

Time wore on, and in the summer of 18—, Baubie made her customary appearance at the 'castin' o' the peats' among the workers of the village. It was observed that, although still energetic, willing, and voluble, she had aged visibly; and that her locks, never very carefully confined, were this year scantier and whiter than they had been even one short year before. It was also observed that her irritability was greater

than formerly, and that on one or two evenings when returning homewards, she had complained of being tired, a thing that never had occurred before. No one, however, paid much attention to these signs of change, and things went on very much as usual, until within a day or two of the season's work being finished, when Baubie's self-control seemed to have fairly broken down, and her sudden and causeless outbursts of temper became violent and frequent. On the eve of the day when this labour for the year at the peats was ended, and following a time of great excitement, Baubie, after starting homewards with her fellow-labourers, declared her intention of going no farther until she had rested. As the village lay little more than two miles from where this resolution was come to, and there were still at least two hours of daylight, no one thought it prudent to offer counsel which might only excite her without having the desired effect. Baubie therefore seated herself on a tuft of rushes, and called to one of her companions to come and sit down beside her 'and she would sing him a sang he had not heard for thirty years.' But the company passed on, and left Baubie singing by herself, in a loud shrill voice, the following scrap of an old Scottish ballad, that sounded far across the moor:

As I was walking all alone,  
I heard twa corbies making a mane;  
The tane unto the tither did say:  
'Where sall we gang to dine to-day?'

'In behind yon auld fail dyke,  
I wot there lies a new-slain knight;  
And naeboddy kens that he lies there,  
But his hawk and his hounds and his la-lye fair.'

On the following morning, Baubie was absent from her accustomed place on the peat-moss; but as this was the last day, she was not much missed, and little notice was taken of her absence. 'Oh, she'll be in aye o' her tantrums,' was probably all that passed in relation to it. In the afternoon, however, one of her brothers made his appearance with the information that on the previous night Baubie had never come home. This was the first time that she had been for a whole night from under the shelter of their own roof. The news was at once passed along the whole line of peat-cutters, and a consultation was held among the seniors, by whom it was resolved at once to institute a search. No time was lost: orders were given, parties organised, and the search began at once. But the difficulties in the way were great; the moor was of great extent; nor was there evidence to show that the poor creature might not have taken any other direction, as well as that which would lead her back to the trackless and treacherous moss. When night closed in, and the searchers met at the place of rendezvous, no trace of Baubie had been discovered. Next day, the entire available population of the village—indeed, of almost the whole district—was engaged in the search with the same result, failure. On the third day, it was determined to confine the operations entirely to the moss, and to make the search of that as thorough as possible. During the course of that day, Baubie was found, alive and conscious, not very far from the spot where she had been last seen. She had not fallen a victim to the treacherous character of the peat-bog through which she

had wandered, but had evidently been stricken down by some sudden ailment.

She was very quiet now; the restless gleam of madness had left her eyes; her only words were: 'Tak' me to my mither.' The troubles of her stormy existence for nearly fifty years had altogether faded from her memory, and she was now only conscious of the younger, fairer, and happier portion of her life. She was carried home very tenderly. The news of her coming had preceded her arrival, and kindly hands had made every preparation, much needed in the miserable dwelling. When laid on her bed, she gazed round on the well-known neighbours who stood by, with looks that gave no sign of recognition. 'Mither?' she murmured, and listened as if for an answer. For some time she lay perfectly still. At length she raised herself to a sitting posture, heaved a deep sigh, and said: 'Oh, but she's lang, lang o' comin'. I maun gang and seek my mither!' She fell back very gently on her pillow, and departed on her quest!

## THE STRANGE STORY OF EUGENIA.

### CHAPTER III. EUGENIA'S HISTORY—continued.

LEFT an orphan in this cruel way at the age of sixteen, I became at once an object of the utmost interest in Blankenwald. The Prince and Princess immediately transferred to me the friendship they had shown my parents. A place near the person of the Princess, and apartments in the palace, were assigned me. I became the pet and plaything of the whole Court.

When I arrived at the age of eighteen, they busied themselves to find me a suitable husband, and proposed as the most eligible, Graf Albert von Oberthal, a distant cousin. I felt neither liking nor aversion to marriage; it even seemed in some measure to promise to help the accomplishment of the design I had always kept in view.

Von der Halden had never received an adequate punishment for his crime. Duelling, as you know, had been strictly forbidden in Blankenwald; but it had been found impossible to put it entirely down. It was punishable by the severest penalties short of death. But Von der Halden was ably and powerfully defended. An old story was raked up of a previous quarrel, in which my father had, it was said, been the aggressor; and the only result was the deprivation of all his official appointments, and a recommendation to retire to his estates in the country.

Three years had now passed since the duel, and Oberst von der Halden was recalled. Some political crisis had arisen in which it was thought his well-known abilities would render him useful. One evening, my royal mistress sent for me, and with much agitation told me Von der Halden was to be presented at court next day, on his return from retirement, and that she would excuse me from my usual duties, in respect for my feelings. I replied, that I had no objection whatever to meet Von der Halden, but that, on the contrary, I desired it. The Princess looked at me with sur-

prise, but said no more. During the presentation at court, I was standing beside my mistress's chair, and had a full view of Von der Halden, and he of me. I am considered very like my mother, though, compared with her, I am but as a copy by a feeble hand, to the original of a great master. To increase the resemblance, I put on one of my mother's dresses, the last she had worn at court. It was of black velvet, cut in the old Venetian style, with rich point bodice and sleeves. When Von der Halden saw me, he started, turned pale, and appeared to forget where he was. He seemed to regain his composure with difficulty.

We met subsequently several times; but master as he was of all the arts of dissimulation, Von der Halden could never conceal the dislike, and almost terror, I inspired him with. On one occasion, when he was compelled to offer me his arm, I felt it tremble as I placed my hand on it; and he replied, to some casual remark of mine, in unintelligible monosyllables. The indifference with which I met the destroyer of my parents, excited universal remark. Some attributed it to an excess of Christian charity; others, to a singular callousness of nature. My husband took the former view. He never could bear me to be in the presence of Von der Halden, and besought his 'dear injured saint,' as he called me, not to subject her health to so severe a trial.

All this time, I had never lost sight of my object, and waited patiently, feeling sure that 'the Lord would one day deliver mine enemy into mine hand.' I have said my father had made me a good shot. My skill with the pistol was remarkable, and I had always kept up the practice. Shooting at a mark was a favourite amusement with the young people of Blankenwald. My favourite weapons were a small but exquisitely mounted pair of pistols, without which I never travelled. One of them I kept in my pocket. I knew that chance must some day bring me face to face with Von der Halden, alone. The day came. In an avenue of the palace pleasure-grounds, I came upon him. At a few paces from him, I stopped, and took my pistol from my pocket. 'Von der Halden,' I said, repeating his words to my mother, 'you shall pay for your insolence, and that shortly.'

He stared stupidly at me, and stood motionless. I raised my arm, took steady aim, and fired. He gave a leap into the air, and fell dead, shot—as he had shot my father—like a dog. The noise of the report was heard at the palace, and I was soon surrounded by a frightened crowd. I showed my pistol, and related what had passed. The consternation was great, and no one seemed to know what to do. At length the head of the police was summoned. He took my statement down in writing; and I was conducted in a close carriage to the Schwarzer Schloss, a prison where state criminals were usually confined. Here, my position in society and the state of my health secured me unusual indulgence. Books, and working and writing materials, were allowed me. On two points, however, the authorities were inflexible: none of my friends or relations, with the exception of my husband, were admitted, and a female jailer was with me day and night.

When Albert was permitted to see me, the change in his appearance was dreadful; and his language shocked me extremely. He asked me, in a kind of agony, how I could stain my hands with the blood of a fellow-creature. 'Where was my love for him,' he demanded, 'or for my expected child, who would for ever be branded as the child of a murderess?' I in vain tried to make him see that mine was an act of retribution, and a solemn duty to my parents. He became so wild and unreasonable, that I was not sorry when the interview was at an end.

I was also much annoyed by the line of argument taken by the counsel engaged to defend me; and I think you will say justly. My trial took place shortly, and excited unprecedented interest. The royal family were present, and watched the proceedings with intense attention. The counsel for the prosecution described my act of justice as one of savage revenge, fostered by my mother, and carried out with a degree of cold cunning scarcely credible in a girl of nineteen. The late Von der Halden he represented as a victim in the first place of my mother's rage for admiration. She was, he said, of the most dangerous class of coquettes, a woman who encouraged admiration and then pretended indignant virtue. The duel, he acknowledged, was a deplorable fact; but the fate of the combatants might have been reversed. Moreover, he denied that Von der Halden had been the aggressor. The late Von Stornheim, he contended, stung and irritated by my mother's complaints of Von der Halden's attentions, had been the provoker. A romantic story had, he said, been got up that the late Von Stornheim had fired in the air before receiving Von der Halden's fatal fire. Yet of the four witnesses present, two had deposed to the fact that the pistol had exploded in his hand as he raised it; and the state in which the weapon was found confirmed their evidence. But leaving these details undiscussed, he contended that Von Stornheim had fallen in a combat conducted according to the accepted laws of honour—that it might be the fate of any man whose rank rendered him amenable to such laws. He begged my judges to dismiss from their minds the absurd interest that had been excited by the discussion of the romantic and melancholy history of my parents, and of my rank, sex, and personal gifts. My extreme youth, and the fact that I was shortly about to become a mother, were, he admitted, powerful pleas for mercy, and he would not urge that sentence of death should be passed upon me, though so diabolical, deliberate, and premeditated a murder had well merited it; but that I should be for ever deprived of the power of committing another. In other words, that I should be confined for life in a criminal prison.

The false and insulting statements contained in this speech did not nearly so much irritate me as those of my defender. He did his best, however, to clear the characters of my parents, the one from the charge of violence, the other from that of coquetry. Myself he described as an imaginative, impressionable girl, with all the fiery impulses of the Italian character overlaid with the phlegm and deliberation of the German. He asked his hearers to consider the effect on such a one of the loss of parents whom I devotedly loved, through the cruelty and profligacy of a relentless enemy. Un-

luckily, he said, these most natural feelings and affections were stimulated to the utmost by the injunction, even the commands of a dying mother. He dwelt at length on my personal gifts, and on the agonising position of the young and promising nobleman to whom I had been not a year married, and the dreadful stigma on the unhappy child to whom I was about to give birth, should I be degraded to a felon's fate. Much had been said by his learned brother about my disregard for law, and my presumption in venturing to punish an offence according to my own wild notions of justice. But, he would ask, what had the law done for me, that I should respect it? The circumstances of the duel, be they as they might, would be sure to be placed before me in the most partial light, and my father's death described as a cruel and cowardly murder. What would my reasoning be? That the man who had murdered my father, and grossly insulted my mother, was punished. As how? By the forfeiture of a few appointments, the income from which bore no proportion to his princely revenues, and by a retirement to the most beautiful part of Germany. After three years of this mild, he might fairly say nominal punishment, he reappears with all his honours restored, and prosperity doubled, before the eyes of the girl his guilt has orphaned. What wonder was it that the outraged daughter had taken the law into her own hands, and dispensed it according to her own ideas of justice. Wild the act was certainly, but the provocation was resistlessly strong.

Another plea he urged for me, and here was the sting! He contended that my mother's inconsistent and unwisely conduct, and her causeless rancour against an affectionate husband, betokened some mental derangement. There was no doubt, he said, that I had inherited her *malady*! He spoke with scorn of the suggestion that I should be condemned to perpetual imprisonment, with its concomitants of severe labour, and coarse food and clothing, as a merciful alternative. Better far put me at once to death, than condemn me to a life of lingering torture and degradation. No! He urged that my total acquittal on the ground of intense provocation, and a morbid sense of filial duty acting on a deranged mind, was not an act of mercy, but merely of justice, and the only course open to my judges.

A hum of approbation followed this speech. Applause is unusual in a German court of justice, and it betokened that the sympathy of the lookers-on was with me.

I have not spoken of witnesses. In fact, they were few, and for the most part unimportant. My full confession had rendered them unnecessary. The only important evidence was that of the medical men, who were examined at great length as to whether I was responsible for my actions or not. Opinions were divided; but the majority was in my favour, if favour it may be called to declare me *mad*, when my judgment was as clear, my sense of right and wrong as sound as ever. Be that as it may, my life was saved by the trifling majority, though my liberty was gone for ever. Three days were consumed in this wearisome procedure. The evidence was exhausted, and the President proceeded to sum up. This he did with great elaboration; but, briefly stated, his conclusion was, that I had not been guilty of murder in

its most revolting form, nor yet innocent of slaying, and that I *was* responsible for my actions.

The sentence passed upon me by the court I cannot give in the exact words, but the effect was: That I was to be closely confined in prison, but without hard labour, for one year; that on my release, I was to find two good sureties to undertake that I should present myself every 10th of October, the anniversary of Von der Halden's death, at the Schwarzer Schloss, where the hangman for the time being was to place round my neck a noosed cord, which I was never to remove, but to wear conspicuously at all times above my upper dress.

I was, after the passing of the sentence, at once removed to the Schwarzer Schloss, more strictly guarded than before, but with greater indulgences. I was also allowed to see Albert, when he had recovered from a nervous fever which had prevented his presence at my trial.

At the end of three months, my child, a son, was born, and for a time my health visibly declined. My child too was weakly, and it was thought we should both die. These facts becoming known, a strong movement took place in my favour. Von der Halden had been universally disliked; and I was popularly regarded as an instrument of Providence in his destruction. Petitions were signed in every town, and deputations were sent, begging the Prince to remit the rest of my sentence. With some difficulty and after some signs of a public tumult, he agreed to restore me to my husband's care under many stringent conditions.

On the day of my release, in spite of every precaution to insure privacy, crowds assembled at the prison doors. The road along which I had to pass was lined by cheering, shouting, excited masses of people. To Albert, this ovation was a deadly infliction. He shrunk into a corner of the carriage, pale, and trembling in every limb.

In the country, to which we retired, my child and I soon recovered. But I was rendered very unhappy by Albert's strange conduct. He appeared to have conceived an aversion for me, which extended to my child. He was compelled, by the terms on which I was released, to keep a kind of guard over me; but it appeared to afflict him with acute distress. If he could avoid it, he would never look at me, and his child he never noticed. One day, I surprised him praying that God would release him from a trial too great for human strength, and that He would mercifully take to Himself the unhappy child while it was yet innocent. A short time after, Albert was found dead in his study-chair. His death was pronounced to proceed from *angina pectoris*. But my own opinion is somewhat different. As if in answer to his prayer, my child soon sickened and died, and I was once more alone in the world.

My uncle, Von Stornheim, as my nearest existing relative, was compelled to assume guardianship over me, which he did with much reluctance; but he has long become reconciled to my presence. My yearly visit to the Schwarzer Schloss was found to be so inconvenient, and attracted so much notice, that it was instead agreed that the executioner should come here, with his detested presence, on the 10th of each October.

Here ended this strange woman's story. One characteristic remark she made in answer to a question I put to her.

'My killing Von der Halden was no crime, for I feel no remorse.'

#### CONCLUSION.

Before I heard Eugenia's account of her life, I should have regarded the end of my visit to Stornheim with regret. Now I was relieved to find that in three days at most my business with the Graf would be finished, and I might turn my back for ever on the scene of my first, and what I felt would be my only love passage. The interim I devoted to a steady attention to my correspondence, which I had allowed to get somewhat in arrear; and in order as much as possible to avoid awkward meetings with Eugenia, took out my dog and gun into neighbouring coverts, and tried to secure good nights by long and tiring excursions.

I was returning one evening through the grounds, when I met the Gräfin von Stornheim, who turned back with me. She was evidently desirous of beginning a conversation on a subject which she had some difficulty in introducing. Without appearing to notice her embarrassment, I spoke of the rapidly decreasing days, the approach of winter, and other topics which naturally present themselves when one is making conversation. She appeared not to hear me, and interrupted me. 'My dear young friend,' said she, 'I cannot suffer you to go from us without expressing my sympathy—my regret—my—the feeling—' Indeed, she continued, speaking with great emotion, 'I saw from the first your attraction towards my unhappy niece, and if a warning could have saved you, I was ready to give it. But one never knows in these cases—a hint would have been of no avail; and I was not at liberty to tell you all.' Madame von Stornheim turned her still beautiful face towards me. Her eyes were full of tears, and her distress was clearly genuine.

'Dear lady,' I replied, 'do not torment yourself. You are right. Having once seen Eugenia, no warning would have saved me. Let that pass. But tell me—your opinion will have great weight with me—is Eugenia mad, or is she?'—

'Wicked, you would say? Who shall solve the problem? In the middle ages, or in a time of disturbance, such a deed as hers would have been deemed heroic. There is in Eugenia the material for a Judith, a Joan of Arc, a Charlotte Corday. But in these times of order and peace, the heroine is a criminal. I have studied Eugenia closely for two years, and my impression is that hers is a stunted abnormal character. She seems insensible to pity, fear, or grief. Affections she has none—or rather,' said she, correcting herself, 'they are very limited. It was noticed that the deaths of three near and dear relations, her mother, her husband and child, affected her outwardly but little. And a singular thing has been remarked by all who know her—that she never sheds a tear. But Eugenia has some great qualities. Her conscientiousness and sense of duty are ruling principles. We have no security save her word that she will not attempt her escape from Stornheim. Yet, though her evasion would expose us to disgrace, perhaps to ruin, we have no anxiety whatever on that point.'

She is charitable, as you know; and in sickness, there is no such efficient nurse. Where more pity and sympathy would render others useless, the very absence of those qualities renders her invaluable.'

'Does she show no dislike, no feeling of degradation, when that horrible thing is placed round her neck?'

'Not the least,' replied Madame von Stornheim, shuddering. 'I am the only sufferer. It is provided by the law that one witness must be present. Since Graf von Stornheim's failing health has incapacitated him, I am compelled to be his substitute. The annual visit of that wretch invariably costs me a day's illness. Eugenia wonders at me, and asks what in the world it can matter.'

This was the last time Eugenia's name was mentioned between us; and the day after, I took my leave of Stornheim for ever. I parted from Eugenia without a sign of emotion on her part, but I fear on mine with a miserable attempt at composure.

At my request, Madame von Stornheim wrote to me from time to time. Eugenia, she said, showed no change; she was apparently happy and contented.

A gap of six months occurred in our correspondence. I had been uneasy, and written several times without reply. At last it came. It was to tell me of Eugenia's death. A fire had broken out at night at Stornheim; and sufficient warning had been given for all to quit the building in safety, it was thought, until a cry was raised that Eugenia and Carl—the little boy of whom I have already spoken—were missing. The fire had now made such way, that the stoutest men hesitated to go in quest of them, when Eugenia appeared at the nursery window, which she had opened, showing the child clinging to her. She placed the boy on the sill, and appeared to be trying to beat back the smoke, to give him air. Stornheim was a two-storied building, and the nursery was on the second story. A ladder was brought with all speed under the window; one of the men mounted, seized the child, and descending with him to the level of the uplifted arms below, delivered him in safety. He reascended; and attempted to help Eugenia down. She made the first few steps in safety; but whether the smoke and heat had affected her head, or whether she was giddy from the unaccustomed height, cannot now be known. She made a false step, fell, and was taken up—living, but frightfully and fatally injured. She lingered a few days in great suffering, borne without a murmur of complaint. Her beauty remained to the last, and to the last she insisted upon wearing her ghastly necklace. So profound and still was the sleep into which she had fallen, that they could not tell when she passed from it to death.

On her death, her uncle sent for a famous artist of Blankenwald to take a portrait of her, of which I obtained a copy. It represents her lying on her death-bed, her hands clasped on her breast, her long black hair lying in clusters on her shoulders. Her wonderfully chiselled features are thrown into strong relief by a taper placed at her side. The firm but delicate mouth is smiling.

It only remains to add that the evident desire to die with the visible memorial of her crime was looked upon by Eugenia's relations and myself with heartfelt relief. We looked upon it as a sign

that the Divine Mercy had before her death awakened in her a sense of guilt, and that a noble but perverted nature was thus reconciled to its Creator. In this hope, the last consolation of my declining years, I humbly rest.

## THE MONTH.

### SCIENCE AND ARTS.

ELECTRICITY is now applied to so many purposes, that we are becoming as familiar with it as with steam. The awe and wonder which its employment at first excited, have long ago given place to a settled conviction that it represents a power which man has at his disposal, and which can be made to do all sorts of hitherto impossible tasks. The electric battery, for most purposes where an electric current is required, is gradually giving place to the more economical dynamo-machine, in which magnets form the source whence the electricity is drawn. The old frictional machine is seldom seen outside the lecture-theatre, where it is still used to instruct the young in the principles of electric science. What is known as frictional electricity has not often been applied to any useful purpose, save that of education. Recently, however, a clever adaptation of it has been conceived by Mr Kingsland Smith—a transatlantic miller—in the construction of a purifier of flour, which separates the bran and middlings from the finer material. The flour, shaken mechanically, so as to bring the coarser particles to the surface, is passed beneath an india-rubber-covered cylinder, which revolves against a fixed rubber. The effect is the same as that which occurs on rubbing a piece of sealing-wax: the cylinder is electrified, and the particles of bran are attracted to it, until they are scraped off into a receptacle prepared for them. The finer flour then passes away quite freed from its impurities. The proprietor of the mill where this electric purifier has been in constant use for some time, estimates that the saving effected by it amounts to ten cents per barrel of flour. We may mention that the separation was formerly effected by air-blasts, necessitating extra engine-power, as well as cost in wear and tear.

A paper lately read before the Society of Arts by Mr C. Walford—On the increasing Number of Deaths from Explosions, with an Examination of the Causes—is likely to lead to very good results. The subject is treated in a most exhaustive manner, and the various explosions which have occurred from time to time are classified under different headings. Perhaps the most interesting of these is that relating to explosions of dust in different manufactures—notably in flour-mills. Colliery explosions of course come in for a large share of attention; and a table is given showing the number of such disasters occurring in each month of a particular year. This table is compiled with the hope that it may be compared with the barometric and thermometric readings during the periods given, with a view to indicate some means of future avoidance.

The electric light has found new employment at Sandy Hook, on the coast of North America. A buoy has been placed there furnished with a machine which, by means of the rise and fall of the waves, compresses air. This air, when it reaches a certain density, is made to move a

dynamo-electric machine, which causes a carbon loop in a vacuum tube to glow with light; at the same time a powerful whistle sounds. The buoy has been placed in position at the expense of the inventor, and pilots and navigators are requested to report upon its efficiency.

The inventor of celluloid—which our readers may perhaps remember is an imitation ivory composed of collodion and camphor—has compounded a new material for buttons, boot-heels, &c. It consists of leather-cuttings soaked in hot water, to remove oil, dried, ground to powder, and pressed into moulds by hydraulic power.

In an article which appears in an American paper on the Utilisation of the Waste of Cities, the various items are reviewed which go to make up the sweepings of the streets. It is noted that a large percentage of iron is present in the dust; due to the attrition caused by the tires of wheels and the shoes of horses. This iron can be picked out in appreciable quantities by means of the magnet.

Mr Major Thorp of French Creek, West Virginia, has patented a cattle-shed for use as temporary shelter in open pastures or fields. The roof of this shed is pivoted to an upright in connection with a kind of windmill; so that the shed is turned as the direction of the wind is changed, thus shielding the inmates from direct exposure to the storm.

It is now a matter of history that the failure of the first Atlantic Cable was due to defective insulation. In other words, the gutta-percha covering of the wire was porous enough to allow the water to leak in, and the electricity to leak out. The impossibility of separating the gutta-percha from its impurities, was the cause of this condition of things. An improved method of preparing the insulating material, which was patented by Mr Tuman, insured the success of the later Cable. This method, effective as it was, represented a complex process of boiling and masticating, which extended over several days. The same inventor has recently perfected a plan by which the gutta-percha is in a few hours far more thoroughly purified, and rendered more valuable as an insulator; and the Post-office authorities have adopted the system. The saving of cost is so much, that it may possibly go far to help in that consummation, devoutly to be wished, a reduction in the tariff for telegraphic cable messages.

Mr Preece, the well-known electrician of the Postal Telegraph Department, has lately pointed out a difficulty which will arise should electric wires take the place of the gas-pipes beneath our streets. The powerful currents circulating through them will cause such electrical disturbances in the neighbouring telegraph wires, that communication will be seriously interfered with. We may rest assured that means will be found to obviate this difficulty when it arises, which, according to present prospects, will be a long time hence.

'The harmless, necessary cat' has been convicted on good evidence of having carried an infectious disease from house to house, to the prejudice of the occupiers; at least, so say certain American physicians. The proofs of this delinquency are not given. A more likely source of contagion has been pointed out nearer home, in the case of certain jurymen who were obliged by law to view a body—a case of scarlet fever—while another

sufferer in the same house was lying ill of the disease which had in the one case proved fatal. The useless practice of forcing this duty of identification on jurors—generally men with families—when it could be so much better performed by the doctor in charge, points to a channel by which disease can be carried, which should at once be stopped.

It has long been a matter of notoriety that the British Museum had become so choked with specimens, that there was hardly room in the vaults for the cases which contained them, and which for the same reason could not be unpacked. Plans were proposed for extending the building; but as these were not deemed satisfactory, it was resolved to build a special Museum to hold the zoological, geological, botanical, and mineralogical collections. This building—designed on the most sumptuous scale—has just been opened at South Kensington; and the parent Museum is thus relieved of its surplus riches. The new building is adorned with architectural presentations of the objects which it contains; and even its terra-cotta walls bear figures in relief which, though they seem to have been stuck on in a haphazard fashion, have a capital effect. It is noticeable that many of these—in the case of fossil representations—have been moulded from the real objects.

H.M.S. *Colossus*, a very recently devised addition to our navy, is to be fitted with a propeller of manganese bronze, in place of one of gun-metal previously ordered. This change has been brought about by the results of some experiments lately conducted at the works of Messrs Maudsley, the contractors for the engines of the ship. In these experiments, one-inch bars of both metals were operated upon by being placed upon supports twelve inches apart, while pressure was applied to the middle of the bars. In the result, it was found that the manganese bronze would bear with impunity a blow of double the weight which broke the gun-metal. From these experiments, it was proved that the new propeller will save weight in machinery; while at the same time a thinner blade, offering comparatively little resistance to the water, can be employed. We may mention that the new metal differs only from ordinary bronze in the addition of a small percentage of manganese.

An attempt, but not the first, to introduce skylarks to the fields of America has recently been tried, and so far with success. That is to say, two hundred birds were imported from England last summer; and most of them have survived the winter, and are in good condition. Ere now, they have doubtless been set free to wing their way skyward.

It has been found that the ravages of the *Phylloxera*—which has caused such destruction among the vines in the Bordeaux and other districts of France—do not extend to vines planted on sandy soil. Bearing this fact in view, an extensive system of land-reclamation was commenced some two years ago in the sandy soil of Arcachon. The method of reclamation adopted is that practised by the Duke of Sutherland in Scotland, and has proved so successful, that three hundred acres of vines were planted last year. A far larger district, near Marseilles, is now to be put to a similar use; and we learn that one of the gentlemen interested in the scheme has,

through the courtesy of the Duke, inspected His Grace's property, and has received a Report by the land-reclamation agent who carried out the Sutherland improvements.

Important progress has lately been made in the matter of armour for ships of war. The iron plates used for this purpose have hitherto been of such enormous thickness, in order to withstand the impact from shots of high velocity and immense weight, that ships had to be constructed of an unwieldy size, in order to bear the weight put upon them. Some experiments carried out with steel-faced armour-plates justify the hope that the old plating of iron will now become a thing of the past, and will be replaced by the newer and far tougher material. Hitherto, the armour has invariably cracked and split in all directions under the impact of the projectile, even if it succeeded in stopping its progress. The new plates not only shatter the projectile itself, but exhibit no wound beyond the dent caused by the collision. The steel-faced plates are made by a process not yet divulged, by Messrs Cammell & Co. of Sheffield. The experiments on behalf of our own government have been followed by similar trials in France, with the result that the French ships of war now in process of completion will be protected by the new armour. The long-continued battle between big guns and armour-plates may therefore, for the present at any rate, be considered over, the victory being in favour of the latter.

The recent deplorable dispute in the Transvaal has had one good effect in pointing out a humiliating fact which there is no gainsaying. The British soldier, with the most perfect weapon of precision of modern times in his hands, has not yet learned how to use it. In other words, he is but an indifferent shot. The class from which our recruits are drawn seldom have an opportunity of handling a firearm until after they have received the Queen's shilling. With rifle-practice represented by a few dozen cartridges fired at a target under the best conditions of light and wind, he is expected to acquit himself as a first-rate shot amid the hurry, confusion, and carnage of the battle-field. We are happy to note that the whole system of musketry instruction is now under revision; and we may hope that, in the future, English soldiers will not have to look to their enemies for lessons in the use of the rifle.

For some months past, part of South Kensington Museum has been lighted by sixteen electric lamps of the 'Brush' type. These lamps replaced rows of gas burners which surrounded the two galleries in question. The actual saving effected amounts to twelve shillings and twopence per hour, which, after making the necessary deductions for interest on capital and depreciation of machinery, represents an annual saving of three hundred and sixteen pounds. It must be remembered that artificial illumination is only required here during seven hundred hours in the year; so that the economy is really greater than it would at first seem to be.

Some sensation is now being caused in Vienna by the exhibition of photographic prints which are luminous in the dark. The production of these curiosities is a very simple affair. An ordinary photograph is brushed over with castor-oil and turpentine, so as to render the paper semi-

transparent. It is then painted on the back with a phosphorescent compound, and mounted upon cardboard. After exposure to sunlight, it will retain its luminosity for many hours.—We may here mention that the agents for Balmieu's luminous paint—Messrs Ihlee and Horne, London—have recently introduced a new form of lamp. It is simply a square tin can covered with the paint, which after exposure to light, is filled with hot water. The heat has the curious effect of more than doubling the amount of light given out.

An ingenious form of measuring-bottle for the use of those unfortunates to whom physic is a necessity, has lately been invented by Mr J. M. Dodge of Chicago. The neck of the bottle is placed at one side, and is bulged in such a way that after inversion some of the contained liquid remains within it. The neck is graduated, so that any required amount can be separated from the bulk of the liquid. This reserved portion can afterwards be emptied into a glass without any of the other fluid escaping. We have also seen some very handsome American bottles (Walton's patent) for druggists' shelves, which seem to be an improvement on the kinds ordinarily used. For further particulars apply to the Apothecaries' Company, Glasgow.

Mr Andrew Jamieson, Principal of the Glasgow Mechanics' Institution, who has been experimenting with selenium in relation to its connection with the photophone, has recently brought a paper embodying his observations before the Society which he represents. The form of selenium cell adapted by Professor Bell is of rather a complex nature, and certainly difficult for any one but a philosophical instrument-maker to construct. Mr Jamieson points out how a most effective cell can be made by simple means; and the following is his manner of going to work. A glass plate or tube one and a half inches wide, and four inches long, is tightly wound at its centre part with two separate silk or cotton covered wires. The outer envelope of these wires is afterwards removed by the application of a red-hot iron, so as to expose the metal. There is thus left a series of bare copper filaments, insulated from one another by the double thickness of cotton or silk still remaining between them. The cell so formed is now heated, and a selenium bar applied, which soon melts over the metallic surface. Mr Jamieson has conferred a boon upon experimenters by showing them a very simple way of constructing a novel instrument.

Mr Brearey, the Honorary Secretary of the Aeronautical Society, has suggested a flying machine upon a somewhat novel principle. It is to consist of a kind of kite with a boat-like car, and is to be furnished with light apparatus, worked by steam or other motor, which will create wave-motion in the air, similar to that of skate and other flat-fish in their progress through the water. It has before been pointed out how prone enthusiasts are to take their ideas of what can be done in air from what is actually done in water, forgetful of the fact, that one fluid (air) is elastic, the other quite the reverse.

The ever-increasing importance of the by-products of the gas retort—from ammonia to the beautiful aniline dyes—forms a remarkable instance of the value of applied chemistry. A new

discovery in connection with these has recently been made by a Mr Sanders of St Petersburg. By a mixture of coal-tar, hemp-oil, linseed-oil, spermaceti, sulphur, and some other ingredients, he has been able to produce a material having all the properties of india-rubber without its disadvantages. It will bear extremes of heat and cold without injury, is very elastic and tenacious, and unaltered by long exposure to climatic influences. This last property would point to its application as an insulator for telegraphic purposes; and we shall doubtless soon hear of some trials of its capability for this work.

We learn from *Design and Work*, that smooth, strong, and pliable parchment can be manufactured from the palmetto of Florida and other Southern States. The parchment can be washed, rubbed and handled just like a cloth, and the writing will not be effaced. It can be cheaply manufactured, and is likely to come into general use for legal documents, &c. As much as sixty per cent. of the weight of the palmetto can be utilised in the process.

From another source we learn that it is now possible to *hear* plants growing. At a recent meeting of the Silesian Botanical Society, an apparatus was shown, in which the growing plant is connected with a disc, having in its centre an indicator which moves visibly and regularly, and thus on a scale, fifty times magnified, denotes the progress of growth. Both disc and indicator are metal, and when brought in contact with an electric hammer, the electric current being interrupted at each of the dividing interstices of the disc, the growth of the plant is as perceptible to the ear as to the eye.

We understand that Her Majesty's Secretary of State for Foreign Affairs has received from Her Majesty's Minister at Bern a despatch pointing out the necessity for all British subjects intending to reside in Switzerland to be provided with a passport or a certificate of their birth, which they must produce to the local authorities in order to obtain the ticket of residence without which no foreigner is allowed to remain in any canton.

The great defect of iron and steel for purposes where durability is required, is their liability to decay by corrosion. To prevent this, Mr George Bower, St Neots, recently read a paper before 'The Iron and Steel Institute,' in which he proposes a simple and, it is affirmed, an effective remedy, by forming upon the surface of these metals a film of magnetic oxide. The process, which is not expensive, is carried out in a firebrick chamber, in which the articles to be coated are placed, and connected with which is a set of 'gas producers'; a series of oxidising and deoxidising operations are then gone through, the thickness of the coating on the metal depending upon the number of such operations. From three to six hours are required for these, according as the articles are for indoor or outdoor use. Rusty iron can also be so treated—the rust indeed being thus converted into a thoroughly protective coating.

Referring to the paragraph on telescopes which appeared in our last 'Month,' we have ascertained that the instrument measuring thirty-three feet six inches was greatly exceeded by one erected about the year 1853 at Wandsworth Common by the late Rev. J. Craig, Vicar of Leamington. This monster refracting telescope was eighty-five feet of

focal length, with an object-glass thirty-four inches in diameter, and weighed nearly five tons. In shape it resembled a cigar, and was suspended outside a brick tower forty feet high. It was, however, never completed as the ingenious designer intended, but was afterwards pulled down and disposed of. Such was the fate of 'The great Craig Telescope.'

## OCCASIONAL NOTES.

### PROPOSAL FOR AN INTERNATIONAL POSTAGE-STAMP.

OUR postal system is perhaps, considering its vastness and complexity, one of the most remarkable organisations of the present century. Yet, comparatively perfect as it is, the operation of experience is every now and again suggesting some amendment, or discovering some little detail in respect to which an improvement might be admissible. For instance, it has been resolved recently to issue a special penny stamp which shall do away with the present distinction between receipt and postage stamps of that value. This will clearly be an advantage; and the astonishing thing to outsiders is that there should be a necessity for having, in any case, a distinction between stamps whose value is equal. One form of penny stamp ought surely to serve all the purposes for which a stamp of this value is required; and so on with stamps of other values.

We would in this connection suggest one respect in which a further improvement might be made in our stamp system, namely, by the issue of an *international stamp* which should be accepted as of equal value both in this country and in certain specified foreign countries. The advantages of such a reform are obvious. Under the present arrangement many inconveniences exist to those who have much correspondence with foreign parts. Premising that as a rule editors return all ineligible manuscripts, provided they be accompanied by stamps for their re-postage, we will take the case of a literary person in America who sends a contribution to a magazine or other periodical in this country. He must either be at the trouble of making and preserving a duplicate of his manuscript—which in some cases may mean the work of a few days or weeks, and consequent loss of valuable time, which authors can, as a rule, ill afford—or, the contribution proving ineligible, he must run the risk of never seeing his manuscript again. He need not inclose stamps for its return, as his stamps are of no value in this country; consequently, for this reason, many manuscripts are entirely lost sight of, besides being the cause of much trouble and annoyance to all concerned.

Now, it seems to us that this state of things might be easily rectified. Were a series of *international stamps*, of the usual graduated values, to be issued, guaranteed to carry letters or packages either from America, the continent, India, Australia, or elsewhere, to this country, or from this country to any or all of these other countries, the difficulty would be obviated, and an immense advantage conferred not only upon the literary and commercial world, but upon the respective communities generally. Under such a system, the author, instead of spending valuable time in making duplicates of his manuscript, would then

be able, as at home, to inclose the necessary stamps for its (possible) return, and all parties would be benefited—the revenue of the Post Office, perhaps, most of all. In this way also, applicants for foreign situations, or for information from abroad, would be able to secure a reply by inclosing the necessary return-postage; from the impossibility of doing which at present, much inconvenience and anxiety are not unfrequently caused. Many other cases might be adduced to show the advantages of such a stamp as that here proposed; but enough has, we hope, been said to make it clear that at present a great inconvenience exists, and that its removal might be easily effected by the issue on the part of the respective postal authorities of an international stamp such as we have ventured to suggest.

‘THE PRINTERS’ INTERNATIONAL SPECIMEN EXCHANGE.’

In September last year, a handsome quarto and vellum-bound volume, originated and issued by Messrs Field & Tuer of ‘N. Leadenhale Presse,’ E.C., appeared under the above title; and now a second volume, a companion to the first, has been issued. Each volume is composed of a collection of specimens of printing—principally letterpress printing—sent in by such printers as desire to exhibit their work in this fashion, and at the same time to share such benefit as is to be derived from comparing their own work with that of other three or four hundred of their fellow-craftsmen. The idea of such a book was first suggested in *The Paper and Printing Trades’ Journal*, and is one worthy of all commendation. Printing is an art admitting, like all other arts, of an infinite variety and modification of design, as well as all degrees and qualities of execution, from the poster on the wall that may be read at a hundred yards’ distance, down to the pocket and miniature editions of Scripture and other works, printed from types so small and delicate as almost to resemble a collection of needles. Between these two extremes, endless modifications are possible, and much scope is afforded the workman for the exercise of ingenuity and taste in his art.

The specimens presented in these volumes are in most cases highly commendable, especially those which have been achieved by the ingenious and tasteful adjustment of types and rules, borders and ornaments. That both compositors and pressmen are likely to find direct advantage from this comparison of each other’s work, along with the critical remarks made by the editor upon each specimen, the volume under notice is the best proof. The least satisfactory specimens are those in which colours have been largely used. Colour-printing requires to be governed by much judgment and taste, so that the respective tints or colours may be kept in due subordination and relation to each other. In many of these specimens this has not been attended to, and we have combinations of red and blue, red and green, red and green and blue, &c., so unduly balanced, that at first sight it is almost impossible to tell which colour has formed the groundwork, or whether there is any such groundwork at all. If blue and red, for instance, are properly subordinated to each other, the effect is good; but if there

is as much of the one colour as the other—and this more than once happens in these specimens—then the effect is questionable as a matter of taste.

We would also suggest that more attention might be given to the production of excellent specimens *in black alone*. This, after all, is the true direction in which the art must be cultivated; and the fine specimens of printing that come to us from America and France, even in the case of some of their weekly periodicals, show that we in this country have not yet by any means attained to perfection in this, the chief branch of the art. In the meantime, it is highly satisfactory to observe that the taste and execution displayed in the second volume are decidedly an advance upon the first; and all lovers of good printing must wish Messrs Field & Tuer the success their *Exchange* deserves.

ON A JUNE MORNING.

THE meadow-lands with golden king-cups glow,  
Strown o’er their velvet carpet of pure green;  
Mingled with snowy pink-tipped daisy stars,  
And yellow-petalled cowslips.

From the thorn,  
The fragrant-blossomed thorn, the blackbird pipes  
A carol jubilant; and close at hand  
His brother-minstrel, the brown, bright-eyed thrush,  
A rival challenge, with full-swelling throat,  
Sounds on the fair June morning!

Bush and tree  
Gleam with soft silver mist; whilst incense sweet  
Of countless flowerets, wet with glittering dew,  
Falls grateful on the sense. And Bird and Flower,  
Meadow and woodland, with bright beauty crowned,  
Silent, yet eloquent, alike proclaim  
The power and wisdom of the Maker’s Hand!

ST GILES’ LECTURES,  
ENTITLED

THE SCOTTISH CHURCH  
From the Earliest Times to 1881.

WITH HISTORY OF ST GILES’ CATHEDRAL.

W. & R. CHAMBERS, Edinburgh and London.

The Conductors of CHAMBERS’S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the ‘Editor, 339 High Street, Edinburgh.’
- 2d. To insure return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. MANUSCRIPTS should bear the author’s full *Christian* name, surname, and address, legibly written; and should be written on white (not blue) paper, and on one side of the leaf only.
- 4th. Poetical offerings should invariably be accompanied by a stamped and directed envelope.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

## LITTLE MEN AND LITTLE WOMEN.

WHEREVER poverty and traffic mingle in our great cities, there is to be found in the by-streets, congregating on door-steps and disappearing down alleys, a weird race of little women—torn and worn with work, grave and sharp-featured from looking after their own interests, tangle-haired and pale-faced, themselves neglected while they take charge of others. Who does not know them by sight, and is heart-sore at seeing them, with their odd mixture of childishness and familiarity with all old-fashioned misery? They carry about babies while they are babies themselves; they scrub steps as soon as they are able to walk up them; they play bo-peep in and out of public-house doors; they learn to steal, and relish beer as soon as they are big enough to go across the street without being run over; the School Board lays hold of them, and they learn their letters; but they know far too much before they know the letter 'A.' They are the countless offspring of city poverty—the old children.

We grieve for them, because, as compared with what childhood ought to be, they have no childhood. But at the opposite social extreme in the highest classes, there are others to grieve for, who, in a far different way, are robbed of the charm of their life's early irretrievable spring-time. Affluence also can be made, and by degrees is being made, through the fashion of the time, a state of life in which there is very little childhood. Luxury and indigence seem here for once to work out the same effect; of course the two conditions produce specimens of human nature as different as black from white; but in neither case is the human phenomenon a child.

Simultaneously with the spoiling of childhood, the decay of boyhood goes on at the very top of the scale. Every one admires boyhood at its best—crowded perhaps with thoughtless faults; but frank, generous, showing manly instincts without alloy of worldly calculation, and yet hiding much individuality from strange eyes by that honest schoolboy bashfulness, which is in itself a mystery.

Unfortunately, whoever knows anything of our great public schools cannot fail to know that, side by side with this true and noble character, there exists another character among our gilded youth, and the name of the second type is Legion. The boys of the fast legion are not boys at all, but diminutive men of the world. They are not content with the annual match at Lord's; probably they have not aspired to be of a rowing Eight, and do not care to 'go in' for cricket or football. They have their books on the Derby; they pick up some knowledge of hunting and shooting in holiday-time; and manage to keep up a more momentous sporting connection at school, or at least to know all about the sporting world. They have their clubs and dinners, their news at second-hand from London seasons, their choice tailors and big debts, their well-developed taste in brands of claret and champagne, and their ways and means of descending to brandy-and-soda. The public schoolboy of this description has been before now praised by the so-called 'Society journals' for his one all-atoning merit: 'With all his follies and vices, he is a gentleman.' Another contemporary has gone so far as to acknowledge boastfully that 'few of our boys are religious, many are profane, the majority are dissipated, and all are extravagant; but they still retain the essence of the spirit of a gentleman—refinement.' What wonder is it that, when such a false standard is accepted, many a son of wealth should find premature vapid dandyism a pleasant exchange for plain hearty boyhood?

Worthy to stand on a par with her elder schoolboy brothers is the latest product and toy of society, the little lady of fashion. She is a child in years, her age only twelve or thirteen; but a child in nothing else. Some mother, unworthy of the name, and with more vanity than sense or love, has brought out her charming little daughter five years before her time, to be shown off in the whirl of fashion, at Prince's and at Hurlingham, at Ascot and Goodwood, at the flower-show and the Opera, and at crowded 'kettledrums' and garden-parties—at which last species of assembly,

indeed, the little ladies of fashion muster in full force as a necessary part of the arrangements. The diminutive *belle* is in appearance like a plate cut out of a fashion-book. She wears a short dress; but that is her only sign of childishness; for the rest—face, figure, and costume are made studious imitations of a grown woman fresh from the hands of milliner and maid. Her face quickly enough learns the looks of her elders, when her manners and conversation are copied from theirs. She is perfectly self-possessed, and can venture any amount of impudent criticism, knowing that it passes for artless chatter; while her rudeness is reported as laughable *naïveté*. She has plenty of admirers, and knows how to keep them in hand; she has learned to flirt while others of her age are blissful at children's parties; she is herself in many cases the flattered plaything of men of the world, while her country cousins are playing with their swings and skipping-ropes. There are, of course, times and surroundings where children appear at the assemblies of older people, and appear as children with a grace and charm that makes them a thousand times welcome; but the atmosphere of the place and company is very different from that in which the small *belles* become forced flowers too apt to lose their bloom. As an instance of the happy advent of the little ones, even into the midst of the glitter and excitement of festivities, we can call to mind recent bazaars for the charities of London, where royal children appeared most lovably and gracefully in a new character; going about among the throng as flower-sellers, selling button-hole nosegays, and with such deft little hands winning plenty of bright coin for the poor.

Even among children who are younger than the little lady of fashion, and with parents who are wiser, we fear there is much being done, unwittingly, to make childhood unchild-like. In dress, there is a gradual return to the custom of making the denizens of the nursery go abroad in their best as men and women cut short. The small folks of two and three centuries ago represented the extreme of this custom; with long dresses and rich brocades, or with powdered wigs and square-skirted coats, they were like *beaux* and *belles* of the period seen through the wrong end of an opera-glass. We do not want to go back to that mistake. But there are many steps being taken towards it—one, for instance, when matrons in charge of preparatory schools parade their juveniles two deep, rebels at heart, clad in knickerbocker suits, kid gloves—and top hats. There is another step being taken towards the mistaken old custom, when children assemble for their Christmas parties all too richly dressed for the games they are to play, the little maids of nine and ten, half proud, but wholly embarrassed by having their plump arms covered with eight-buttoned gloves and silver bangles. In itself, the practice of dressing children for enjoyment in costly stuffs of exquisite make, is proof positive that the little wearers are being trained to be unchild-like in their thoughts and amusements. They are not meant to be glad in using their limbs at frolicsome play, as Nature has intended that they should; they are meant rather to derive pleasure from their own personality; and every one knows that properly constituted children, though they do delight in what they call 'looking

nice,' utterly forget what they look like, the moment they begin to play. It was not one of these new-fashioned, over-dressed children that was lucky enough to be the one little maiden that has interested the child-world most. We are glad that Alice in Wonderland did not wear a French costume and silver bangles; but—how could she? If she did, she would never have had imagination enough to find a Wonderland at all. No little girl could be more charming; though we should be sorry to insinuate that there are not thousands throughout Merrie England quite as charming. But in the case of the sweet, tender, quaintly thoughtful Alice, it is a well-fitting part of her individuality that she was a very childish child, with hair brushed smoothly back, simple short-sleeved dress, and the good old-fashioned pinafore worn not for ornament, but as the useful sign-typical of childhood.

While they wear the costumes of more advanced years, the little people are initiated into advanced ideas. It is said that at least in this respect there are in English life some fortunate obstacles to the growth of the young idea, which, unless in school-life, is a much more rapid process on the continent. One boon at least comes from the custom of dining apart. Even when many strangers are present, young Louis and Julie partake of the late family dinner, and exercise those large ears which are the proverbial distinction of little pitchers. Tom, Jack, Harry, and Kate, who only come on a birthday to the indigestible luxuries of the 'grown-up' dinner, are happily later in learning the wonders of the world.

Out of all this early familiarity with older grandeur and older ideas, and also out of the modern free use of money and pleasure in costly clothing, there comes, as the natural result, the frequent copying of one grown-up notion, which is hateful in men and women, but dreadful and pitiable in a child. It is contempt of the poor. In the mind that is fresh from the creative touch of the Father of all, there ought surely to be no instinctive shrinking from that least of all distinctions among humankind—a poverty-worn look, a shabby garment. There ought to be but one feeling instilled into the hearts of high-born children towards other children less fortunate in worldly goods; and that one feeling, quick to take root in truly child-like hearts, is a generous but delicately unobtrusive sympathy with those who feel as keenly as themselves all childish instincts, but who have less comfort and joy, whose young lives are wedded to hardship and want.

The very opposite to this sympathetic attitude is that of the finely attired daughter of riches, who betrays towards her poorer sisters ugly symptoms of that very ugly thing, childish snobbery. Yet how often both habits of mind find exercise, and the worst shows itself unmistakably even in the sanctuary, where all children ought to know that they kneel as equals. The one child will be nobly ashamed to have the slightest movement mistaken for a shrinking from the poor girl that happens to kneel beside her; the other child, on the contrary, will cast side-glances at the poor intruder, and watch for a chance of sidling away from the possible touch of her clothes, though already she is far from contact with that disgusting thing—another human child's old dress. A few years ago, there was on this point a lesson

deserving immortality given by a poor little peasant girl in a church of Northern Italy. A child well used to wealth and fine dresses, was kneeling beside her governess, when the peasant knelt down near them, quietly saying her prayers. The richly dressed child looked at her: 'Valene!'—the most disdainful word in which an Italian can say—'Go away.' But to the great delight of the governess, the little peasant flashed back her answer: 'If I came into *your* mother's house, into her drawing-room, you might say, "Go away!" But when I come here, it is *my* Father's house as well as yours.'

In a word, then, if we grieve to see in our cities the unchild-like children of poverty, we must not forget that the children of the richer classes are apt also to become in their own way unchild-like; and that it is easy, through pride of display, or under pretext of indulgent kindness, to take away its rightful attributes and its natural charm from the shortest, sweetest time of life. Who is there that would not plead with the poet, 'Come to me, O ye children, for ye are living poems, and all the rest are dead!'—the dear prosaic young folks, who know next to nothing of fashion, and still less of the great weary world—who play noisy games in and out of doors, and sometimes make our heads ache—who talk delicious nonsense at their play, and perhaps tease us with queer questions—who beg for stories untiringly, till they find out that the older head is tired. Child-like children, rich in faith and love, and contentedly poor in pocket-money, *these* are the 'living poems,' unconsciously charming—and mostly in pinafores.

## THE FORTUNES OF BERTRAM OAKLEY.

BY JOHN B. HARWOOD.

### CHAPTER XXVI.—OVERHEARD.

'They don't half like it. It's useless to deny that, Cap'en. It's a big job, you see, Cap'en, a heavy job. And the sentence, if it came to the worst, would be a heavy one too—wouldn't it? Lagged for life, or, anyhow, for twenty years, to Portland Island and Dartmoor and the Bermudys, is no joke.'

'Isn't it?' demanded, in tones of suppressed scorn, another and a deeper voice. 'I'll tell you what, you, Chelsea Ned, I've come to be sick of the world I live in, and ashamed of the lily-livered swabs I'm forced to consort with. Lagged for life, ye lubber! Why, when I was first at this work, it was death, not life, that was the punishment. A chap couldn't whip up a beggarly crown's worth of anything, but he felt as if Ketch's cold fingers were already fumbling at the hempen cravat round his neck. And most of my early mates did die at Newgate, they did.'

'I can well believe you, Cap'en Jack,' responded the first and smoother speaker, in a tone of even fulsome servility.

The spot selected for this singular conversation was as lonely, to all appearance, as though it had not been within the radius of the Metropolitan Postal Delivery. To left and right spread a moist series of marshy fields, the rank pasture of which seemed to serve no ostensible purpose. Indeed, a herd of seals would have been more appropriate there than a flock of browsing sheep, so much did

the surroundings partake of a marine character. Instead of mushrooms or coy violets, ancient anchor-stocks and huge rusty boilers of broken-up steamships seemed to be the natural outcrop of the black and oozy soil; while close by, under the parapet of green and slimy stones, resounded the ceaseless wash and gurgle of the great river.

Very little life, animal or human, was to be seen habitually in these tracts of marsh, intersected by weedy creeks, above which the tall bulrush gently swayed in the summer air; but the very solitude of this uninviting locality had a certain weird charm for Bertram Oakley, who would often ramble there, book in hand, after working hours. He was returning now from one of these evening rambles, when the sound of voices struck upon his ear; and the matter as well as the manner of the discourse seemed to him so extraordinary, that he could not forbear from lingering to hear more. No one could have been less addicted to mere curiosity than Bertram. Talking age, or whispering lovers, as the poet puts it, might have chatted or prattled to their hearts' content unnoticed by him. But here were rogues, and rogues of a dangerous sort, openly plotting against honest men, and Bertram Oakley felt as if he would be false to the duty that we all owe to the society we live in, and live by, if he turned selfishly on his heel. So he listened.

It was evening already. The sun was going down, between bars of gold and gules and sable, gorgeous beyond any coat-armour that herald of the middle ages ever drew, over London. London lay to the west. To the east was, far away, the surging sea, ever answering, ever influencing the big river, whose very life was knit up with the busy, heaving ocean. There was another Thames, a baby Thames, a rural Thames, high up above Teddington, above Reading, and Goring, and Henley; but the real navigable Thames was below bridge, the highway of shipping, studded with ships as the Milky-way with stars, the Thames that throbs responsive to the sea. There are fields beside the river, almost as wet, and almost as green, as the polders of Holland. This was one of them, with a rushy creek running up into it, and half a boat set endways, as an harbour, in the swampy soil at the head of the creek, wherein a small boat lay, close to the bank. The rude harbour made by the old segment of a boat, set up endways, screened Bertram from observation, and allowed him to be, unsuspected, a third party at the interview that was in progress. There was little reason, there, to dread eavesdroppers, though the cloudy smoke and the red glare of London itself were so near and so perceptible in the western sky. It was a solitary spot. Here and there might be seen, dotted about, a lonely farm; or the house of some market-gardener, who risked ague for the sake of gain; or a tavern, with Dutch gables of cracked wood, and bankrupt aspect, hardly to be reached dry shod.

Cautiously, Bertram looked round the westward side of the old boat that formed the harbour, and to which some dried-up tendrils of the scarlet-runner, dead and blackened, yet clung, and gained a glimpse of those whose conversation had arrested his progress. Two men, one old, the other youngish, some three-and-thirty, at a guess. The first was by far the more remarkable. Standing, as he was, in a small boat, leaky and in need

of fresh paint, which was nestled into the muddy water at the head of the creek, the man looked less like a dwarf than like a giant cut short; while from beneath his shaggy white eyebrows, his red, deep-set eyes looked out, full of fire and energy, as if the whole vicious power of that strong vitality had condensed itself into the gleam and glare of those truculent eyes. Yet the man must have been old, very old, for the hair that streamed down, unkempt, from beneath the boatman's fanned cap of coarse waterproof that he wore, was as white as snow. His dress was the coarse garb of a river-side mariner; but it was his wrinkled, weather-beaten face which would have attracted attention anywhere—the audacious, evil face of a veteran miscreant, a grim survival from a buried past, the hideous proof that age may exist without claim to respect or sympathy.

The fellow whose feet were planted on the slushy bank of the creek, and who wore a brown greatcoat, the worse for wear, was merely, to look upon, a longshoreman, such as London fosters in only too great profusion. Every one whose duty or business leads him where such men abound, knows the untrustworthy vagabond that hangs about causeways and river-side stairs, that can pull an oar, yet is no waterman; who knows the rig and flag of every ship, but never saw blue water; the vermin that prey on silly sailors and careless ship-owners, the amphibious thief, scamp, and idler. Such a one was Chelsea Ned. Even vulgar Chelsea, far above bridge and bridges, has her water-knaves, as well as dangerous Deptford, and historic Greenwich, and picturesque Brith.

But it was curious to see how the tall ruffian from Chelsea cringed before the short, thick-set occupant of the boat, and to observe the undercurrent of vanity that warmed the heart of the elder villain. 'Ay, ay,' said the old man meditatively; 'eight-and-sixty years! eight-and-sixty of this fun. Ah, there's not a many like me left.'

'No, indeed, Cap'en,' assented the man from Chelsea.

'Why, my boy, I'm the last River Pirate left. All hanged of the old gang but me,' was the next boastful speech.

'I should think so, Cap'en Jack,' was the meek reply.

'And you flinch, ye swabs, from going in for a big prize like this,' struck in the old mariner promptly. 'When I'm here to lead you, and there's a hundred—a hundred for each man—to be made by it. Sneaks, that you are! A set of pitiful light-horsemen, as you call yourselves, and skulking mud-larks, that buy a copper ring-bolt from a ship's boy, or think yourselves heroes when ye cut a Richmond barge adrift; and when there's a chance like this, it's too hot or too heavy for your hefting, eh, my lad?'

Chelsea Ned, the longshoreman, had his share of vanity too—there are few of us exempt from it—and a sort of flush reddened his sallow face as he winced, perceptibly winced, under the outspoken contempt of his savage auxiliary. 'We'll not be backward, Cap'en, when the time comes to be up and doing,' he made answer sulkily. 'But what my mates and I want to be sure of, Cap'en, is whether we're certain of the swag we run the risk for. Suppose this blessed *Golden Gate* goes ashore down Barking way, or anywhere

except Drowned Point, in Bully's Reach, where shall we be then?'

The veins on the low forehead of the old pirate swelled ominously, and he struck the iron spike of the boat-hook that he held, with vicious energy, into the wet turf of the bank. 'What d'ye take me for?' he asked, in a growl that a grizzly bear might have envied. 'Be I one of your Jenny Jessamy, dandy-jacket water-men, that can just row a wherryful of gaping gabies for a Sunday's pleasuring? or am I Cap'en Jack, that knows every inch of the river and every wash of the tide, as a parson knows verse and chapter? That clipper, when we cut her from her moorings, at the hour I said, on Sunday d'ye hear, goes on to Drowned Point, and no other, or may I never taste rum again!'

Positive conviction is so contagious, and the words of a speaker who thoroughly believes what he says carry such weight with them, that Chelsea Ned's hesitation seemed to evaporate at once. It was in his former deferential manner that he made answer: 'No offence, Cap'en, no offence! I never doubted your word, for one; but some of the coves are new to the trade, and rather timorous about it. We'll be ready at time and place, if you'll have your own below-bridge men, the heavy-horsemen, ready too. But if the watch on board the ship should be spry enough to give an alarm, or'—

'So much the worse for them,' grimly interrupted the fierce old mariner in the boat. 'The watch! We've strength enough, I reckon, to tie them neck and heels, gag them, and clap 'em under hatches. Forty year ago, I'd have set them a-diving; but folks have got too chicken-hearted, I suppose, for the regular thing, nowadays.' And the aged malefactor seemed really to deplore the comparative mildness and humanity of the degenerate times in which he lived.

After this, came an interlude of low, muttering talk, of which Bertram's quick ear could only catch, at intervals, a fragment. 'Keep your chaps soberish'—'Moon's young and night dark'—'Turn of tide'—'Lots of boats, and the carts ready at a whistle.'

Then the conference broke up. Bertram could hear the splash of the oars, as the old river pirate pushed out his leaky skill from the hiding-place; and could hear, too, the heavy, shambling tread of the tall longshoreman as he walked slouchingly away, neither of this precious pair of confederates suspecting the presence of a listener at their colloquy. When the sounds had ceased, Bertram raised his head, and surveyed the field. The field was empty; a black dot on the river represented the departing boat.

'The *Golden Gate*,' he said slowly. 'Our ship! Mr Mervyn's ship! The robbery planned for Sunday night too, when all hands are away.'

#### CHAPTER XXVII.—COUNTERPLOT.

The feelings of Bertram Oakley, as he hearkened, an unsuspected listener, to the talk of the two river robbers, were of no very agreeable description. He had not been long at Blackwall, active in the discharge of his duties, before he learned that the river Thames, like most other things natural and artificial, has its evil influence as well as its good one. It is an artery of trade, without

which London would not be London, nor England England; but it is a fostering place as well of the petty vermin who prey on trade. The mischief which these aquatic thieves do is, after all, very small, when reckoned in tabular columns of figures. They are minor purloiners, petty-larceny knaves. The fierce river pirates of the earlier years of this century, the men who robbed and scuttled West Indians at anchor, are as dead as Turpin and Sheppard. But the mudlark and the light-horseman survive, pilfering, purloining, receiving stolen goods; though it is rare that the heavy-horseman, who pillages ships adrift, appears upon the scene.

This was an exceptional case. The *Golden Gate*, a magnificent clipper-ship, full-rigged, launched from the Yard of Mervyn & Co., was lying some way down the river, waiting, in her maiden freshness, for her trial trip to the Antipodes. A noble ship she was, one of those giants of the sea whose towering masts and immense spread of canvas first enabled them to take full advantage of the steady trade-winds, and with lavish splendour of accommodation for passenger traffic. Steam, as always, can beat sails; but at that time economic reasons made the huge sailing-ships the best carriers for men and goods between the Old World and the Infant World across the globe, and the *Golden Gate* was the pattern and model of a host of others, bespoken by a Company, and ordered, under strict contract as to time, from Mervyn & Co.

And there lay the *Golden Gate* at moorings, new-fitted, full of gilding and colour and silk hangings, and gleaming copper and brass, her stores on board, and most of her valuable assorted cargo shipped; but with no crew on board. She had not yet, in fact, been formally and legally 'given over' to her new purchasers, and had no commander, no fore-castle-men or petty officers on board. There was what, in Thames parlance, was called 'a watch,' left on board by Messrs Mervyn. It consisted of an invalided man-of-war's man, and his son of fourteen; a black ship's cook, honest and merry as a negro can be; a sailor-boy of twelve; and a storekeeper. Bertram shuddered to think of poor Juba the black, and lame Trenchard and his boy, and the other child, and Mr Swaine the quiet storekeeper, confronted by Captain Jack and his gang. There was a dog, to be sure; but what could the dog do?

That the robbery was for that night, Bertram could not doubt. He knew, almost as well as the aged miscreant who had planned the scheme, that in about an hour and a half the ebb-tide would be running strongly down to seaward. That, if it was dark enough, and if the set of the tide exactly served, would probably be the time selected for the attack. It was Sunday. Mr Mervyn and his nephew were absent. The Yard was closed. The workmen were away. It was an evening of rest, of prayer for the few; of noisy, coarse enjoyment for some. The thieves had chosen their time well.

Bertram, as he walked slowly back towards Blackwall, regulating his pace so as to avoid attracting the notice of the longshoreman, whose gaunt figure was still visible in the gloaming, felt himself sorely perplexed. The Yard was closed, and contained no one, excepting Old Joe the gate-keeper, and the night-watchman. The very tele-

graph office at the railway station would probably be shut up; and even if a clerk could be summoned, a message to Mr Mervyn would produce little effect. Long before aid could come from London, the work of plunder—of murder, possibly, for the satellites of Captain Jack were not likely to be scrupulous in suppressing the resistance of the faithful few in charge of the clipper—would be completed. As useless would it be to hire a wherry, and warn Trenchard and his companions of their danger. The sheep-dogs were all too weak to beat off the swarming wolves from the fold.

Bertram had a long walk before him. It led him past the new, tall ship, the stately *Golden Gate*, lying at anchor, unsuspectingly, in the deep-water channel, her paint bright and glistening, the brailed-up canvas lying in snowy festoons along her yards, and her lofty masts overtopping those of coal-brig and Dutch trader, as the sky-piercing spire of some cathedral lords it over the belfries of ordinary churches. Bertram heard the tinkle of her bells as they struck the hour, and heard the dog bark on board of her, responsive to the barking of other dogs on board of other vessels at anchor within hearing. It was late enough now for her lights to burn, and bright and clear they shone at stern and bow. There was a dull red glow from the galley-fire where Juba reigned among his kettles and saucepans; but no human form was visible. The handful of poor, faithful fellows on board the fine new Australian clipper obviously apprehended no danger but that of a possible collision with some Irish steamer or outward-bound Indiaman.

Bertram, on reaching Blackwall, went straight to the police station. Here a disappointment awaited him. The superintendent was away, and the commanding officer for the nonce was a spruce young sergeant, whose glossy whiskers seemed to have been developed to the detriment of his brains. He declined to lend any credence to Bertram's story.

'We, of the Force,' said the sergeant, tightening his belt and pulling up his stiff black stock as he surveyed Bertram with supercilious disbelief, 'can't afford to waste our time over all the fancies of the Public. Of course, when we're wanted, here we are. Duty's duty. When an information is properly signed, and sworn to, of a felony committed, then the police can act. But with moonshine, and mare's-nests, and cock-and-bull stories, the less the Force concerns itself the better. The Public should not cry out before it's hurt.'

And indeed the young sergeant, who had but a single disposable constable under his orders, appeared to consider that against that impersonation the Public, for the moment represented by Bertram Oakley, he had a genuine grudge and substantial cause for complaint. 'Besides,' he added, presently, 'if it's on the river, the Thames Police should see to it.'

To the waterside station of these aquatic guardians of order, accordingly, Bertram repaired. There he obtained a more respectful and a more patient hearing from the Acting Inspector left in charge; but there, too, he was doomed to disappointment.

'It's a queer story, and an unlikely thing to happen,' said the officer ponderingly. 'But I'd

not take on myself to say the conspiracy may not be a real one. That old Captain Jack, Mr Oakley, is only too well known, below bridge, as a desperado of the worst sort. He was as near being hanged once, I've heard, as— Well, well! The worst of it is, you see, that the galley is not here. If she gets back from Deptford in time to be of use, I will lay the case before the Superintendent, and I have no doubt of his immediately taking steps to protect life and property.'

These interviews, while affording but cold comfort, had of necessity consumed much time. The tide had turned, and was running, strongly and swiftly, out towards the Nore and the sea, aided by the freshening south-west wind. The vessels at anchor, save only such as were moored, stem and stern, swung round at their anchorage, and the lap of the muddy wavelets, and the gurgle and splash of the river, grew louder as the ebb set fairly in. Still, what was Bertram to do? Already, perhaps, the old pirate and his rufian gang had quitted the lairs where, like night-hawks whetting their beaks for prey, they had been lurking, to rush upon the rich prize. No hope could be entertained of any effectual assistance from neighbouring craft. The few coasters or foreign vessels within hail, weak-handed, and with their commanders probably ashore, would pay little heed to the sounds of scuffling or outcry on board the new clipper.

Ha! That was an idea at last, that promised help! Bertram had strayed on until he found himself standing in front of the wooden porch of a large public-house, of decent repute, yecept the *Shipwrights' Arms*, whence through the red-curtained windows came the sounds of many voices, mingling with the jingle of glasses. This, as he knew, was the tavern especially patronised by the brawny artisans in the employ of Mervyn & Co. He knew the men, and the men knew him. He resolved to make an appeal to them, pressed, as he was, for time. Bertram, his mind once made up, was not one to hesitate as to the execution of his project. A moment, and he was in the middle of the great room, with its sanded floor, and little green-painted tables, around which sat, drinking and smoking, singing and conversing, a miscellaneous company, in various stages of intoxication. All, or nearly all, desisted from their occupation to peer inquisitively through the clouds of tobacco smoke at the intruder on their riverside haunt.

'Mervyn's men, I want you, want your help, lads, to save your kind master's property from robbers' hands, and to save the lives and limbs of those left in charge of it!' cried Bertram, springing upon a window-sill that the audience might get a better view of him.

Then there was a clamour of voices. 'What's up?' 'Is the yard on fire?' 'Quiet, mates, and let Mr Bertram speak!'

'This is what's up,' answered Bertram quickly. 'A set of blackguards are gone to cut adrift the *Golden Gate*, to rob her of her fittings and cargo when she grounds in Bully's Reach, with the ebb that's running strongly. The watch on board will be overpowered, and perhaps flung into the Thames, unless we take boat and go quickly to their assistance. I promise every man who joins, in Mr Mervyn's name, that he shall be rewarded.

But, lads, I know your honest hearts too well to think it needs that to make you bear a hand, like Britons, in this pinch!'

It is generally safe, as more experienced speakers than Bertram have approved, to appeal to the nobler sentiments of a crowd, when you use a language that the popular mind can comprehend. When men are gathered together in any numbers, they seem, somehow, to be ashamed of being selfish.

'I'll go, for one,' shouted a big shipwright in his shirt-sleeves, flinging his pipe to the floor as he jumped to his feet. 'It's a shame, I say, to let a finger be laid on whatever belongs to Mr Mervyn—and the *Golden Gate*, too!'

'I'll bear a hand!' 'We all will!' 'Hurrah for young Oakley!' 'Come along, my hearties!' shouted a score of willing voices. There were some dissentient grumbings, however, and there were those who affected to disbelieve the tale. But Bertram persisted, and, his personal popularity assisting, he carried the majority along with him. Out of nine-and-twenty volunteers he was, however, obliged, as delicately as he could, to decline the services of those who were too drunk and noisy to be fit for the expedition. There remained a compact body of nearly twenty strong fellows, who embarked willingly on board of boats that lay moored at the foot of the stone stairs, and the use of which the watermen to whom they belonged were ready to grant in hopes of future recompense. Wisely, Bertram had forborne to mention, before that mixed assemblage, the names of Captain Jack or of Chelsea Ned.

'Pull away, lads, and with a will!' cried Bertram, as the boats pushed off.

### SOME STORIES ABOUT DOGS.

FROM a number of communications addressed to us from time to time on the intelligence, cleverness, and sagacity of our humble four-footed friend the Dog, we make a selection of anecdotes bearing upon these and other traits in his character. In all the cases given, the stories are within the personal knowledge of the narrator, and may therefore be taken as strictly authentic. The first is from a minister of the Church of Scotland, who writes as follows:

Dogs are always credited with kindness, sagacity, and faithfulness, but not often with humour. My experience, however, has led me to conclude that, as a rule, they have an intense sense of the ludicrous. It varies, of course, with different breeds, a large dog inclining to fun, while an English terrier is generally a cynic; but every dog, except ladies' lapdogs and obviously stupid animals, has some sense of humour in his character. Some years ago, I had a fine retriever who had the most unmistakable enjoyment of fun. This was indeed a kind of failing in poor Humphry (he is now dead), and led him into excesses he afterwards plainly regretted, both as a dog and as a minister's dog. But though I must say he had a becoming sense of his position, and on visitation or at a session meeting, conducted himself with blameless propriety, he could hardly resist an opportunity for a practical joke.

One minister who visited my manse occasionally, was a favourite victim. The good man, who

had not a gleam of humour in his disposition, was morbidly afraid of all dogs, and was quite convinced that Humphry in particular was bent on assaulting him. It was in vain to assure him that Humphry was the very paragon of good-nature, and to point out that when we were all out walking together, he never once offered to annoy him. My friend was persuaded that if Humphry only got him alone, he would play some trick upon him. In fact, he would not take a turn in the garden without assuring himself that that 'brute of a dog' was not prowling about; and I now think he had reason.

One day, having satisfied himself that Humphry was out of the way, he went out to a favourite walk that ran along beside a high hedge, and began to ruminate over some theological problem, as he paced backwards and forwards, free from all anxiety. Then, to my amusement, as I freely confess, I saw Humphry's black but most intelligent countenance peeping out from an opening in a hedge at the upper end of the garden, and watching with keen delight his unsuspecting prey. He then squeezed himself through, trotted down the garden in a stately manner; and just as our friend was approaching the end of the hedge, Humphry presented himself, and gave one bark. That bark can hardly be described; but all my readers who know the sound of fun in a dog's bark, can imagine it. The look of dismay in the minister's solemn face as he found himself thus suddenly at his tormentor's mercy, was a study; and he began to retire backwards, as from the presence of royalty. This proceeding, Humphry, who was simply playing on the man's nervousness, watched with much relish; and then, when it had landed our friend half-way up the walk, he hurried along the other side of the hedge, and repeated the former bark—this time *behind* the minister, whose self-possession now gave way, and gathering up his coat, like a child wading through water, he made a clean bolt for a neighbouring summer-house. Humphry was quite unable to follow him. He lay down on the grass, and literally rolled in an ecstasy of delight.

When I arrived on the spot as a relieving expedition, Humphry had recovered himself, and was seated before his friend's place of refuge, listening with much complacency to a string of conciliatory remarks: 'Fine fellow,' 'Poor dog'—as if he had been a lapdog—and suggestions such as 'Pussy, pussy, sh—sh, cats,' but steadily maintaining his position of watchfulness. But as soon as I made my appearance, he seemed at once to realise his undignified and inhospitable conduct, and hurriedly retired from the scene with an expression of deep repentance in his ears and tail. After this unfortunate incident, I could no longer stand up for his innocence, and was obliged to shut him up during the minister's visit, lest the very sight of the man should be too much for Humphry's virtue.

By accident, I learned one day another of Humphry's standing jokes; for, as I said before, he was the most staid of dogs when with myself. One of my elders, a most kindly and useful man, was little, and slightly deformed; and I noticed that Humphry took much interest in him. However, they were excellent friends; and I never suspected how much the elder suffered for this friendship, till I saw him coming along by the

side of the church, and pressing himself against the wall, while Humphry accompanied him, giving derisive barks, and inviting the little elder out to the open road.

'Dear me, John, you are not afraid of Humphry. What in the world are you doing?'

'I daurna leave the wa'!' said the poor man, who proceeded to explain that the moment he did so, Humphry, if in a mischievous mood, would run in between his legs and capsize him on his back. But he added, with a kindly look at Humphry, who remained at a safe distance: 'Dinna thresh him, for he's a fine dog; and it's jist his natur—he's that fond o' a joke.' A rather rough one, however; and I induced Humphry to abstain from it in future. But as often as he saw the good little man shuffling along the road, a gleam of suppressed fun came into his expressive face.

On another occasion, I heard a great noise, made up of women scolding and dogs barking, in our village washing-green; and looking out of my gate, I saw that in the centre of the green was spread a large washing, and on the central shirt sat my little English terrier. What had made him take up that position, I cannot tell, except pure mischief; but there he was sitting, and receiving the angry threats of the woman in charge, with an ill-natured growl and a gleam of his teeth. Up above on a knoll, I saw that Humphry lay stretched, viewing the whole affair with deep interest, and joining in the conversation at intervals with a most comical 'bouf.' The moment I showed myself, both dogs recollected some business they had up the way, and disappeared, while I made an apology to the good housewife. 'But why did you not drive Jackie off your shirts?'

'Drive him aff! Little ye ken him. He's jist a wee Sattan, and hauds oor green in bondage. But I wonder sic a sony beast as Humphry wud coontenance sic tricks; only a'budy kens he'll dae onything that's droll.'

Yes; that was his failing. The kindest of dogs, the pet of all our children, the protector of all little dogs, and the most affectionate of companions, he was apt to forget himself on such occasions. His penitence afterwards was, I believe, really genuine, for he was a dog of fine feelings; but it was too short-lived, and nearly every week was signalled by some new escapade. Yet he was perhaps the most popular character in our district, was welcome in every house, and when he died—poisoned, as we supposed—Humphry was universally regretted. 'So Humphry's dead,' said one whom he often teased. 'Weel, he'll be sair missed, for he was a droll dog.'

My mother used to tell a good story of a Newfoundland. My grandfather was fond of driving high-spirited horses, and on one occasion my aunt refused to go into the conveyance, and determined to walk; my mother, however, ventured. Their Newfoundland dog was with them, highly delighted, like most of his kind, to follow the gig. On their way, they came on an ill-looking couple, who evidently attracted the dog's attention also; for on reaching them, and apparently taking note, he left off following the gig, went back to my aunt, came with her past the people, and then set off at full speed after the gig.

Another incident my mother used to speak of, when she considered herself saved by a Newfoundland dog—whether the same one or not, I do not know. She was very fond of collecting seaweed; and knowing her proneness to be tempted to go into danger, a dog was usually with her. On this occasion she wished to pass a point where the sea was lashing up; but the dog would not move. She tried every effort to induce him, but tried in vain. Baffled completely, she had to go round by the street, the faithful animal now going quite willingly. Evidently, he had comprehended the danger, and determined to do his best to make his mistress avoid it.

My friend Kate S—, while on a visit to us, told me the following story of a dog, which belonged to her father some years ago. Mr S—, a clergyman, kept a great many hens, which laid very well, excepting, as it seemed, on Sundays; for when the places wherein they deposited their eggs on the week-days were visited on Sundays, there was never an egg to be found in any nest. This could not be accounted for; and Mr S—, at last growing tired of missing his eggs one day in the week, left a member of his family at home one Sunday, in addition to the servant who usually remained, while the rest were at church, to watch. The person so left had suspicions as to the honesty of Gip, the pet dog of the family. At all events, Gip was kept in ignorance of the fact that any one was left on the watch; and soon after church-time, the watcher saw him stealthily going towards the fowl-yard—a very extensive one. The watcher took measures to observe his further proceedings more narrowly, and saw the dog take the new-laid eggs in his mouth carefully, one by one, and hide them in a heap of rubbish in the orchard. When he had completely robbed the hen-roost, he proceeded to scratch a hole, to which he transferred the eggs in a more leisurely manner; then scratched the mould over the hole again, and left the place. This discovery was made known to Mr S— on his return from church; and further watching during the week revealed the fact, that Gip went every day to the hole and partook of his stolen goods. After sucking one or more eggs, he scratched the earth over his storeroom, and went 'back to busy life again' with quite an innocent bearing.

Gip was especially fond of one of the boys of the S— family; and when, as sometimes happened, this boy was sent to bed in disgrace, the dog would follow him to his room, climb over the side of his crib, and remain lying beside him all day, snarling at any one who came near. Mrs S—, the mother of this boy, has a little dog now, named Flop, who loves her so, that when she leaves home, it whines and cries, while the tears positively run down its little face; and this distress begins when the preparations for her departure are being made.

My dog Jim lived in our family quite fourteen years. His mother was a very well-bred and game-looking Scotch terrier, and his father a nearly white Skye; but notwithstanding the good looks of both his parents, Jim was an ugly, thin, long-legged creature; a very pretty head and bright eyes being his only beauties. He had also a black nose and black paws, as signs of good blood. He attached himself to a few persons with par-

ticular affection; but he was polite to all of whom he was not afraid. He was very intelligent, though not very apt at learning what are called 'tricks,' but which ought more properly to be called 'accomplishments;' and had a faculty for putting this and that together, which certainly in many instances was startlingly very like clear reasoning. But the instances are so interwoven with one's everyday life, and so likely to seem only commonplace when written—although to us who noted them they were very interesting—that I forbear to set them down here.

He considered cats as things to be chased; but he was polite to our house-cat, although positively sulky when she came and sat by him on the hearth-rug. One day, we saw him tearing down the street after a cat; but when he came up to her, he recognised her as our cat, turned away at once, and came home hastily, his tail down, and with the appearance of one who is thoroughly ashamed of having committed a silly mistake. His eyesight became defective for many years before he died, and owing to this, he would mistake persons at a distance for members of his own family. I remember one day at Buxton being seated near Cavendish Villas, and looking down into the public gardens. Jim was standing beside me, and presently I saw his tail gently wagging, and looked to see who was near that he recognised, but for some little time could find no reason for the wagging of the tail or the cocking of his ears. At last, I saw a gentleman standing watching the ducks in the ornamental water some little way off, whom I at first thought was my father, as Jim evidently did, and for the same reason, namely, a trembling of the right hand, which was violent enough to agitate the stick upon which the right hand rested. My father unfortunately suffered from this form of paralysis, and Jim had recognised the peculiar symptom in this stranger. When the gentleman began to walk towards us, Jim advanced to meet him; but before he reached him, he discovered his mistake, and returned with tail down and abashed looks, as in the case of the hunted cat. I remember Jim's mother used to wag her tail in the same gentle manner when the feet of her master's children pattered across the nursery floor overhead.

Jim became nearly blind and very dull of hearing in the winter of 1867, and although he always started out to walk with my father—then in very feeble health he came home again in a few minutes, barking and scratching at the garden door until some one let him inside the walls, when he would hurry to his particular corner in the dining-room, where he was out of the way of being stumbled over or disturbed. My father was not obliged to remain in his bed more than four or five days before he died; and on one of these days, Jim, who had never done such a thing before, went out at the front door, sat down in the middle of the path, and howled long and dismally. I went out, and patted and spoke to him; but he did not appreciate my caresses, and returned to his corner without so much as a wag of his tail. As I have said, he was never known to howl before, and he never did it again. When my father died, Jim curled himself up on the mat outside his door, and there slept all day, although it was winter, and there were fires, which he keenly appreciated

usually, in the sitting-rooms. He kept the most striking proof of his power of reasoning—for so one is tempted to believe it was—to do honour to my father's memory. The funeral—a walking one—was starting, when Jim suddenly emerged from some part of the garden, looking almost young again, with his tail well up, and deliberately headed the procession, going before it through the little town of Dursley, Gloucestershire, up to the cemetery of St Mark's Chapel, which was quite three-quarters of a mile from our house—a long way for a dog who for many months had seemed to think that to be away from home to the extent of only a few yards was too much for his strength. I am told that when inside the church, he sat quietly under a seat, but not near any one he knew—he had no affection for my brothers, who had not lived at home for years—and headed the line again as the funeral party went out, and took a place by the grave, gently wagging his tail as the service was read. I, watching for the return of the funeral party, saw him enter the gate before them; and I was told that he had come home first all the way, as he went. He trotted quietly to his usual place, with his tail still well up, and a look about him as if he was conscious of having done his duty. He never went out walking with any of us after this, and seemed to care very little for anything, although he lived without pain and discomfort to himself apparently, until 1870. His conduct at his master's funeral made quite an impression on our cottage neighbours, one of whom said to one of my brothers, who returned home from South America three months after my father's death: 'Ay! poor old Jim, sir, he followed your father to his grave with the rest of them.'

One of the most intelligent dogs that I think ever existed was a fine brown retriever, of what is called in the neighbourhood of Castle Granard, 'Lord Forbes's breed.' He was of unusual beauty, a perfect specimen of his kind; highly trained to retrieve by land or water; of sweet disposition, a most affectionate companion; and, with reason, considered to be invaluable. His gentleness towards little children was invariable; even an infant would be as safe in his charge as in that of a nurse. He particularly enjoyed romping and playing with older children, joining them in their games. 'Puss in the Corner' was especially entered into with great delight, running and barking vigorously at each change of position; and if a dog can be said to laugh, he certainly did so. No game was thought complete without 'dear old Bob' as one of the players. His tricks and accomplishments were numerous. Having passed his life amongst soldiers, he had learned a great variety in the course of his extensive education. He had of course been taught to balance a biscuit on his nose while the orders 'Make ready, present, fire!' were pronounced, waiting with military discipline till the last syllable was said, when he threw up the biscuit, and caught it in his mouth. He would shut a door at command, standing on his hind-legs and forcing it to with his fore-feet; shake hands with all visitors, offering first one paw and then the other; and also ring the bell, being greatly troubled where there was no bell-rope to pull with his teeth.

A valet could not have more courteously fetched

slippers, or taken boots to be cleaned, returning them when ready for use. A pair of goloshes, however, were one day given to Bob, with directions that they were to be taken down-stairs. Perhaps, for some peculiar reasons of his own, he may have thought the intention was to get rid of them; at anyrate, they were never brought back, and not having been required for some days afterwards, they were not at first missed. When asked for, they could nowhere be found. Every part of the house and outbuildings was examined without effect. At length, it was recollected that they had been intrusted to Bob, as above described. His assistance being requested, he appeared anxious to explain the mysterious circumstances of the case, wagging his tail and looking very wise; but the goloshes still continued lost. Bob had frequently been noticed burying his own discarded property; and as a forlorn hope, it was suggested that in this manner he might also have hidden the overshoes. His favourite region for secreting bones and such unconsidered trifles was known, and thither Bob, seeming highly amused, led the way. The ground did not look as if it had been lately disturbed, yet, for a last resource, it was decided to make an investigation. The earth was carefully removed; and at some depth below, the goloshes were laid open to view. No gardener armed with spade and rake, could have concealed them more effectually, or done his work in a more skilful manner.

Bob had acquired a curious trick of lying completely motionless on hearing the word of command 'Dead!' and although he might be left for several moments, never rose till permission was given to do so. Nothing could exceed his dexterity at finding articles purposely hid, in most unlikely places. Letters lodged on boughs of trees, nearly out of his reach; gloves, whips, sticks, left in hedges; handkerchiefs dropped at any distance—all were alike discovered and restored. The more difficult a task might be, the greater gratification its mastery afforded. He was always greatly excited at the sight of a gun; and one of his favourite performances was a pretence of being out shooting. A walking-stick served for this purpose; and he went through all the assumption of anxiety during the process of loading, cocking, and firing 'the gun.' No sooner was the exclamation 'Bang!' made, than he bounded forward to find 'the bird' with great glee, seizing on any available object, such as a shoe, to represent 'the game.'

While engaged in any of his tricks, Bob always walked with a conceited species of strut, that can be best described by comparing it to the gait of a circus-horse which is supposed to be dancing or marching. He had not the least objection to music generally, having been accustomed to it from his earliest years; but nevertheless showed a strong and incurable aversion for anything approaching to the tone of a flute. Possibly this dislike may have arisen from the primitive and unmelodious efforts of some juvenile member of a military band. So inveterate was the prejudice, that merely pretending to play on a ruler, whistling a tune, bore too close a resemblance to be calmly endured. Bob took great notice of any change in the expression of his friends' faces; an endless amusement thereby was afforded to children, through leading him to watch, while they

made a series of grimaces, during which his eyes were eagerly fixed on their countenances. He cleverly affected to be extremely angry, growling and barking, though evidently realising the joke. Bob also observed the faintest alteration of voice, and even of accent; for if addressed in an Irish brogue, he became wildly excited, doubtless hailing the sound as a pleasing reminiscence of his native land.

Bob was equally at home on sea or land; and he would leap from great heights into water, and swim and dive like a duck, to recover whatever might be thrown in for him. During a shooting expedition, he had, as usual, much distinguished himself by his professional services, and none present had more fully appreciated good sport. The last pheasant that had been shot could not be found. After a prolonged delay—during which he was invisible, having received orders to find it—and as evening was coming on, further search was abandoned. He was repeatedly called and whistled for, but in vain. Collecting the other dogs, the shooting party reluctantly started for home without him, their destination being many miles away. About ten o'clock, a welcome summons resounded at the hall door, where Bob made his appearance, walking in his most conceited style, holding the pheasant, perfectly uninjured, in his mouth, which he politely presented, showing every sign of satisfaction at the successful result brought about by his own perseverance.

As Bob advanced in years, his morals, upon the one subject of the Game Laws, sadly deteriorated. He began by killing forbidden birds and rabbits, bringing them, with a touchingly innocent demeanour, as if only well-meant contributions to the larder. Later in life, he became a regular poacher, remaining out all night whenever an opportunity could be found; and, not contented with descending to such evil courses himself, he succeeded in contaminating another dog—which knew nothing of field-sports beyond orthodox rat-catching—by inducing him to join in these disreputable practices. When the erring pair came home at early morning, after their nocturnal excursions, it was too obvious that they had not merely been occupied in hunting rabbits, &c., but, lamentable to relate, had also eaten them! The guilty, yet mischievous expression of the principal offender on these occasions, can be better imagined than described. Such reprehensible tendencies involved a necessary curtailment of liberty. With this single exception, our old friend continued to the close of a long and memorable career, a highly refined and most original character, a veritable gentleman amongst dogs.

### A CLIFF ADVENTURE.

In the far north, long ago, when I was a boy, my brother and I used to be expert cragsmen—if I may use the term. Few things gave us more pleasure than to scale all the steep precipices, of which there was no lack in our neighbourhood. These precipices ranged from one hundred to four hundred feet in height. We were never troubled with giddiness, and boy-like in such a pastime did not know what fear meant. I daresay if there had been nothing whatever to procure, the 'danger's self' would

have been 'lure alone.' Dangerous it certainly was, and many a narrow escape we had. I shudder now at the thought of the places in which we ventured. I have often since these far-away days looked at some of these places, and wondered at our foolhardiness, and I would not for any consideration now attempt to repeat some of our escapades. But to add zest to the thing, there were multitudes of birds' nests in those precipices—hawks, gulls, kittiwakes, guillemots, pullins, cormorants, and many others. We made a fine collection of eggs; and any that we might obtain beyond our own requirements, we could always exchange with friends or dealers for others not procurable in our part of the country. Moreover, many of the commonest kinds of eggs, as those of all the gulls and guillemots, were excellent eating when fresh and boiled hard. One of our adventures very nearly proved tragic.

We had often tried—but had always failed—to obtain any ravens' eggs for our collection. We were anxious to procure specimens, and determined that somehow or other we should. Now, be it known to those who are not acquainted with the character and habits of the 'bird of ill omen,' that he is one of the most sagacious and cunning of the feathered tribe. He builds his nest high up in the most inaccessible cliffs, so that it is almost always impossible to reach it except with the help of a rope; and even with such assistance, it is no easy task. We knew of a raven's nest about fifty feet from the top of a very steep and bare precipice of four hundred feet which there was no possibility of scaling in the usual way. Above the nest, the cliff was partly overhanging; and beneath and on both sides, except the spot chosen for the nest on a solitary shelf, it was smooth and steep as a wall. For many years, the same pair of ravens, safe and unmolested, had occupied this spot and reared their broods; but with the pertinacious ardour of boyhood, we were resolved they should no longer find that their eyrie was impregnable, and we laid our plans accordingly. It was necessary to have recourse to a rope, that one of us might be lowered down from the brow of the cliff; also a pulley, in the form which sailors call a 'block,' was required; for one of us would of course have been unable to haul up the other with the single rope only; but the doubling of the rope by means of the block would diminish the weight and pressure by one half, and bring the task well within our strength. Accordingly, we obtained a coil of about forty fathoms of rope, such as is commonly used for the sheet of the sail of a small boat; also a small block and a strong oak stake.

The brow of the cliff was a smooth grassy sward, the turf being hard and, to all appearance, tough. We secured one end of the rope to the stake, which we drove firmly in the ground right above the raven's nest. My brother was to make the descent; I was to stand by the rope and manage the lowering and hauling up. A small piece of wood to sit on having been attached to a loop of rope and secured to the lower end of the block, all was ready for action, and the descent commenced. Slowly I paid out rope. I could not see over the cliff, but was quite within easy ear-shot, and every second or two the shout came up: 'Lower away, lower away;' at last it was: 'Hold hard;' and in a little: 'All right. Haul up now.'

I knew that the prize was won, and began to pull away lustily and cheerily; but when I had recovered not more than three or four yards, to my horror and dismay, I noticed the treacherous soil yielding to the strain, and the stake being drawn. I had barely time to seize the stake-end of the rope. Another moment, and the stake would have been wrenched out of the earth and dragged right over, and— Well, I daresay I should have held on; I am sure I should; but that would have been of no avail. My poor brother must have fallen down, down till the block caught the stake with a jerk, which would have fetched me over too, if I had kept my hold; and down those terrible hundreds of feet, we should both have been dashed to inevitable destruction. As it was, the situation was dreadful enough for us both. For some time at least, I could hold on, but that was all. It was beyond my strength now to haul in one yard of rope.

'Haul away, can't you!' shouted my brother, little thinking what a frightful thing had happened.

I paused a moment before answering. I was afraid, when he knew the truth, that he might faint or lose his presence of mind at the appalling position in which he was placed. I did him injustice. A braver, cooler spirit never beat in breast of man or boy. 'Don't be alarmed,' I cried; 'the stake is loosening a little.' That is how I put it, to lessen the shock to his nerves. 'Keep still a moment,' I added, 'till I see what can be done.' But in truth I could not think what was to be done. I could do no more than keep my place and my hold.

'Has the stake entirely slipped its hold?' he cried.

'I fear so—yes,' I replied. 'But don't be afraid; I can easily hold you as you are till we think what can be done.'

He knew the worst then; we both knew too well the peril of the situation. Had he been only a few feet from the brow of the precipice, he might have got up by the rope hand over hand, for he was light, wiry, and active, and his muscles strengthened and toughened by constant exercise, gymnastics, rowing, cricket, and the like. But nearly fifty feet! It was out of the question—it was impossible; and we both knew it. Moreover, we had no hope of help coming. There was not the slightest chance of any one passing that way; for the cliff was far away from human habitation, an isolated headland at the extremity of a peninsula, where a few more than half-wild sheep grazed; a place, therefore, which no one had occasion to visit except the owner of the said sheep, two or three times in a year. Of all this, we were perfectly aware.

'What's to be done?' at last I cried. 'But at any rate don't get shaky.'

Firm and clear came up the reply: 'Shaky! old fellow. No! that I shan't, and I know you won't either. I know you won't let go. We shall do yet, never fear. I am thinking of a plan.' And then, after a moment's pause: 'I have it. If you hold hard by the stake-end of the rope, and slip the other over, I'll slide down till I reach some footing. Wait till I shout that I'm all ready, and then kick the rope out as far as you can, that it may not come down on my head. You understand?'

'All right,' I shouted back, instantly comprehending, and immensely admiring the ready wit of the device. 'Be careful in moving. Don't jerk. Give the rope a twist round your legs, and slip down slowly.' It was not without danger that this could be done, and everything depended upon steadiness and nerve. Haste or flurry would in all probability have been fatal. He had to disengage himself from the loop in which he was sitting, pull himself up a few feet, and get firm hold of the rope with hands and feet above the block; and to accomplish this, hanging as he was in mid-air, was no easy matter, as the reader will readily understand. In a few seconds, I knew by the strain on the stake-end of the rope, that he was transferring his weight to it alone.

'Now then,' he cried; 'pitch away; I'm ready.'

There was no tension now on the longer end of the rope. With both hands, therefore, I grasped firmly the stake, and kicked the coil as far as I was able. 'All right!' my brother shouted. 'Hold hard now, and I'll slide down slowly.'

We knew the rope was not long enough to reach all the way down to the rocks and boulders, where the sea was grumbling; but we had good hope that a hundred feet or so down he would find footing. In little more than a minute, I felt the tension suddenly cease, and grew deadly faint from the terrible fear that he had lost his hold. The next instant, to my inexpressible joy, I heard his far-off shout: 'Right now, old fellow. I've got good footing, and will be up directly; it's all plain sailing now.'

I ran along the brow of the cliff, to a point from which I could see him. I seemed scarcely able to realise that he was safe till I actually did see him. He was nearly half-way down; and we waved mutual congratulations to one another. After a few minutes' rest, he passed along laterally for some distance, and then ascended by an easy part of the precipice which we had often before traversed. At last he set foot on the green turf, where I was anxiously waiting him. Each looked at the other's flushed and streaming face, and I am bound to acknowledge, that though we tried very hard, we ignominiously failed to repress a little blubber.

#### THE COST OF A GENERAL ELECTION.

In the delusive expectation of curbing the extravagant propensities of energetic electioneering agents, and limiting the profuseness of their uninquiring clients, Parliament has, in its wisdom, enacted that every candidate for a seat in the House of Commons shall furnish a detailed account of the money expended on his behalf; the latest result of which enactment is the publication of a Return of the charges made by Returning Officers, and of the total expenses incurred by each candidate at last year's General Election.

Before proceeding to analyse this curious Parliamentary Paper, we must premise that it is by no means so complete as it might and should be, owing to many of our legislators and would-be legislators, for reasons best known to themselves, declining to fulfil the requirements of the law. The senior members for Liverpool, the members for East Staffordshire, and the candidates for the representation of Radnorshire, omitted to furnish

the officials with any account of their disbursements; the like reticence having been shown by no less than seventy-six out of a hundred and seventy-one Irish candidates. For some few cases of similar default, there is reasonable excuse. The returns for the two divisions of Shropshire and the borough of Shrewsbury are wanting in consequence of the papers relating to them having been destroyed in the fire at the Shrewsbury Town Hall; while the Sheriff of Derbyshire declares himself unable to render detailed particulars of the election charges in the three divisions of that county, owing to his Officer having wilfully destroyed the books and papers from which alone the information could be obtained.

Imperfect as the Return confessedly is, not a little interesting and curious information may be gathered from its half-hundred pages of figures. First in order come the unavoidable or official expenses, representing the cost of polling-booths, dies, ballot-boxes, ballot-papers, advertising placards, stationery, clerks, sundries, and fees to Returning Officers; the amount (in contested elections) ranging from twenty-six pounds in the Yorkshire borough of Richmond, to eighteen hundred and sixty-one pounds charged in the city of Manchester.

The compiler of the Return has thought it worth noting that the Returning Officer at Waterford received only thirty pounds from each of the successful candidates, and twenty-five pounds from the unsuccessful ones; out of which sum, after paying all expenses, he had but ten pounds eighteen shillings left to pay himself for his trouble. This dissatisfied gentleman had certainly good reason to envy his brother-officials of King's County and Stoke-upon-Trent, seeing that their labours were rewarded by the receipt of two hundred and sixty-five pounds in the one case, and of two hundred and ten pounds in the other. At Grantham, the presiding Officer was contented with the modest fee of four guineas; and some still less exacting gentlemen were satisfied with obtaining a fourth of that sum from the successful candidate only. At the University of Oxford, no official charges whatever are made, whether the seats be contested or not; and the same rule obtains at the University of London, all expenses being charged to the parliamentary vote for the University. In Scotland, the Returning Officers receive nothing for themselves, not even being repaid their outlay for travelling and other personal expenses; an arrangement seemingly to the mind of the Officer concerned with the election for Tipperary, who claimed and took nothing for his valuable services.

Were the official charges the only ones to be met, men owning but moderately filled purses might have a chance of winning their way into parliament, which is scarcely possible as things really are. In the lesser constituencies, money melts in a mysterious way; and to fight the political battle in a large constituency runs into thousands of pounds; even where economy is the order of the day. Take Birmingham as an example. Here the old members eschewed the employment of paid canvassers, and had the benefit of a perfect party organisation; and yet Messrs Bright, Muntz, and Chamberlain had severally to expend more than two thousand pounds: which means that each of these gentle-

men pays something like four hundred a year for the honour, while it lasts, of representing the great hardware town, their only consolation being that their discomfited assailants were the poorer by seven thousand pounds.

In forty-two English and Welsh boroughs, the legally legitimate disbursements of the candidates exceeded five thousand pounds. More than twice that amount was spent in contesting York; in Southwark, the expenditure reached L.15,570; in Lambeth, it came to L.18,272; and Manchester was only won and lost at a cost to the contending parties of L.20,540. Six candidates for the suffrages of the 24,042 electors of the City of London expended L.13,507; nearly ten thousand pounds more than it cost to elicit the opinion of the 28,524 voters of Edinburgh, the exact expenditure there being L.3602; while Dublin, with 13,599 electors, extracted L.5711 from the pockets of its political wooers. Glasgow proved the costliest of the Scottish burghs, the election charges coming to L.14,584; Kilmarnock followed at a respectful distance with L.6072; Dundee and Ayr being the only other burghs in which the expenditure exceeded five thousand pounds. Belfast election cost L.11,174; that of Down County, L.12,170; and that of Antrim County, L.14,416. Argyllshire is the one Scotch county credited or discredited with costing aspirants for its representation above ten thousand pounds; thereby emulating the example of no fewer than thirty-three English and Welsh county constituencies.

In five of these thirty-three constituencies the expenditure amounted to more than twenty thousand pounds. In South Essex, L.20,057 was spent; in Montgomeryshire, L.20,091; in South Durham, L.22,088; in North Durham, L.23,923; and in South-east Lancashire, L.25,782. This being the largest sum set down in the record, it is well, perhaps, to note how the money went. Here are the items: Returning Officer's charges, L.1251, 19s. 4d.; agents, clerks, messengers, and canvassers, L.4592, 4s. 6d.; hire of conveyances, L.6148, 6s.; printing and advertising, L.9566, 11s. 10d.; all other expenses, L.1220. Total, L.25,782, 1s. 8d.

The Lancastrian bill of costs is no guide to the apportionment of expenditure in other places. Different agents, different notions. One will put his trust in volunteers; while another acts on the principle that if you want work done, you must pay for the doing. Mr Jones believes in the efficacy of oratory, and is all for public meetings, properly packed, of course. Mr Brown worries the electors with communications by post. Mr Robinson thinks it necessary to cover every available inch of wall with glaring posters, strong in the faith that the battle is to be won by out-billing the enemy; an expensive method this, especially if the enemy's agent is of the same opinion, when it proves more profitable to the printers than to the gentlemen who have to pay the piper.

In county contests, 'hire of conveyances' is necessarily a formidable item, since many voters have to be brought from far-distant homes; and it is nothing uncommon for two thousand pounds to be spent in that way. Some parliamentary aspirants would have held themselves fortunate in escaping so easily. In North Lancashire, it cost L.6135 to convey the electors to the poll; the candidates for

South Durham expending L.6536; and those for the northern division of that county, L.7330 for the same purpose. It was worse still in Montgomeryshire, a county registering but 5291 voters, for there the expenditure upon conveyances reached L.7819, the beaten candidate expending L.5828, 4s. 10d., or at the rate of L.2, 17s. for every supporter that found his way to the polling-booth. After this, the sums spent upon carriages and cabs in the borough elections seem moderate enough; but it is hard to understand why it should take L.3663, 16s. 2½d. to pay for conveyances at East Retford with an electoral roll of 8278, when the 63,398 voters of Birmingham could be sufficiently provided for by the expenditure of L.1480.

Sir George Elliot is credited with having paid most dearly for his seat, his disbursements amounting to L.12,726, 14s. 8d.; while Mr Whitworth is to be congratulated upon winning Drogheda without opposition, be it understood—at the cost of half a sovereign. Very different was the fate of Mr Wynn, who expended L.13,453 in vainly wooing Montgomeryshire; every vote he polled costing him L.6, 13s. 3½d. Sir W. A. Franklin's ten friends at Thirsk cost him just L.13, 19s. 6d. apiece; Mr Jones's five supporters at Droitwich represented the result of an expenditure in the salt town of L.73, 0s. 2d.; by spending L.521, 12s. 2d., Mr Malgarini obtained sixteen votes at Chester, at the rather exorbitant rate of L.32, 15s. per vote; an achievement capped by Mr Davis, whose nine Dundalk votes cost him L.37, 12s. 2d. each.

Here is the 'average cost per vote polled' by some of the more notable members of the legislature: Mr Gladstone, 1s. 4d. at Leeds—L.1, 14s. 1½d. at Millthorpe; Lord Hartington (N.E. Lancashire), 13s. 10d.; Sir William Harcourt (Oxford), 10s. 8d.; Mr Bright (Birmingham), 1s. 10d.; Mr Chamberlain, 2s. 1d.; Mr Forster (Bradford), 3s. 9d.; Mr Fawcett (Hackney), 10d.; Colonel Stanley (N. Lancashire), 14s. 3d.; Sir R. A. Cross (S.W. Lancashire), 9s. 8d.; Lord George Hamilton (Middlesex), 8s. 11d.; Mr Goschen (Ripon), L.1, 9s. 5d.; Lord Randolph Churchill (Woodstock), L.2, 4s. 2d.; Lord Elcho (Haddingtonshire), L.4, 13s. 9½d.; the last being the highest rate, with one exception, paid by any successful candidate at the late election. The exception is Mr Cameron, whose average cost per vote polled at the election for Inverness was L.1, 16s. 4d. Curiously enough, we must go to a Scotch constituency for the minimum too; for Mr Anderson came off victorious at Glasgow at an expense per vote of fivepence-halfpenny; his colleagues paying respectively 1s. 1½d. and 1s. 2½d.; while one defeated candidate's votes cost him 8s. 9½d. each, and the gentleman who was at the bottom of the poll paid 11s. 0½d. apiece for his 11,071 votes.

At the General Election of 1880, fifty-nine out of eighty-three English counties or divisions of counties were contested at a cost altogether of seven hundred and eighty-one thousand pounds; one hundred and seventy-four borough elections entailed an expenditure of six hundred and twenty-seven thousand pounds; the Welsh counties and boroughs extracted a hundred and one thousand pounds out of the pockets of politicians; the Scotch elections did the same to the extent of one hundred and ninety-eight thousand; while one hundred and four thousand pounds

were distributed among the Irish constituencies—making a total of one million eight hundred and eleven thousand pounds. To this something considerable must be added for the missing returns, and we shall be within the mark in setting down the costs of a General Election—the perfectly legal costs only—at the enormous sum of two million pounds sterling. What the actual cost is, one may guess, but no one will ever know.

## SELIS.

## IN TWO PARTS.—PART II.

TALKING of legerdemain, reminds me of a little incident I witnessed in a country town last winter. A conjurer who was giving an entertainment for a charitable purpose, was much hampered and annoyed during the course of his performance by a gentleman in the stalls, who continually raised frivolous objections, or sought to impose vexatious conditions, and who constantly favoured his neighbours with audible explanations of what was going forward, such as: 'Up his sleeve!' 'I saw that!' and remarks of a similar nature—one of those extraordinary individuals who actually pay their money for admission to an entertainment of this sort for the sole purpose, 'as it seems, of stopping it, if possible! Any fool can prevent a trick being done; but that is not quite the same thing as finding it out; and the nature of the objections raised by such gentry is generally found to be something similar to challenging a pianist, who has just executed a brilliant fantasia, to repeat the same standing on his head, or with the cover of the piano shut. The prestidigitator causes a sixpence to vanish from his fingers; they immediately want the same thing done with a four-post bedstead or some such trifle; and should he confess his inability to do so, they exclaim: 'Ah, no!' in a tone which not only might induce people to think they have discovered the secret, but which leads one to believe that some notion to that effect really exists in their own minds, or whatever it is that takes the place of mind in these unhappy persons.

I have seen Herrmann treat such a person capitally by bringing him up on the stage to assist him, and taking the rest of the audience into confidence while mystifying the person thoroughly. Thus, the confident amateur would be requested to draw a card from a pack, put it back, and shuffle. This he would do vigorously, to prevent the possibility of detection. Meanwhile, Herrmann, turning his back to the audience, would reveal to them the identical card in his hand. It had been adroitly removed in the act of passing the pack to be shuffled; and the idea of the volunteer assistant assiduously mixing the remaining fifty-one cards for nothing was irresistibly funny. But the suspicious of the determined-not-to-be-done amateur would now be aroused by the general laughter; and Herrmann, making a feint of throwing something under a handkerchief or behind a chair, would induce him to dart round in pursuit of it. The moment his victim turned, the card was stuck on his back with a minute pellet of beeswax in full view of every one. Nothing behind the chair; nothing under the handkerchief; nothing in the magician's hands, sleeves, or pockets. Pack carefully re-examined; card disappeared! 'Go and ask that

lady for it,' the Professor would say, indicating some one at the very back of the theatre; and hesitatingly, dubiously, watchfully suspicious ever, the now bitten biter would proceed thither, seeking in vain to account for the universal amusement at his expense. 'No; not that lady—the one on the other side!' And so, under these new sailing orders, he would be sent threading his way all over the theatre, fresh shouts of laughter arising *behind* him, whichever way he turned. Finally, Herrmann would direct him to some very little child, who would innocently find the card at once, amidst great applause—and the sold one was silenced for the remainder of the evening.

On another occasion, our conjurer adopted a different method. Biding his time, and submitting with apparent cheerfulness to much annoyance from a knowing youth, he came at length to the 'Mouchoir du diable' and other sleight-of-hand feats connected with handkerchiefs; and here he introduced the old trick of tying the handkerchief around the leg, and removing it under cover of another without unfastening the sealed knot. It was interpolated with a purpose, no doubt, for every schoolboy knows the secret of it—the handkerchief, though seemingly passed twice round the leg, is in reality simply hitched in a couple of folds behind—and the victim swallowed the bait readily. Everybody knew how *that* was done, he observed contemptuously.

'I beg your pardon, sir,' said the performer, who had not chosen to overhear previous remarks. 'Did you say you knew how it was done? This is the trick for which the elder Döbler received a valuable diamond ring from the Czar of Russia; and unless you are a connection of that potentate, I think you are hardly likely to be in possession of the secret. But I will repeat it for your especial benefit.' (Proceeding to do so.)

'Will you let me put it round your leg?' was the challenge.

'Certainly. Come up here.—Now, take the handkerchief yourself.'

A little staggered by this unexpected compliance, the doomed one began to examine the handkerchief minutely, testing its elasticity, and holding it up to the light.

'Oh, if you suspect the handkerchief, use your own by all means. It is a matter of indifference to me.'

Poor young man! How eagerly he caught at the offer, made the exchange, and knotted his own snowy cambric tightly around the Professor's knee! Then the knot was sealed in due course. 'There!' exclaimed the knowing one, with a glance full of confident triumph towards the audience. 'I will bet you a sovereign that you don't get *that* off without untying the knots or slipping it down over your foot.'

'Oh, I am here to conjure, not to bet,' replied the entertainer. 'Still, on this occasion, since you propose it, I don't mind wagering a sovereign with you, provided the rest of the company do not object to such a transaction, and the sovereign be applied to the funds of the Hospital in aid of which I am here to-night.'

Agreed *non. com.*

'The conditions are clearly stated and understood—are they not? I am to remove the handkerchief from my leg, leaving the knots and seal

intact, and keeping my foot fairly on the floor the whole time. You have tied and sealed it yourself, and will recognise your own unaltered knot and unbroken seal. Furthermore, the handkerchief is your own.'

'Yes; that is so,' said the unconscious wretch.

'Then,' replied the conjurer coolly, 'lend me your penknife or a pair of scissors, and I will speedily disencumber myself without breaking either knot or seal!'

A great forgery having been committed, whereby a bank was robbed of thirty thousand pounds, the culprit succeeded in getting safely out of England, and escaped to the Argentine Republic, where there was no extradition treaty. He was believed to have taken the whole of the plunder with him, as his wife—who was narrowly watched—certainly held no portion of it, and no letter addressed to him had passed through the post-office; so a private detective of great reputation was employed by the bank authorities to go out to the River Plate, and endeavour either to recover the money, or to lure the forger into a position where he might be captured. This detective was an educated man, and well fitted to carry out the *rôle* he assumed—that of Major R—, travelling for his health, and intending to pay a short visit to Buenos Ayres before proceeding to Valparaiso and Peru. Unlimited powers, official and unofficial, were conferred on him; he was supplied with letters of introduction to the leading people in the Republic; and of course there was to be no question of expense. Thus furnished, he set out.

On arrival in Buenos Ayres, he discovered that his man had gone some leagues up country. Following up the track, he found him living in apparent great poverty, employed as a shepherd by an English *estanciero*, to whom the would-be Major R— happened to have a letter of introduction. In this way, he had no difficulty in making acquaintance with his intended prey—gradually and casually, to avert suspicion. One day, he asked him openly whether his position in life had not been very different from that in which he found him, as his speech and manners were those of a gentleman; and after a little hesitation, the shepherd confessed that such was the case—presently telling a plausible tale of misfortunes in business, &c. Professing pity for him, the kind-hearted Major lent him money, and took him back into the city, where he entertained him at one of the best hotels as his guest, having mentioned to him confidentially that he wished to invest a considerable sum in land out there, and promising to install him as manager of the estate. All this time, the thief was supposed to be carrying the money hidden about his person; and it was to devise some strategy for obtaining this with certainty and safety, that the detective postponed the *dénouement* of the plot so long. At length, when he had excluded every other possible place of concealment, and seemed to have won the man's entire confidence, he went to the captain of the British man-of-war lying there, and revealed himself in his own character—for nobody, till then, had the least inkling of the truth—and together they arranged a very nice little trap. The officers of the gunboat were to give a grand picnic, followed by a dance on board; and all the best people in Buenos Ayres were invited—Major

R—and his friend among the rest. The 'friend' was delighted at the prospect, and drew largely on the Major for the wherewithal to present a befitting splendour of appearance on the eventful day. As they strolled down to the wharf together arm-in-arm, you may be sure that Major R's heart beat high with the triumph already in his grasp—one of the cleverest captures ever planned by an emissary of Scotland Yard. Hiring a boat, they soon arrived alongside the man-of-war, where the poop was already crowded with ladies.

'Jump up,' said the Major, as the gangway ladder was lowered: 'we're just in time.'

'Well, no, Mr G—,' returned the forger, calling the detective by his real name. 'I don't think I'll go on board; but I'll stay here in the boat and listen to the music, while you go up and dance!'

If the officer did not feel sold at that moment, no man ever did. The best of it was, the audacious robber had not one penny of his booty with him, and was much too wary to trust the post. Both he and his wife—who joined him soon afterwards—were obliged to work for their bread until the arrival of their governess—who had never been suspected of complicity—with the whole sum. But how he discovered his adversary, was never known.

By the way, this same detective is said to have had another 'sell' a few days later. He went on board the mail-steamer just come in from Brazil, as he thought he might obtain an English newspaper. If he got one, he certainly had plenty of time to read it; for the steamer happened to be in quarantine, and he had to undergo the horrors of seclusion at Ensenada for three weeks!

A well-known London diamond merchant went out to Brazil to buy precious stones, seeking them, naturally, not in the big cities, but at the smaller places along the coast. The local steamer to which he had trans-shipped was one day about to leave some out-of-the-way port—Maceio, I think—when an Indian came on board selling skins; he also displayed some little shining pebbles, which he did not seem to set much store by. The merchant—reputed to be one of the best judges of a stone in England—saw at a glance that they were small diamonds, and carelessly offered a few reis apiece for them, which the Indian gladly took; then, appearing to have thus discovered a new branch of commerce, he produced an immense one attached to a string around his neck—one so large and valuable, that the dealer, in his eagerness to obtain it, was thrown off his guard, and offered so much for it that the dusky possessor's suspicions were excited. When I say 'so much,' I do not suppose the sum was intrinsically great, perhaps not more than a shilling or two; but it was out of all proportion to what he had paid for the others. The Indian refused. More and more money was promised, and displayed before his eyes in glittering piles. Rum, knives, shawls, and all sorts of commodities were thrown in; but without avail. If the pale-face wants this bit of stone so much, he might be supposed to argue within his 'untutored mind,' it must be of some great power or value—perhaps an amulet or charm of supernatural virtue. Superstitious and obstinate, like all his race, he would not part with it on any terms; but hastened to

conceal it about him again, and hurried on shore. The merchant was frantic; such an opportunity was not to be allowed to slip without making some effort. He paid the fine—no inconsiderable sum—for detaining the steamer in port another day, and roamed all over the neighbourhood, searching high and low for the Indian. No glimpse of him, however, could he get, nor any tidings of his whereabouts. At last, on the following morning, when he had given up the quest in despair, and the vessel was again about to proceed on her way, the innocent savage made his appearance on board once more, and expressed his willingness to sell the diamond. But in the interval that had elapsed, he seemed to have discovered, from some unknown source of information, its actual worth, and he now asked for it a sum which would be a fair equivalent for a gem of that size. Nor would he take less, nor allow the stone to pass from his hands until he had received the money. The bargain was made; the gold-laden Indian paddled back to his native wilds; and the steamer getting under-way, soon left his canoe a mere speck on the waves.

After settling certain transactions on paper relative to his note-of-hand, which had just been cashed from the ship's chest, the happy purchaser sped to his cabin, locked himself in, sat down to gloat over his newly acquired treasure, and—report says—fainted. Paste! A good imitation, certainly, but to his practised eye, unmistakable paste. He had been misled by the genuineness of the small stones; and his eagerness to secure the large one for comparatively nothing, and utter absence of grounds for suspicion, had caused him to disregard the little opportunity he had for examining it. The whole thing was a most ingenious plot, devised by some Yankee swindlers, who, with the 'noble red man' as their ally, had been waiting for him ever since he arrived in Brazil; baiting their hook with a few real sprats, they landed a whale. When I told the story to some diamond dealers in London afterwards, they refused to believe that so experienced a man could be deceived by a sham. The story leaked out in quite another quarter, however, in a short time. It was not the excellence of the paste that had imposed on him, but the artful misdirection of the attention.

#### SOME CURIOUS FASHION FREAKS.

PROBABLY no human being has ever existed who at some time of his life has not felt some anxiety to heighten his beauty or hide his defects by his attire. Beauty may not need 'the foreign aid of ornament'; but from the poor savage with tattooed face and shell necklace, to the noble dame whose charms are enhanced by the flash of her diamonds and soft laces, the poet's advice has been practically scorned and disregarded. Every subject has its humorous side; and we select a few amusing instances of the ingenuity of both sexes in efforts to make themselves more lovely in each other's eyes.

The adoption of the fashionable *écru* colour in linen and lace has a parallel in the twelfth century. Isabella, daughter of Philip II., made a vow not to change her linen till Ostend was taken. Unfortunately, the siege lasted three years, a prolongation of time which did not possibly enter into the lady's head when her vow was

made; yet her character for veracity was so high that it was believed she kept her vow; hence the ladies adopted as the fashionable colour a yellowish dingy shade which they christened *l'Ischewan*.

The ladies of Greenland paint their faces green and yellow. It is not many years since that at the French court no lady was considered in full dress whose colour was not heightened by rouge. In ancient Persia, aquiline noses were much admired; and when there were rivals to the throne, other claims being equal, he who possessed the handsomest nose was proclaimed king. Consequently, noses were as much as possible moulded by art. If the Peruvian ladies wear rings in their noses, ours do in their ears, which according to the dictates of Fashion, either sweep the shoulder, or diminish to tiny pearls screwed against the ear. The tremendously piled-up coiffures of the reign of Queen Anne, or indeed of five years ago, are an imitation, certainly a cleaner one, of the head-dress of the inhabitants of Natal. They, we are told, wear caps, or bonnets, from six to ten inches high, of the stiff fat of oxen. They anoint the head with a purer grease, which mixed with the hair, serves to cement on the headgear which lasts for life!

A good excuse for wearing beards and moustaches is given by an author in 1640. He thinks they tend to make men valorous, and says: 'I have a favourable opinion of that young gentleman who is curious in fine moustaches. The time he employs in adjusting, dressing, and curling them is no lost time; for the more he contemplates them, the more his mind will cherish and be animated by masculine and courageous notions.' An old clergyman of the time of Elizabeth gives us a droll view of the *noblesse oblige* principle, when he says, in excuse for being proud of the longest and largest beard in the country round, that he lives 'that no act of his life might be unworthy of the gravity of his appearance.'

The wigs that used to be combed out with such grace by the young gallants of the last century, whether in a lady's drawing-room, at court, or in church, were most expensive adornments. Steele laments that even in his day they cost forty guineas. Mrs Thomas, the clever friend of Pope, mentions that her grandfather 'was very nice in the mode of that age, his valet being employed some hours every morning in starching his beard and curling his whiskers.' It is recorded that in the reign of Elizabeth—who seems equally to have patronised the follies of fashion and the wisdom of great men—two lovers sitting side by side could not take each other by the hand. The gentlemen then wore enormously stuffed-out doublets, and the ladies immense farthingales. That Elizabeth left three thousand dresses in her wardrobe is a fact well known; that she possessed a complete costume of every known country, may not be known so well. Her extravagance seems excessive; though in the reign of earlier kings, the passion for gorgeous apparel was equally great. Sir John Arundel, in the reign of Richard II., had fifty-two new suits of gold tissue alone. Fuller in his *Worthies* gives us a peep of the expense a priest of Queen Mary's time went to, that he might worthily honour his religion. In his will, he bequeaths to various parish churches and persons, 'my vestment of crimson satin, my vestment of

crimson velvet, my stole and fanon set with pearls, my black gown laced with taffata.'

About 1776 the ladies in England were in the habit of wearing immense head-dresses, made of hair, wool, wire, and feathers. Foote ridiculed it on the stage on one occasion in presence of the king and queen, his head-dress being one yard in width. It was so contrived that as he left the stage it fell bit by bit to pieces, causing great amusement. Her Majesty, who was noted for the smallness and good taste of her head-dresses, laughed very heartily at the exhibition. In a newspaper of that period, a humorous story is told of a lady in Covent Garden, who happening to look over her window whilst wearing one of these immense head-dresses, attracted the notice of the people below. Seeing this, she endeavoured to withdraw; but unfortunately the head-dress had caught on a nail in the upper part of the window, and extrication was for the time impossible, her position affording infinite diversion to the spectators. 'At length,' says the chronicler, 'by a violent jerk backwards, she withdrew her head only, docked of its enormous superstructure, which hung on the aforesaid nail for near an hour—to her no small mortification and confusion—a glaring monument of her fashionable folly.'

When the French nation reached its height of folly and wickedness, just before the Revolution broke out and flooded the land with misery and bloodshed, all who desired to be considered connected with the aristocracy carried about with them at least one *pantlin*. These were small wooden dolls, which by pulling a string, suddenly jerked out arms and legs; exactly like those which may be seen adorning the hats of 'swells' on a Derby day. The rage for them was immense. Nobles, gentlemen, and even grave ecclesiastics were to be seen carrying them about and playing with them. A somewhat similar rage for comfits existed in the reign of Henry III. of France. When the body of the Duc de Guise was found after the battle of Blois, he had his comfit-box in his hand.

In 1586 the ladies carried hand-mirrors attached to their châtelains, and, like Narcissus, were perpetually admiring their own charms. This excited the deepest indignation of Jean des Caures, a stern old moralist of the time, and he emphatically menaced them with the extremest penalties of the other world.

Who would have believed that so late as 1751 the dress of a dandy should have consisted of a black velvet coat, a green and silver waistcoat, yellow velvet breeches, and blue stockings! A satirical writer of about the same period gives a biting sketch of one of his contemporaries: 'A coat of light green, with sleeves too small for the arms, and buttons too big for the sleeves; a pair of Manchester fine stuff-breeches, without any money in the pockets; clouded silk stockings but no legs; a club of hair behind larger than the head that carries it; a hat of the size of a sixpence on a block not worth a farthing.' No doubt the same gentleman could paint a picture of the dress of our own time which would appear as ridiculous to the gentleman with the green coat as his own does to us.

## ISLAND LIFE.

IN looking at the distribution of animal and vegetable life over the various countries of the globe, the question of how the distribution has been effected must have occurred to many. So far as the larger divisions, or continents, of the globe are concerned, no particular difficulty at first sight presents itself; but in the case of the numerous *islands* that dot our larger seas and oceans, we at once find ourselves face to face with considerable perplexities. Take the case of the island of St Helena, for instance. It is situated in the South Atlantic Ocean, eleven hundred miles from the coast of Africa on the east, and eighteen hundred miles from that of South America on the west. When first discovered, nearly four hundred years ago, it was found to be densely covered with a luxuriant forest vegetation, which was afterwards almost entirely destroyed in various ways, not least by the ravages of goats bred from those which the Portuguese at first introduced on St Helena, and which in course of time overran it like a plague, leaving the island almost a desert. The destruction of the trees was also accompanied by the disappearance of many kinds of animals originally found on the island. Then take the case of the Azores in the North Atlantic, situated eight hundred miles from land—a group of islands extremely fertile, and abounding in animals of many kinds. In both these instances, which are only two among thousands, the question which presents itself to the scientific mind is: How did life, whether animal or vegetable, manage to reach these distant, solitary, ocean-girdled spots?

So long as men were content to believe that all the variety of life which we see around us was due to acts of 'special creation,' no serious difficulty was to be found in answering the question; but with a wider and more accurate knowledge of the wonderful processes of nature—of the remarkable operation of natural laws—it was at once found that to account for this distribution of animal and vegetable life on scientific grounds, a problem of

great delicacy and difficulty had to be encountered. The name of Mr Alfred Russell Wallace has long been distinguished in connection with the efforts that have been made to solve this problem, and his recent work on *Island Life* (London: Macmillan & Co.) is his latest and fullest contribution to the literature of the question.

Madagascar may be taken as typical of some of the difficulties of the question. This large island, containing three times the territory of England, presents an extraordinary instance of the anomalies in the distribution of animal life. It lies two hundred and fifty miles from the coast of Africa, and yet its mammalia differ entirely in all essential characteristics from the mammalia of the neighbouring continent. Madagascar possesses no less than sixty-six species of mammals which are not only different from those of Africa, but from those of any other existing continent. 'Africa is prominently characterised by its monkeys, apes, and baboons; by its lions, leopards, and hyenas; by its zebras, rhinoceroses, elephants, buffaloes, giraffes, and numerous species of antelopes. But no one of these animals, nor anything like them, is found in Madagascar.' Of the lemurs, there are six genera and thirty-three species on the island—half its entire mammalian population; and nowhere else are these creatures found in such abundance. Then the carnivora of the island are represented by a peculiar cat-like animal, *Cryptoprocta*, forming a distinct family, and having no allies in any part of the globe. In the rodents—the rats and mice—of the island, one genus is said to be allied to another which is indigenous to America; and the Colubrine snakes are represented in Madagascar, not by African or Asiatic genera, but by two American genera. Of the lizards of the island, certain of the genera are again found to be allied to families which are exclusively American.

These facts are very extraordinary, for they show us, that while few of the animals on the island are represented by African families, many others are represented among existing mammals only by families to be found in the far-distant

and utterly foreign continent of America. The explanation which Mr Wallace gives of this peculiar state of things appears to be a reasonable one—namely, that the island of Madagascar was at one time connected with, or formed part of, the continent of Africa, but, with its stock of mammals, was detached therefrom at a period long prior to the descent into Africa of the different race of animals which now inhabit that continent. Thus we have a collection of mammals existing on the island such as we may suppose to have inhabited Africa previous to the immigration of its present mammalia. These have almost completely obliterated all traces of their predecessors, for whom we must therefore now look to the piece of land which was detached from the continent while the older race of animals still inhabited it, and which now forms the great island of Madagascar.

But while islands offer the best subjects for the study of distribution, the continents nevertheless present many interesting phenomena. Mr Wallace tells us, for example, that when an Englishman travels by the nearest sea-route from Great Britain to Northern Japan, he passes by countries very unlike his own, both in aspect and natural productions. He skirts the sunny isles of the Mediterranean, the sands and date-palms of Egypt, the cocoa groves of Ceylon, and many other places, and after a circuitous journey of thirteen thousand miles finds himself in Japan. Yet what is his astonishment—after placing between him and England such enormous tracts of land, and with so little in them that is familiar to the English eye—to find himself once more in a country the natural objects of which are in many instances identical with those of his far-off home! Thus, 'he finds the woods and fields tenanted by tits, hedge-sparrows, wrens, wagtails, larks, red-breasts, thrushes, buntings, and house-sparrows; some absolutely identical with our own feathered friends, others so closely resembling them, that it requires a practical ornithologist to tell the difference. If he is fond of insects, he notices many butterflies and a host of beetles which, though on close examination they are found to be distinct from ours, are yet of the same general aspect, and seem just what might be expected in any part of Europe. There are also of course many birds and insects which are quite new and peculiar; but these are by no means so numerous or conspicuous as to remove the general impression of a wonderful resemblance between the productions of such remote islands as Britain and Yesso.'

On the other hand, if an inhabitant of Australia sails to New Zealand, a distance of less than thirteen hundred miles, he will find himself in a country whose productions are totally unlike those of his own. 'Kangaroos and wombats there are none, the birds are almost all entirely new, insects are very scarce, and quite unlike the handsome or strange Australian forms; while even the vegetation is all changed, and no gum-tree, or wattle, or grass-tree meets the traveller's eye.' But still more striking contrasts than these are to be met with. There are two islands in the Malay Archipelago, named Bali and Lombok, each about as large as Corsica, and separated by a narrow strait of but fifteen miles. 'Yet these islands differ far more from each other in their birds and quadrupeds than do England and Japan. The birds of

the one are extremely *unlike* those of the other, the difference being such as to strike even the most ordinary observer.' Such an instance is useful 'as proving that mere distance is one of the least important of the causes which have determined the likeness or unlikeness in the animals of different countries.'

Instances of a similar kind might be given from the western hemisphere; but the above are sufficient to indicate the nature of the problem with which the scientist has to deal in determining the laws and incidental causes that have to do with the phenomena of distribution. Many of the questions arising out of this problem are of singular complexity and interest; and even the solution which Mr Wallace's long experience of the subject enables him to attempt, may not in many points be accepted without considerable discussion in the scientific world.

One of the first things to note in considering the solution which our author advances, is, that the geographical divisions of the globe do not correspond to its zoological divisions. Thus the term 'Europe' does not give, with any approach to accuracy, the range of any one genus of mammals or birds. They may range into Siberia, or into Asia Minor, or Palestine, or North Africa. Consequently, for the purposes of the naturalist, the old geographical divisions are discarded, and a series of zoological divisions substituted. Thus Europe, with north temperate Africa and Asia, form what is called the Palearctic Region; Africa south of the Sahara, the Ethiopian Region; Tropical Asia, the Oriental; Australia, the Australian; North America, the Nearctic; and South America, the Neotropical Region. The various families of birds and mammals are not distributed over this region in any regular or continuous way; but are often discontinuous, and appear as it were in patches, to connect which, or to account for which, is one of the problems of distribution to be solved. Hence it is necessary to make some inquiry into the different powers of dispersal of animals and plants, into the nature of the barriers that limit their migrations, and into the character of the geological or climatal changes which have favoured or checked such migrations.

It is impossible within the limits of a magazine article to give any adequate idea of all that is involved in the elucidation of these important questions; though a few words may be said on the interesting subject of the dispersal of animals. As is readily conceived, a wide extent of ocean forms an almost insuperable barrier to the dispersal of all land animals, and even of birds; for, though the latter can fly far, yet they cannot go thousands of miles without rest or food, unless in the case of aquatic birds, who can find both rest and food on the surface of the ocean. Without artificial help, therefore, neither mammalia nor land-birds can pass over very wide oceans. 'The exact width they can pass over is not determined, but we have a few facts to guide us. Contrary to the common notion, pigs can swim very well, and have been known to swim over five or six miles of sea; and the wide distribution of pigs in the eastern hemisphere may be due to this power. It is almost certain, however, that they would never voluntarily swim away from their native land; and if carried out to sea by a flood, they would certainly endeavour to return to the shore. We cannot

therefore believe that they would ever swim over fifty or a hundred miles of sea; and the same may be said of all the large mammalia. Deer also swim well, but there is no reason to believe that they would venture out of sight of land.

'With the smaller, and especially with the arboreal mammalia, there is a much more effectual way of passing over the sea by means of floating trees, or those floating islands which are often found at the mouths of great rivers. Sir Charles Lyell describes such floating islands which were encountered among the Moluccas, on which trees and shrubs were growing on a stratum of soil which even formed a white beach round the margin of each raft. Among the Philippine Islands, similar rafts with trees growing on them have been seen after hurricanes; and it is easy to understand how, if the sea were tolerably calm, such a raft might be carried along by a current, aided by the wind acting on the trees, till after a passage of several weeks, it might arrive safely on the shores of some land hundreds of miles away from its starting-point. Such small animals as squirrels and mice might have been carried away on the trees which formed part of such a raft, and might thus colonise a new island; though, as it would require a pair of the same species to be carried away together, such accidents would no doubt be rare. Insects, however, and land-shells would almost certainly be abundant on such a raft or island; and in this way we may account for the wide dispersal of many species of both these groups.'

But such causes as these can scarcely be accepted as sufficient to account for the dispersal of mammalia as a whole; and whenever a considerable number of the mammals of two countries are found to exhibit distinct marks of relationship, Mr Wallace thinks we may be sure that an actual land connection, or at all events an approach to within a very few miles of each other, has at one time existed. A great number of identical families and genera are in fact to be found in all the great continents, and the present distribution of land renders it easy to see how this dispersal has been effected. All the great land masses radiate from the arctic regions as a common centre, the only break being at Behring's Strait, which is so shallow, that a rise of less than a thousand feet would form a broad isthmus connecting Asia and America. Continuity of land may therefore be said to be general over the globe; the chief exceptions to this being Australia and a number of large islands. These islands are divided into two classes—(1) those which have been formed in the ocean by volcanic or coralline agency; and (2) those which have simply been detached from continents by the sinking or submergence of the connecting land. On the first class of islands, the oceanic, there is no trace of indigenous mammalia or amphibia, but they usually contain an abundance of birds and insects, and a sprinkling of reptiles. Continental islands, on the other hand, are never far from land, and always contain some land mammals and amphibia, as well as representatives of other classes and orders. It is therefore suggested that all the animals and birds which inhabit the oceanic islands must have reached them by crossing the ocean; or they must be the descendants of ancestors who did so; and that those which inhabit islands adjacent to continents,

may partly have been left there when the separation from the mainland was effected.

But, in Mr Wallace's opinion, the key to the many difficulties which have hitherto prevented the student from forming a clear conception as to the way in which the distribution of life over the globe has been effected, is to be found in the permanency of land masses, and the evolution of species. Some of the author's views will, as already observed, provoke discussion; yet these views, if found to be right, will rank in the future as conclusions of primary importance. He holds, for instance, that in the main the great land and ocean areas of the present time have been permanent ever since the beginning of the geological record. The great ocean deeps have been stable; but the shallows and their associated land areas have been subject to incessant changes of level relatively to the surface of the sea, in consequence of the combined influences of upheaval, subsidence, and denudation. The result of this theory is, that while the same area may have been at one time sea, at another land, in frequent succession, yet the great land areas have always been approximately where they are now. Then as regards the effect of the evolution of species on the dispersal of animals, he considers he has established the fact that wild animals are by no means so constant in size and minor characteristics as has generally been assumed. In some extreme cases, it is found that the size of proportional parts may vary to the extent of twenty-five per cent.; and that in many cases it may be three, four, six, or nine per cent. These great variations, in conjunction with incessant climatic and other changes, are sufficient, in his opinion, to account for the present distribution of animals into zoological regions and districts.

So much for his general conclusions. But too much stress must not, as Mr Wallace points out, be laid on isolated causes. The phenomena of distribution cannot be adequately perceived if looked at from a specialised point of view; since every fact is but a link in a great connected series of changes, the beginning of which is to be found in ages long since gone by, and the continuation of which will stretch into the distant future. It is a singularly complicated and difficult question, yet presents points of immense interest to students of nature, who, whether they should or should not agree with Mr Wallace's conclusions, will not rise from the perusal of his book without a deep impression of the masterly way in which he has treated a subject at once so wide and so complex.

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER XXVIII.—THE RESCUE.

THE moon was young, the night was dark, and the ebb-tide, aided by a brisk westerly wind, went rushing furiously down. The boats, which, under Bertram's leadership, had pushed out into mid-stream from the slimy stairs below the *Shipwrights' Arms*, went fast too, strong backs bending to the oars, strong arms waiting, idle. Along the lower reaches of the Thames, everybody who lives anyhow, by the water and the keels that ride upon it, can row a bit, as the saying is. But the rowing on this occasion was more vigorous than skilful, the boats yawed in a manner that wasted time and

toil, and it was not easy to avoid awkward contact with vessels at anchor. 'Ahoy, ahoy, ho there!' rang out the hoarse hail from aboard a South Shields or Newcastle collier, as they passed. 'Boats, ahoy!'

'What cheer?' inquired the big shipwright who pulled the stroke-oar in Bertram's boat, whose designation in the Yard was Long Tom, and who had been the first to volunteer.

'I'm Cap'en of this brig,' responded the interlocutor, a large man in red flannel shirt and Guernsey blue suit, as he leaned over the grimy gangway; 'and I've noticed something is wrong with the *Golden Gate*—the new full-rigged clipper a cable's length away. She's slipped her moorings, and gone down with the tide, and I heard a row on board, and cries of "Murder!" and "Help!"'

'Just as I feared!' exclaimed Bertram excitedly. 'Thank you, Captain.—Give way, lads!' And off went the boats, the oars quivering as the men put their strength into the stroke. It was needful to steer carefully, for half-a-dozen clumsy coal-hoys and red-sailed lighters were moored in the track, and when the boats gained clear water it was evident that the *Golden Gate* was gone from her anchorage. There were the tall masts dimly visible, afar off.

'She's rounding into Bully's Reach,' cried a waterman, as he espied the drifting vessel, 'and she'll ground on Drowned Point, I bet a hundred.'

'Pull, men, and pull with a will!' exclaimed Bertram, as he gathered up the tiller lines, and steered his best. Round went the three boats into Bully's Reach, Bertram's leading, just as the tall ship broached to on a half-sunken tongue of land—Drowned Point, no doubt. There were carts visible on shore. The rescuers could even hear the stamping of the horses and the cracking of the drivers' whips. Three or four small boats were buzzing around the ship, like flies around a slaughtered animal. Plainly, the robbers were eager to make sure of their booty.

'Hurrah!' shouted the sturdy wrights, on catching sight of the enemy. It was impolitic, but it was British; it was a manly impulse that prompted the cheer, which Bertram could not check. Frenchmen, I am afraid, under the same circumstances would neither have cheered nor fought. It takes a great idea, or a dribble of money at stake, to make the modern Gaul exert himself. But these Thames shipwrights came on to the fight, as if fighting were sport.

'Hurrah! We'll trim their jerkins! Col'ar hold of her with the boat-hook!' bawled Long Tom, who was presumably a Kentish man, and talked the dialect of the land of hops and cherries.

'Landsharks!'—'Ware!'—'Rouse!'—'Knock their brains out!' were the responsive cries on board the stranded ship. There were hard knocks and fierce resistance as the shipwrights forced their way up the ship's side, holding on to chain and rope, scrambling and avoiding as best they might the blows that were aimed at them from the deck. Bertram, who was among the foremost boarders, received a heavy blow or two, and might have got a fatal stab from the drawn 'snickersnee' of grim Captain Jack, whose wicked eyes shone brighter than the knife-blade, had not Long Tom the shipwright wrenched the weapon out of the

old river pirate's gnarled hand. But the struggle was yet uncertain when the galley of the Thames Police dashed up, and there were daring men and glittering cutlasses swarming over the ship's bows; and the rogues who had been busy, with bag and hatchet, among cabins and storerooms of the new clipper, fled breathlessly, and the carts started at a gallop, and all was rout and dismay.

'One, two, four, six prisoners,' said the business-like Superintendent of the Thames Police; 'but one of them is Captain Jack.'

Captain Jack, with Long Tom's knee pressing on his deep chest, as he lay on the deck, answered by a curse. No chieftain of a Red Indian tribe, Comanche or Sioux, captured by the white men, could have been more stubborn than this obstinate desperado. He hardly knew, as he lay, gasping but unconquered, whether to swear the most at his late confederates or at his captors; so he swore roundly at both. 'A lot of helpless duffers!' 'Malingering lubbers that couldn't look a cow in the face!' such were the mildest terms in which he described his associates; while he branded the police as 'white-livered sons of sea-cooks that durstn't—no, they durstn't,' perhaps missing the kicks and cuffs which, half a century ago, were wont to lend zest to a caption.

'Clap the darbies on him! Put the bracelets on the kit of them!' said the Superintendent at last; and the touch of the steel handcuffs seemed to produce a sobering effect on the old man, and on the five scowling or snivelling knaves who were also in custody. Some mischief had been done, but not much. Black Juba lay at the entrance of his cook's galley, bleeding and stunned; while Trencard the ex-man-of-war's man, and the two boys, were found in the fore-castle, roughly handled, but not seriously hurt, and with pieces of ratline tightly knotted round their galled wrists. Mr Swaine the storekeeper, who had hidden himself at the first alarm, was ignominiously unearched in the bread-room, and prayed Bertram and the others, whom he took for pirates, to spare the life of the father of a family.

Not much had been spoiled—nothing, or next to nothing, carried off. A hundred pounds, or at the outside, two, might pay for silk and gold and brass hacked away, or ripped off with the knife, for doors smashed, and stores purloined. But Juba the black, whose head was fortunately of average negro thickness, and whom a jorum of rum-and-water, and a little rough kindness, greatly revived, had really been severely maltreated; and Bertram himself had a cut on the forehead and a bruised wrist, while most of the men had sustained contusions or other hurts.

'Still, hurrah for our side!' shouted Long Tom the wright in triumph, though the blood trickled down his face as he said it, and every good fellow on the honest men's side joined in the cheer that floated far over the desolate Essex flats and the Kentish marsh opposite. Perhaps the happiest person present was the shrewd Superintendent of the Thames Police, as, with the prisoners, ironed, and hustled into the thwarts and stern-sheets, he bade his crew row back to the station stairs. He had broken up a formidable gang. He had saved property, and life perhaps. Although Parliament was sitting, the morning papers would find room for some praise for the zealous and able chief of the

civil force that had captured Captain Jack. But even in his cup of bliss there was a drop of gall. The gamekeeper who has trapped the pheasant-eating fox, the French *garde forestier* who has shot the wary wolf so long the terror of the fold, feels a sort of regret as he pockets his reward. Where shall he get another wolf, or discover a fresh fox? With the conviction of the aged pirate, the Superintendent felt that he was parting with the last element of romance in his profession.

Then a guard was set. It would need tugs, and steam, and tow-ropes, and cables, to bring the clipper back next day to her anchorage; but in the meantime it scarcely required the presence of the men who stayed on board, or the glow of lamps and fires to scare away the thieves, already scared, who in far-off squalid dens were bewailing the overthrow of the promising project which young Bertram had spoiled.

CHAPTER XXIX.—PROMOTION.

Those were pleasant days, pleasant weeks, which succeeded Bertram's exploit of the relaking of the *Golden Gate*. That grand ship had spread her acres of snowy sail, and on them been wafted over endless seas to far-off Anstralia. But Mr Mervyn remained, and so did kind, frank Mr Arthur Lynn, and so did the rough shipwrights to whom the young man, their leader, was a hero. Bertram never forgot how his cheeks had tingled with manly shame when Mr Mervyn, his employer, had given him public thanks, and public praise, before all the clerks and workmen; or the cheering; or Arthur's friendly pressure of the hand. They had offered him no money, and he was glad of that, though pecuniary rewards had been liberally dealt out among the rugged wrights who had fought to protect the property of Mervyn & Co. But Mr Mervyn had hinted at promotion, less as a boon than as a well-earned recompense; nor was it long before the promotion came.

One fine evening in the early summer, when there were seas of May-bloom on the aged hawthorns—Queen Elizabeth's hawthorns—in the so-called Happy Valley of that royal Park of Greenwich where once monarchs aimed the arrow, and spurred the steed, to the detriment of the dappled deer, Bertram was returning from a solitary ramble under the leafy shades of the spreading Spanish chestnut trees, when his way led him past the colonnades and lawns and stately roofs of that Naval Hospital which was once a palace, and is now an anomaly, and past the great Greenwich hosteleries which overlook the Thames, and where whitebait dinners, ministerial, municipal, or private, are still solemnly eaten. There was a drag at the door—there were two drags at the door, whether of the orthodox *Crown and Sceptre* or of the more glittering *Trafalgar* matters not, no unusual sight on an evening in the latter part of June. Many Londoners, who have the means and the leisure, prefer to go on wheels, as in the days when macadamised roads were a wonder of the world, to suburban pleasure-resorts, instead of being dependent on the snorting steam-horse. These two four-in-hand carriages were not, it may be conjectured, the private property of any members of the British aristocracy chronicled by Burke and Debrett. There was silver-mounted harness that glittered and rattled as the sleek-coated horses

tossed their heads and champed their bits, and some flaring device of mock-heraldry was emblazoned on the panels; but the whole equipage had a coarse, flashy air, and the behaviour of the leering helpers who held the vicious-eyed horses by the bridle, or rubbed hissing at the gleaming lamps and burnished door-handles, was barely respectful. Hotel servants can generally form a tolerably correct estimate of their masters' customers. As Bertram lingered, the party of revellers came out, young men mostly, in evening costume, with flashing studs and spotless shirt-fronts and flushed faces, and voices thick with wine and foolish talk, laughing as they came. Among them were seniors, with dyed hair and moustache, or purple whiskers looming large, hollow-eyed, cruel and keen, hawks among the pigeons. Foremost of all was one whom Bertram fancied that he knew.

Nat Lee—the vagabond of the ditch—the bruised and plundered welsher, who had been thankful, last year, to lean on Bertram's arm, and to sip brandy that Bertram paid for—the former denizen of Rundle's Hotel, Limbo Street, Piccadilly—could this be Nat Lee? A distinguished gentleman, it would seem, well dressed, perfumed, and with a self-confident bearing that just stopped short of vulgar swagger. It was easy to see, by the deference which the others paid him, and by the air of assurance with which he gave orders, that he was the lion of the party. Showering small silver about him with a lavishness which procured him many a 'Luck to your honour!' and 'Thank ye, my lord!' from the hangers-on of the hotel, he climbed to the box-seat of one of the two drags, and gathered up the reins in his gloved hand.

'Are you all right there?' he called out. It certainly was the voice, as well as the face, of Nat Lee.

'No, no!' cried another voice, in answer, the voice of a foolish-faced, florid young man, whom any Jew, or any waiter in Christendom, would have accurately classed as a patrician, and none the less as a dolt. 'Wait for me, Fitzgerald, I only want another cigar, old man.'

Fitzgerald! Could that resounding patronymic be the lawful property of the man who had once been a clerk in the Dulchester Bank, and whom Bertram identified with his former disreputable roadside acquaintance. Lee, or Fitzgerald, whichever he was, caught Bertram's eye, changed colour, and turned away. 'Look sharp!' he cried, as his young friend clambered to his perch on the roof; and then, with a savage stroke of the whip and jerk of the reins, drove off.

As Bertram crossed in the ferry-boat to Blackwall, his mind dwelt, in spite of himself, on his recent encounter with one who was, he felt convinced, no other than the wayside vagabond whom he had found in evil plight in the ditch. There are ups as well as downs in the careers of adventurers as bold and shrewd as Nat Lee, and even his assumption of an aristocratic surname was not, after a minute's reflection, as unaccountable to Bertram as it had seemed at the first. There are silly lads among the golden youth of London, as of Paris or Vienna, ready enough to accept the sparkling counterfeit for sterling coin, on race-course and in billiard or card room, so long as champagne flows and laughter rings, and

who reverence knowledge of the world, according to their narrow ethics, beyond all earthly gifts.

Had this man, Bertram asked himself, any connection with the misfortunes of his early benefactor, good Dr Denham—anything to link him with Uncle Walter, the hard, polished virtuoso of Kensington? Certainly, this Nat Lee, if such were his name, had spoken of himself, and of the Old Bank at Dulchester, as though his former doings there had left an indelible impression upon his mind. Certainly, too, he had made bitter mention, grinding his teeth resentfully the while, of some enemy who should, in default of black-mail, pay in person or in reputation for the wrong he had done. But it was faulty logic, so Bertram felt, to identify this nameless enemy with Mr Walter Denham; and even granting that his scampish acquaintance had treasured up some grudge, after all these years, against the younger son of his old master, that by no means implied that Nat Lee had anything to tell, the telling of which would benefit the doctor's orphaned daughters.

As the ferry-boat crossed from the Kentish side of Thames to the bleak flats of the Essex shore, Bertram's gaze turned instinctively to the spot where, not many weeks since, the *Golden Gate* had lain at anchor. It seemed but yesterday that the attack upon the fine new ship had been followed by the defeat of the marauders. Already—for Metropolitan prisoners do not now languish before trial, as did the late Mrs Brownrigg of ogreish memory, according to the *Anti-Jacobin*—Captain Jack had been sentenced to a lengthy term of penal servitude, well deserved, and sundry of his accomplices to minor degrees of the same punishment. Bertram could still see the hardened face of the incorrigible old sinner, as he stood scowling in the dock, and remembered the defiant 'Thank ye, my lord—that won't hurt me!' with which this veteran foe to social order had received the judicial doom. The judge had praised Bertram in open court for his bravery and devotion; and the spectators then, and the newspapers afterwards, had echoed the praise. It seemed quite an old story now, although it had happened so recently.

When Bertram reached his lodging he was surprised to find his employer's nephew, Arthur Lynn, there, and waiting for him.

'No, there's nothing wrong,' said the good-natured young man, laughing at Bertram's anxious looks. 'Quite the contrary. My news to-night is good news, or I shouldn't have been in such a hurry to bring it to you, myself. You see, Bertram, that my uncle and I have been planning for you a little surprise—that's all.'

'A surprise—Mr Arthur—for me!' echoed Bertram, scarcely able to believe his ears.

'Why, yes,' replied Arthur Lynn, who had seated himself on the narrow window-sill, and was swinging himself backwards and forwards with an air of simple-hearted enjoyment. 'You surely did not think that Mr Mervyn and I imagined we had wiped out the debt of gratitude we owed you for your conduct the other night, by the cheap payment of a hand-shake and a few words of thanks? We at any rate'—

'There was no debt—nothing due—and the gratitude, dear sir, was all on my side,' burst in Bertram eagerly, and flushing crimson. 'What

do I not owe to you—I, who was a homeless lad, almost a beggar, when you took me in and gave me what I craved for, the opportunity to work and be useful! It is your kind heart, Mr Arthur, that exaggerates the little I did—my plain duty.'

'It is your noble spirit, my lad, as my uncle said this very day, that leads you to make light of your own courage and sense and prudence,' answered Arthur Lynn, shaking his head. 'However, Bertram, we acknowledge our obligation to you, and mean to prove it otherwise than by mere compliments. I did not know that a vacancy would occur so soon; but—You are aware that we have a branch building Yard, for yachts chiefly, and steam-vessels in which speed signifies more than stowage, at Southampton, are you not?'

Yes, Bertram knew that.

'Mr Weston is the manager of the Yard, and has been so these fifteen years. He is an able agent, and an experienced one; but he cannot attend to everything single-handed, and with one pair of eyes to rely upon, especially as we are extending the business, and shall instantly send down a fresh batch of shipwrights, with Long Tom for their foreman. We want an Assistant Manager, too. Can you guess whom we have picked out for the post?' said Arthur Lynn; 'and if so, will you accept it?'

'You are too generous to me, Mr Arthur,' said Bertram, almost sobbing. 'How can I thank'—

'Only go on as well as you have done before, that's all, and it will be our good fortune to have put the right man in the right place,' interrupted Arthur, catching up his hat. 'These papers—see, I will leave them on the table—will give you an idea of your duties, the salary, and so forth; and on Wednesday, at latest, you should arrange to start for Southampton.—By Jove, I shall lose the train! Good-night!'

And Bertram was left alone. Strange, that when the first surprise of the good news had calmed itself, the image of Rose Denham should float before his mental vision. 'I shall meet her there,' he thought.

#### A DAY OR TWO IN THE ISLE OF MAN.

THE Isle of Man possesses few rivals as a field of operation for the hardy pedestrian not afraid to risk the traditional horrors of a few hours' sea-voyage. Pure bracing air, beauty and variety of both inland and coast scenery—the former of course on a small scale—and a curious feeling of remoteness, which brings a delicious sense of relief for a time from the cares and labours of a busy world, combine to render this quaint little island the very place for a ten days' walking tour. It must be frankly confessed, however, that by fastidious persons a drawback to the island as a place of resort may be found in the great number of visitors who overrun its towns every summer. But to those who do not mind coming in occasional contact with such, the island will be found to be a most agreeable spot in which to spend a holiday.

Little is definitely known about the early history of the Isle of Man. The people are of Celtic origin, the Manx language having strong affinities

with the Irish and the Gaelic of the Highlands. The island was long under the rule of the Earls of Derby, from whom it passed by succession to the Dukes of Athole, and it was not till 1829 that the Crown obtained full possession of it, by the purchase of the rights and privileges of the latter family. It has never been represented in the Imperial Parliament, but possesses an independent form of government, to which it adheres with the utmost tenacity. The executive power lies in the Governor, who is appointed by the Crown. The Parliament, or as it is called, the Court of Tynwald, consists of the Governor and Council, forming the upper, and the House of Keys, forming the lower house. In 1866 a reform bill was passed, enfranchising the people who elect the members of the House of Keys, a general election taking place every seven years. Justice is administered by two Deemsters, or judges appointed by the Crown, and by the High Bailiffs of Douglas, Ramsey, Castletown, and Peel. The tax-gatherer and the rate-collector are almost unknown in the Isle of Man. There is neither income-tax nor poor-rate, and only in the towns is there any local rate, and that but a small one.

The best view of Douglas Bay, which is the natural approach to the Isle of Man, is obtained when nearing the island from Liverpool; the whole outline of the coast, with its variations of light and shade, its green hills, its dark cliffs, and its rocky headlands, here appearing to advantage. The first object that strikes the eye is Maughold Head, a bold promontory, forming the north-eastern point of the island, and which seems to start up suddenly from the water's edge; while behind it, the summits of Snaefell and North Barrule, the two highest mountains on the island, rise gradually into view. Towards the north, the coast is bold and precipitous, with lofty cliffs, that dip sheer down into the water, divided here and there by deep gullies, through which the mountain streams find their way to the sea. Southwards, the high lands shelve gradually down, till at Castletown the country is quite flat. From this point the land rises once more, till its rugged coast-line terminates in the Calf, a huge mass of isolated rock, separated from the rest of the island by a gully or channel some five hundred yards in width.

The town of Douglas is a curious mixture of the old and the new. The old part, which is chiefly confined to the vicinity of the quay and harbour, reminds one of Dieppe, with its narrow tortuous alleys, its quaint old market-place, and its all-pervading odour of fish. The only building in Douglas which has any pretensions to architectural beauty or historic interest is Castle Mona, the ancient residence of the Dukes of Athole when they were lords of Man. It is an imposing-looking building of massive limestone, and stands in a commanding position on the margin of the bay; but it too has yielded to modern necessities, and has been transformed into an hotel.

But as it is not in the town of Douglas that the chief beauties of the Isle of Man are to be seen, we must seek for the charms of Mona elsewhere. A walk across the island from Douglas to Peel—a distance of some ten or twelve miles—will give the traveller a good idea of the prevailing characteristics of the inland scenery. The road is for the most part a level one, running through the valleys of the Glas and the Neb, streams which

can hardly be dignified by the name of river, being the exact counterpart of Tennyson's 'Brook.' If not the 'grayling,' at all events the 'lusty trout' may be found here, and will constitute an additional element of attraction to the angler. Indeed, a good day's sport may be had on any of the chief streams of the island, the best of which perhaps are the Sulby river and the stream running through Glen Rushen. Trees are not plentiful on the Peel Road or elsewhere; but the green hills which bound the valleys on either side attract the eye of the pedestrian by their variations of shade and colour, and the picturesque form of their outlines. Midway between Douglas and Peel, the road skirts the base of the mountain of Greeba—a hill which, as regards the Isle of Man, is the centre of the earth, and whence, on a fine day, England, Wales, Scotland, and Ireland may be clearly descried. Near to it stands the chapel of St Ninian, a ruin with a curious legend attached, which may perhaps be cited as a good example of the folk-lore in which the Manx people delight. Tradition says that the completion of the chapel was hindered by an evil spirit, or to give it its vernacular name, a *buggane*. The fiend apparently did not object to the construction of the walls; but whenever an attempt was made to cover in the building, he either carried off the roof bodily, or smashed it in by supernatural force. Anyhow, the chapel never was completed, and remains without a roof to this day, though perhaps the sceptic will not find it difficult to account for this phenomenon without having recourse to supernatural agencies.

At St John's, about three miles on the Douglas side of Peel, is Tynwald Hill, an artificial mound some eighty feet in diameter, and about twelve feet in height. Here, on the 5th of July each year, are promulgated all the laws that have been passed by the Manx Parliament during the preceding twelve months. The ceremony, which is somewhat imposing, is made the occasion of a great gathering of people from all parts of the island. The Governor, the Deemsters, the Coroners, and the other chief officials attend service in the chapel of St John, and then walk in grand procession to Tynwald Hill. Here they take up their positions, and the laws are proclaimed with due solemnity, the people meanwhile standing in a circle round the mount. This custom is said to date back more than a thousand years, and, as the Manx people are intensely conservative, may not improbably last a thousand more. The rest of the day is given up to merrymaking and the business of the fair, which is always held at St John's on Tynwald Day.

Peel itself is nothing more than a prosperous fishing village, and is chiefly remarkable for the ruins of its celebrated castle. Every one who has read *Peveril of the Peak* must be familiar with Sir Walter Scott's wonderfully accurate and graphic description of this famous stronghold, which he never saw. Standing some fifty yards from the land, on a rugged island, which is in reality the spur of a ridge of rocky hills gradually shelving down to the shore, Peel Castle cannot be surpassed for romance and picturesqueness of situation. Formerly, an almost impregnable fortress, owing to the massiveness of its walls and the strength of its position, for the last hundred years it has been nothing more than a beautiful ruin,

the red sandstone of which it is built having crumbled away under the fury of the storms to which it has been exposed for many centuries. Waldron's description of Peel Castle, as it appeared at the beginning of last century, is exceedingly quaint and interesting, though not a few of his statements might challenge comparison with some of the wondrous stories to be found in the pages of Sir John Mandeville. He says: 'This castle, for its situation, antiquity, strength, and beauty, might justly come in for one of the wonders of the world. Art and Nature seem to have vied with each other in the model, nor ought the most minute particular to escape observation. . . . Being entered, you find yourself in a wide plain, in the midst of which stands the castle, encompassed by four churches, three of which time has so much decayed, that there is little remaining besides the walls, and some few tombs, which seem to have been erected with so much care as to perpetuate the memory of those buried in them till the final dissolution of all things. The fourth is kept a little better in repair; but not so much for its own sake, though it has been the most magnificent of them all, as for a chapel within it, which is appropriated to the use of the bishop, and has under it a prison, or rather dungeon, for those offenders who are so miserable as to incur the spiritual censure. This is certainly one of the most dreadful places that imagination can form. The sea runs under it, through the hollows of the rock, with such a continual roar, that you would think it were every moment breaking in upon you; and over it are the vaults for burying the dead. Within it are thirteen pillars, on which the whole chapel is supported. They have a superstition that whatsoever stranger goes to see this cavern out of curiosity, and omits to count the pillars, shall do something to occasion being confined there.'

Peel Castle is now merely a romantic pile of ruins. Two of the chapels mentioned by Waldron, still remain, dedicated respectively to St German and St Patrick. The former, indeed, is still the cathedral of the diocese of Sodor and Man; for although it has long been in a dilapidated condition, it has never yet been replaced by another, and open-air services are held amongst the ruins during the summer months. A few interesting inscriptions may still be deciphered on the tombstones in this chapel; though of the diversities of tongues mentioned by Waldron, not more than two or three can be traced at the present day. The most curious of these epitaphs is one to the memory of Samuel Rutter, formerly Bishop of the diocese, who was buried here in 1663. It is in Latin, composed by the good prelate himself, who invites those who visit his tomb to be merry at the expense of the smallness and gloom of the episcopal residence. The consecrated portion of the castle was used as a burying-ground by the inhabitants of Peel till a comparatively recent date. The story goes that a whole funeral cortège was one day engulfed during their transit to the cathedral while a violent storm was raging; and the horror inspired by this circumstance stimulated the townspeople to provide a suitable cemetery on the mainland. On the top of a hill overlooking the sea near Peel Castle, is a remarkable burying-place in the form of a tower, bearing the suggestive name of 'Corrin's Folly.' This Corrin is said to

have been a rigid Dissenter, and wishing to show his utter disregard of the prejudice in favour of burial in consecrated ground, constructed this strange mausoleum for himself and his family.

The walk across the mountains from Peel to Port Erin is one of the grandest in the island. The coast is bold and rocky, indented by frowning headlands and precipitous gullies. The views of the sea and cliffs on the one hand, and of the mountains and glens on the other, are exceedingly fine, and gain by contrast with each other. But of all the majestic and precipitous headlands to be found in the Isle of Man, Spanish Head, the most southerly point, is the grandest. It rises straight out of the sea to a height of more than three hundred feet, pierced by numerous chasms, which bear evident traces of a volcanic origin. It derives its name from the fact that several of the ships of the Spanish Armada were dashed to pieces here in the awful storm which proved England's best ally. Opposite Spanish Head is the Calf of Man, a rocky island, some five miles in circumference, but containing very little cultivated ground. It is, in fact, a mere pile of lofty crags, some five hundred feet high, inhabited only by rabbits and sea-fowl. The Sound which separates the Calf from the mainland is full of dangerous currents; and the iron-bound coast in this neighbourhood has been the scene of many a fearful wreck. Perched high up on Spanish Head lies the village of Craigneesh, a primitive little spot, inhabited by the most primitive and conservative of folk, who pride themselves on being the real aborigines of the island. They neither marry nor give in marriage outside of their own circle, and hold themselves as much aloof from the rest of the world as is possible in these days. Inability to speak English is with them considered an accomplishment, though, happily, the progress of education is daily more and more restricting this accomplishment to the elders of the community.

About four miles to the north-east is Castletown, the ancient capital of the island. It still retains the nominal distinction of being the metropolis, though the seat of government has been virtually transferred to Douglas. Castle Rushen, to which the town owes its name, is the chief fortress of the island, and is said to have been built by Guttred the Dane, a son of King Orry, the great King of Man, about the middle of the tenth century. Its walls are of immense thickness, in some places not less than twelve feet; and time has so solidified the mortar used in cementing the huge blocks of limestone, that it is now as hard as the stone itself. The walk from Douglas to Peel and Port Erin, and back again by Castletown, embraces the southern half of the island, which is in many respects the most interesting. A first-rate walker might manage it all in one day; but he would undoubtedly miss a good deal by hurrying over it. To enjoy the scenery thoroughly, at least two days would be required; and three or four might be spent pleasantly enough on the way.

The walk from Douglas to Ramsey—the chief town in the north of the island—is for the most part within sight of the sea; indeed, in some places the road is hewn out of the solid mass of an overhanging cliff, like the famous Axenstrasse on the Lake of Uri. Ramsey itself is the largest town after Douglas, but is considered more select

and aristocratic than the latter. Exceedingly good fishing may be had in the bay, which is open and unprotected, and will not bear comparison with Douglas Bay, or some of the smaller ones in the south of the island. But trees flourish better here than in the south; and the beauty of Ramsey lies in the wooded heights that rise above the town, and form a most picturesque background to the view as seen from the middle of the bay.

There are not a few other places in the Isle of Man which the traveller with time at his disposal should by no means omit to visit. Foremost among these is Injebreck, a lovely spot, which recalls Moore's description of the vale of Avoca in *The Meeting of the Waters*. 'The soft magic of streamlet and hill' casts its spell over the mind of the spectator as he watches the streams of East and West Baldwin mingle their waters under the shadow of the lofty peaks that tower up on either side; and the traveller from town will feel grateful that he is privileged for a short time to tread 'the cool sequestered vale of life' apart from the busy haunts of men.

## THE FAMILY DIAMONDS.

### CHAPTER I.

'THEY are worth several lacs of rupees.'

I had no very clear idea what was the exact value of a lac of rupees, when I answered Cousin Martha as to the supposed value of Aunt Purpose's diamonds. I knew, however, that it represented a large sum; and then, I did not care to confess an absolute ignorance on the subject, especially to Martha, who is quite two years my junior, although a good many say that she looks the older of the two. We were sitting in my little four-roomed cottage before the open casement, and with my small brown delf teapot between us, were refreshing ourselves with an early cup of tea. Although we are both unmarried, yet we prefer occupying separate tenements, the Misses being too captious and domineering in disposition to agree well together. We are decidedly non-gregarious. Hence, we live apart, and have everything to ourselves. There were but three born Misses living—Aunt Purpose being one by marriage only—Patience (that is, myself); Martha; and Robert, a grasping, avaricious old bachelor. I know that it is not nice to detract one's relative; but Martha perfectly agrees with me in my estimate of our mutual cousin's character; therefore I think I may be allowed to record it. The last generation of Misses consisted of four brothers, the eldest of whom was Robert's father; the next, mine; the third, Martha's; while the fourth, who died childless, had been the husband of Aunt Purpose.

We of the younger generation had long been settled in our parents' native village of Nettlethorpe, happy, to a certain extent, in our mutual carpings and bickerings; when a great excitement was imported into the even tenor of our lives by the news that Thomson—the local house-agent—had been written to by Aunt Purpose, authorising him to take, in her name, a moderately sized house in our primitive little hamlet.

Now, one word about Aunt Purpose. Uncle Job, her husband, had held an official appointment in the East Indies, where he had met and

married her. Nothing was heard of them for some years; and then news arrived of his death. Again an interval of silence occurred, to be broken by the intelligence that our widowed relative, whom we had never seen, was about to come and live in the midst of us, actuated thereto by a wish to end her days amongst her husband's kindred, as she had none of her own. The fact of her being a stranger to us, would have been sufficient to have awakened a certain amount of interest in her arrival; therefore, our unusual excitement may well be understood when Robert discovered, by some means or other—he is such a terrible one for sifting and prying into things, but there! men always are so curious—that she was the owner of a most wonderful and almost priceless set of brilliants, that had been presented to her by a great Maharajah, to whose children she had been governess. Again, it was said that she was penurious and miserly in her habits, as we knew our uncle had been. He had left her everything at his death; therefore, she must be, we argued, at least comfortably rich. East Indians are never really poor. Their wealth is proverbial. Kithless and kinless, save for ourselves, her approach filled us with joyful anticipations; and already in imagination each one of us saw himself, or herself, the owner of her matchless jewels and sole inheritor of her wealth. Martha and I were just discussing our second cup, and speculating as to the time of the old lady's arrival, then daily expected, when suddenly my little maid-of-all-work, whom I had despatched to the village on a marketing expedition, dashed into the room with her arms full of packages, and her tongue charged to its extreme tip with gossip.

'Well, Mary, what is it?' asked Martha, who saw that the child was bursting with news.

'Oh, if you please, m'm, she's come, and drove all the way in 'obson's one-horse shay, with a great screaming green poll-parrot in a brass cage beside the driver, and a black woman all in white, and a red silk pocket-handkercher tied over 'er 'air, and su'thing just like a lot o' little gold pimples agrowin' out o' one side of 'er nose.—I should not have bin so long, m'm,' she added, turning apologetically to me, as she at length paused in her lengthy harangue to get back her breath, 'but I stopped to see 'em take in the luggage and things.'

There was no need for any name to be mentioned. We both knew that she could only be referring to Aunt Purpose. A rigid cross-examination followed; but all that we could elicit from our informant was that Mrs Missle was a little, shrivelled-looking old woman, with a very yellow face, and a pair of bright black eyes just like a bird.

'Did you see Mr Robert there?' I asked uneasily.

'No, m'm; though, if you please, m'm, I eered at the post-office as Muster Robert 'ad gone to Southampton to meet 'is aunt.'

'Just like him! Sly and mean in all that he does!' was Martha's indignant comment as she rose and began to put on her shawl and gloves.

I wanted to be by myself to think over matters, and decide as to my conduct with Aunt Purpose, so I did not press her to stay; and I could easily see that she was quite as eager to leave me.

'Ought we to call to-night?' I asked her,

resolving that whatever underhand means Robert might have taken to forestall us in her favour, we two would be loyal to each other.

'I don't think so,' she answered in her usual doubting, hesitating manner. 'You see, she has chosen to come quietly and without telling us the time of her arrival; so I think it would be much better if we were to leave it now till the morning. She is certain to be tired after her journey. You might, however, send Mary round a little later to inquire after her, and with your love.'

After Martha had left me, I sat cogitating and considering. To wait till the morrow seemed a long time, when we knew that Robert was already laying siege to Aunt Purpose's affections. I felt uncomfortable at the idea of letting him have the field all to himself. At any rate—I argued to myself—there could be no harm in just going to see how matters were. 'Fair-play is a jewel all the world over.' I could easily explain everything to Martha, afterwards.

The determination was speedily put into execution; and I was soon equipped for my visit. As I passed out by the larder, my eyes fell upon a small corn-flour *blanc-mange* that I had made that morning. 'Poor thing!' I said to myself as I took up the dish on which it stood, and covering it with a small napkin, placed it in a basket; 'I daresay her appetite is not of the best; and then those East Indians always have bad digestions. I will take it to her. I am sure it will do her good. There's a whole pint of milk in it.'

Rose Cottage, whither I was bound, was about ten minutes' walk from my abode; but as I walked very fast, it could not have taken me more than eight, at the outside, to reach it. A strange servant-girl opened the door to me—one of that stupid, interfering Thomson the house-agent's importations. As if he could not have found a good honest girl in Nettlethorpe—one that we all knew—instead of bringing a stranger into the family!

'Aunt Purpose—Mrs Job Missle, I mean—has arrived, I believe?' I began, as the girl stood filling up the doorway, as if to bar my entrance.

'Yes, ma'am.'

'Will you give her this, with my love? Say, her niece, Miss Patience Missle, brought it. It is a little *blanc-mange*, and is made quite plain, without any flavouring.'

She took it from me, and would have left me standing on the doorstep—no Nettlethorpe girl would have dared to treat me thus—but I pushed by her.

'I will wait here,' I said, as I walked straight into the little sitting-room at the back and seated myself on a very hard-bottomed chair.

A door on one side led into the kitchen. Peeping through it, for it was half-opened, I saw the black attendant. She was dressed just as described by Mary; but she was holding something in her hand that, at that moment, excited in me a great deal more curiosity than either her colour or her costume. It was a small fancy basket of a peculiar pattern, that seemed very familiar to me. The sight of it awoke a sad misgiving at my heart, more especially as it was filled with eggs of that peculiar dark hue common to the poultry of Brahma and Cochinchina. Now, Martha possessed a basket the

exact counterpart of the one held by the black woman; and when I add that she owned half-a-dozen pets of the second-mentioned breed of fowls, my misgivings will be readily understood. To relieve my doubts, I crept into the kitchen, and overcoming my repugnance to people of colour, peeped over the black woman's shoulder. She gave a start, and rolling the whites of her black eyes at me, muttered something in her own language.—Yes; I was right! Martha had deceived me! There, on each egg, in her large skewery handwriting, was the name of the hen by which it had been laid, and the date of the interesting event. It is indeed disgraceful, when one's own flesh and blood turns against one! I returned to the little sitting-room, and then the servant came down.

'Missus is very much obliged to you, ma'am, for the *blanc-mange*; and she hopes that you'll excuse her, as she's too tired to see any one to-night.'

'How long is it since Miss Martha called?' I asked, taking the bull by the horns at once.

'She has only just left, ma'am.'

'Did she see your mistress?'

'Oh, dear no, ma'am. She had a message just like yours. Nothing more, ma'am.'

We had now reached the porch; and I was about to put a number of questions to her about her mistress, when a rough, hoarse voice called out: 'Get out, get out! Mind your own business!'

It so startled me—I thought it was the black woman—that I allowed the girl to close the door upon me before I recollected that it was only the parrot, whose cage had been hung just within the lobby. Vexed at my foolish conduct, I hastened homewards. As I neared Laurestinus Villa—Robert's residence—I met him. He was looking very hot and tired.

'What do you think, Patience?' he asked in a mysterious voice as I stopped to speak to him. 'She hasn't arrived. That fellow Thomson sent me a wild-goose chase to Southampton by telling me that she was coming over in the *Ruby*. Well, the *Ruby* is in; but she has brought no Purpose Missle in her.'

'No,' I answered with a quiet triumph, for I was glad that he had been done; 'of course not, because she came in the *Stella*. I read the name on her luggage. I have just come from the Cottage, where I was received most kindly. If you had come back by the express instead of waiting for the parliamentary, you would have had the pleasure of travelling with her.'

'Then, you've seen her?' he groaned in an anxious tone, as he mopped the perspiration from his dusty face, for it is a good five miles' walk from the station.

'Well, no—not exactly. The fact is, she is too tired to see any one to-night; but she sent me such a kind message.' With this I left him.

I knew, however, that he would never rest without going to the Cottage; so, as soon as I got home, I planted myself at my bedroom window to watch his movements. In a short time I saw him come out into his garden. His face had been washed and his coat changed. First, he picked two or three large sycamore leaves, with which he lined a small flat punnet basket that he held in his other hand; then he advanced to the south

wall, and stopped before the nectarine tree about which he makes such a fuss. One, two, three. Oh! how carefully and reluctantly he picked the ripe fruit! I could not help smiling as I watched him. I knew the action must have gone to his heart. He says that he sends the produce of his garden to his friends; but I know better. They are paying friends, and their address is not a hundred miles from Covent Garden Market. Robert is too genuine a Missle to give a *quid* without receiving a *quo*. The fruit was carefully arranged in the basket, and covered with more leaves; and then I saw him start off down the road to—I was as positive about it as if I had followed him every step of the way—Rose Cottage. Martha was right in stigmatising him as both mean and sly. It was too bad of him. His income must have been nearly double ours, which could well have stood an increase. His gallantry as a man should have made him remember that we were of the weaker sex, and he should have given way accordingly. But there—man again!—it is never anything else with them but self and number one, while we poor women may go to the wall or do the best we can.

### WILL POULTRY-FARMING PAY?

THIS is just one of those questions to which an off-hand answer cannot be given. It is difficult to say either 'Yes' or 'No,' for the reason, that the experiment of poultry-farming on a large scale has been so rarely tried in a way to insure success. One or two experiments in poultry-breeding on an extensive plan have, however, lately been ventured upon; but no statistics of the results, so far as we know, have yet been offered to the public.

One reason why those who require to purchase poultry have to pay so much for it, is because of its having to pass through many hands, each exacting tribute before it reaches our tables. Indeed, much of what we consume has hitherto come from France, Belgium, and Holland; and nowadays we are beginning to receive supplies from places more distant. It is somewhat surprising—considering that in London alone there is annually consumed over three and a half millions of domestic fowls, in addition to a million head of turkeys, geese, and ducks—that successful attempts have not yet been made to cultivate for home consumption on a large scale. But even in France, surprising as the statement may prove to many, there is no such establishment in existence as a farm solely or chiefly devoted to the rearing of poultry. From inquiries conducted by the writer of this paper, in Normandy and Brittany, and in districts to the south-west of Paris, as well as in the capital itself, it became evident that in no instance was a flock of over two hundred and fifty domestic fowls kept in one place, by way of a commercial speculation; indeed, it would be quite safe to assume that, throughout France, the stocks of fowls kept by individuals do not average half a dozen. But, as we all know, there are thousands of persons in France who farm, or possess in their own right, a little bit of land, nearly every one of whom keeps a few fowls as an adjunct to his business of farming or gardening, and to which he is enabled, from the paucity

of their number, to devote the closest individual attention. By such means the French have obtained a reputation for the excellence of their poultry, much of which, in consequence, finds its way to the London market. It may be stated that the value of the eggs and poultry imported into this country from the continent in 1879 amounted to £2,728,009; a small proportion of the sum is, we believe, paid for game; but substantially the money so expended is for poultry and eggs, the number of the latter imported in 1879 being 766,707,840.

It will be obvious enough from these figures that there is abundance of room at the present time for the breeding of poultry on some systematic plan. Just now, our supplies for table use, so far as they are provided in our own country, are chiefly collected from cottage cultivators, from persons who keep from half-a-dozen to twenty hens, and who either rear a few broods every season for the market, or keep their fowls only to lay eggs, for which there is a constant demand at remunerative prices. In the case of rearing a brood of chickens for market, great pains are taken to have them ready for sale at a time when they shall be of more than ordinary value. 'Spring chickens'—young fowls hatched early in the year, and carefully fed and fattened for the London season, which begins in February—bring a high price even to the cottagers who rear them, the cost to the consumer being correspondingly enhanced. The persons who travel in the county of Surrey, which is famed for its fowls, for the purpose of buying, and who are locally known as 'higglers,' will give at the rate of twenty-one shillings, or even more, for a dozen; these will be carried away to some centre of the trade, to be resold to an agent with a London connection, at probably a profit of four or five shillings per dozen; and these spring chickens, after being well fed for ten days or a fortnight, will be killed, plucked, and 'set up' for the London wholesale dealer at Leadenhall or Newgate Market, who is supposed to sell what he has consigned to him on commission, charging a percentage. These fowls will ultimately find their way to the clubs, restaurants, and private houses of the Great Metropolis; those who purchase them having paid to the retail dealer prices varying from eight to fourteen shillings a pair. In the very height of the London season, when the supply is not equal to the demand, 'fancy' prices can easily be obtained. It would not, we believe, be an extravagant estimate to say that seven shillings a pair could readily be obtained in the spring months for twenty thousand pairs of well fattened and nicely prepared chickens, if the breeder were to send direct to the poultry commission agents in Leadenhall Market. Taking the average market price for Surrey fowls—not the West End retail price—it was six shillings and threepence per fowl during January, February, March, and April 1880; and for about eight months of every year, similar prices are quoted. Sussex fowls are priced at about one shilling and sixpence less per head; whilst Boston (Lincolnshire) are cheaper; and Irish cheapest of all.

Enormous numbers of poultry are raised in Ireland for the Scottish and English markets. In Belfast, there are dealers who do nothing else but buy fowls for exportation to Liverpool and Glasgow, to be placed in the English and Scotch

markets; the more extensive dealers having also a retail shop, in which to dispose at a cheap rate of such fowls as are unfit to be sent across the water. These dealers attend all the little markets, and purchase their supplies from the small and large poultry-rearers, who arrive with their produce in carts, or in creels carried by donkeys. Much of the business is done by 'jobbers,' who correspond to the Surrey and Sussex 'higglers.' They intercept the peasantry, and small farmers on their way to market, and are usually successful in making a deal, which they turn over to the wholesale buyer at a penny or twopence of profit on each of the domestic fowls, and of from threepence to a shilling on each turkey. Some of these jobbers who have a little capital, make a profit of from a hundred to five hundred pounds per annum, as they enter into contracts to send all their purchases during the season to the men who export; and having thus secured an outlet, they attend all the out-of-the-way markets, and obtain pretty nearly a monopoly of the business, making, as we may say, their own prices. Some of the large Irish dealers will purchase a hundred dozen of fowls a day for export; and a Liverpool retailer has been known to dispose of seven hundred cock-turkeys received from Ireland in one week, that amount of business being done *after* Christmas week. These figures present some idea of the magnitude of the Irish poultry-trade. The best part of Ireland for the production of common fowls is Ulster, the breeders in that province paying great attention to the various crosses, and to the rearing and feeding of their poultry. In Dublin, they produce fine capons and ducklings much earlier than in any other part of Ireland. There are no distinct poultry-farms in any part of the country; but active farmers, when harvest is early, will purchase from the small breeders two or three hundred geese, and have them herded on the stubbles for a few weeks. A large trade is also done with Ireland in living geese, which are in large demand by English farmers who have early stubbles, in order to be fattened for Christmas.

An impression is prevalent among those who are only half informed on the subject, that a fowl may be kept for 'almost nothing;' and consequently, to keep a hundred hens and cocks would cost very little money, whilst the produce in eggs and chickens would yield an ample profit. On such an hypothesis, some enthusiastic persons exclaim: 'Why not start a poultry-farm, and breed chickens in thousands!' It is possible that some day such a scheme may be inaugurated, and also possible that it may prove a success. But before real success can be achieved, before it can be demonstrated that poultry-farming will pay—which is the grand aim and end of all such schemes—there is much to consider, and not one but a hundred details must be encountered before money can be earned. It was a saying of an eminent agriculturist, that almost anything could be achieved in farming if a person liked to spend twenty-two-and-sixpence in the pound in achieving it; and there are persons now engaged in the poultry-trade, or who at any rate keep fowls, whose eggs probably cost them a halfpenny each more than they can obtain for them; and whose chickens, for which they receive one shilling and ninepence a-head, cost, to hatch and breed, half-a-

crown apiece! That, of course, would never do in poultry-farming as a business. The farm must be made to pay; and how to balance accounts and leave a balance on the right side, is the question.

It undoubtedly pays our cottagers to keep half-a-dozen fowls, because the doing so involves but little extra expenditure; the fragments of the family food, with such little additions, in the way of slugs and worms, as they can pick up about the door, serve to fatten them; and as a rule, there are no bounds to the ground they may range over. As for the sitting, or as she is termed in Scotland, the 'clocking hen,' she monopolises the attention of the mistress of the cottage; and the little chicks are most carefully attended to as soon as they begin to make their appearance. When, however, we come to extensive poultry-rearing, the conditions are vastly altered. When food has to be purchased by the ton-weight, and a rent of from thirty to fifty shillings paid for every acre of ground devoted to the fowls—when special houses have to be built for their accommodation—when interest has to be charged for use of capital, and considerable amounts have to be expended in wages—the pounds, shillings, and pence incidental to the maintenance of a stock of poultry numbering a thousand head, present a totally different aspect from what they do when examined in connection with a cottager's dozen of hens, managed by the cottager's wife, and costing almost nothing for food. It is possible, however, to make it appear on paper that a handsome profit will be realised by the fowl-farmer; nor is it at all impossible that the success which can be shown in theory might with due care become a reality, if the affair be gone about in the right way.

Those venturing upon the organisation of a fowl-farm on an extensive scale, would require to be well advised before doing so; as the outlay, in the shape of expenditure for stock, the erection of proper buildings, and the payment of rent and wages, would undoubtedly be very considerable. The selection of the particular breed or breeds of fowls to be kept, would in itself necessitate a considerable knowledge of the trade. It would have to be determined, too, at the outset whether the farmer was to 'go in' for eggs, or for breeding and selling chickens and fowls. 'You see, sir,' said a Surrey 'higgler' to us, upon a recent occasion, 'some hens is good layers, and some is good sitters, and you don't generally do in both. Them as buys chickens and fowls, like to see 'em plump and white. For my part, sir, if I was going for to produce instead of to lay, I would keep none but Dorkings—they always plumps out nice, and makes a good price.'

There is at the present time a wonderful variety of hens in the country; but the best layers are found to be Andalusians, Minorcas, Hamburgs, and Leghorns. The first two classes lay very large eggs in proportion to their size. The following is the number that may reasonably be expected from these varieties. Andalusians, one hundred and eighty-five, six eggs to the pound; Minorcas, about the same number, the eggs weighing eight to the pound; Hamburgs, one hundred and fifty-six eggs, about ten of which weigh one pound; whilst Leghorns will sometimes lay as many

as one hundred and sixty, of nine to the pound. Houdans are also very good layers; as are likewise the La Flèche breed. The number of eggs given are calculated on the average, some individual fowls probably laying a few more, some a few less, than the numbers given above. Many circumstances conspire to affect the laying powers of hens, as an early season, suitable food, and a good run of ground. The Andalusian fowl would perhaps be an excellent one with which to stock a farm designed to produce both eggs and chickens, as the latter feather quickly, and grow with rapidity. Pullets of that breed have been known to begin laying when they were nineteen weeks old.

It will perhaps be found, when 'hen-farming' on a large scale is entered upon, that the best mode of procedure will be to separate the stock into collections of, say, a hundred each—each to be provided with a separate living-house and run. And in the matter of providing a hen-run, the farmer must not be niggardly of his space; for a thousand or twelve hundred fowls, there should at least be a run of twenty-five acres of ground, of the most varied kind. The land may of course be utilised in the production of food for the animals, as lettuces, greens, potatoes, barley, &c.; whilst a part of it might be utilised as an orchard for the production of fruit. Portions of the ground, half an acre here and there, should also be frequently turned over for the benefit of the hens; it would admit of their finding a large supply of worms and larvæ, of which they are very fond.

It has been calculated that fowls *en masse* may be fed at a fraction less than a penny per week for each animal; and with the data we have given, it should not prove difficult for any person to determine the L. s. d. of fowl-farming. The expenditure will resolve itself into rent, taxes, and wages—a thousand fowls would require at least three attendants—as well as interest on money expended on the original purchase of fowls, and on the buildings and alterations involved. The cost of food for a thousand animals would be about four pounds a week. The income would of course be made up from the sale of eggs at, say, one shilling a dozen; the sale of chickens at, say, one-and-ninence or two shillings each. An item in the credit account would necessarily be the valuable manure obtainable from a large stock. The receipts from the orchard would enter into the account, as would also the quantity of food produced on the acreage of ground. As regards the cost of a healthy breeding and laying stock to be acquired gradually, a fair price would probably be five shillings per head. There is an annual percentage of loss from accidents and disease; but such can only be calculated from experience. Various contrivances for the artificial hatching of eggs have lately been patented, and some of these, if successful, might be brought into use in poultry-farming. In various accounts of trials of hydro-incubators which we have perused, it is said that in some cases ninety per cent. of the eggs have been hatched. If that should prove to be true, there can be no doubt that the use of these artificial hatching-machines will become an important factor in the increased production of poultry.

We have in the foregoing remarks kept chiefly

in view the increasing of our supplies of domestic poultry. Turkey-rearing is more difficult; and the production of ducks and geese is a separate branch of the business.

## PRINTERS' BLUNDERS.

A GOOD deal has been written from time to time on the subject of printers' blunders. Few more entertaining topics could be discussed, and fresh material may be gathered almost any day from the newspapers, and even less ephemeral publications. Though many of the 'atrocities' which emanate from the type composing-room are intensely ludicrous, yet, as a rule, they are rather productive of merriment than mischief. The casual reader can, however, but faintly realise the mental agony inflicted by these fantastic tricks upon the unfortunate author whose brightest gems of thought and sentiment have been destroyed; or upon the public speaker, who finds that his oration, as presented to the world, contains expressions which he did not use, and never would have used. The editor can set himself and the orator right by correcting such errata in the next issue of his paper, and can have revenge by discharging both the compositor and the official whose duty it was to revise and correct the 'proofs;' but these considerations afford little comfort after all the little world you move in has laughed at the blunders. It must not be forgotten, moreover, that no compositor or reviser, however careful and experienced, is infallible, and that the successors of the delinquents might next day perpetrate even greater enormities. The author, it may also happen, is probably as much to blame as the compositor, as his manuscript may have been illegible, incomplete, or inaccurate. The majority of writers for the press leave far too much to the printer, not only in the matter of deciphering their scrawling caligraphy, but in punctuation and various other minor but essential details. Yet, on the other hand, there is no absolute safeguard against being victimised, for the most legible manuscript, even print itself, may be bungled by carelessness or stupidity in the composing-room.

The perversity of some printers is tantalising in the extreme. They frequently take it upon themselves to alter and amend what they, in their wisdom, suppose to be wrong, while it is really perfectly correct; and they as often adhere persistently to the manuscript, when it might be apparent to the meanest intelligence that a word has been omitted, or that, from some other cause, the sentence is imperfect or erroneous. Or they may substitute one word for another, making utter nonsense of the context. For instance, a compositor put into the mouth of one of Mr Gladstone's most ardent admirers the statement that the right honourable gentleman was 'the *spout* of the Liberal party,' when 'spirit' was the term employed. Another represented the Christian religion as enjoining *mahogany*, when it should have been 'monogamy;' while a third makes a *savant* learnedly state that 'the civilisation of the nineteenth century is a *country organ* [purely Aryan] development.'

The omission or addition of a single letter, or the substitution of a wrong one, sometimes pro-

duces the most comical results. A glowing writer is made to speak of certain of the works of Nature as 'silent preachers of *immorality*' [immortality]. It is rather imposing on the credulity of the public to state that 'a waterman rowing by at the time of the occurrence was knocked down, and one of his *ears* [oars] was carried at least thirty yards away;' and it seems an ungenerous reflection upon the bravery of the Peruvians to say that they 'expected to accomplish great things with their *feet*' [feet]. Still more unkind was it to describe the table decorations at a recent fashionable wedding as being composed of *pot-house* instead of 'hothouse' flowers. A Scotch evening paper congratulated a gardener not long ago on having, at a local horticultural show, produced the 'best six jargonelle pears fit for the *stable*' [table]. The *violent* [for violet] bouquet which, according to another contemporary, was presented to a lady at a public demonstration, should have been at the same exhibition. What sort of a biblical education had the compositor received who was responsible for the following? 'If they are true men, they would refuse to sell their birthright for a mess of *postage*.' And what is to be thought of the profane individual who, in setting up the verdict 'died by the visitation of God,' altered the fourth word to *hesitation*?

It may be thought that most of the errata we have quoted must have been due to illegible writing, and in all probability they were. One would expect that people who have sufficient leisure to make poetry should also have time to write out their effusions in a legible hand. Such is not always their practice, however; at least poets seem to complain as much of the printer's tricks as other classes. In a poem by a young lady, the line, 'Oh, for a heart full of sweet yearning!' occurred in the manuscript. But in print the last word appeared as *yearling*; and the poetess very naturally wrote to the editor that the compositor who had set up her effusion was a calf. There is a funny sketch by Max Adeler, in which he describes an interview between the editor of a newspaper and an outraged poet, who has come to complain of the publication of his contribution, entitled *The Surcease of Sorrow*, in which the line

Take away the jingling money; it is only glittering dross,

is rendered:

Take away thy jeering monkey on a sorely glandered boss.

And in another verse, the words

I am weary of the tossing of the ocean as it heaves,  
has blossomed into:

I am wearing out my trousers till they're open at the knees.

These, of course, are fictitious blunders; but it is not too much to say that they are founded on fact, and do not exaggerate very greatly the printer's capacity for burlesque. That versatile individual, however, makes an occasional essay in tragedy as well. A western newspaper reporting the annual meeting of the Glasgow Maternity Hospital, announced the other day that the

children *burned alive* in the Hospital during the year numbered two hundred and twenty-three, and at their own homes nine hundred and sixteen. It is necessary to explain that the word 'burned' should read 'boru.' Serious consequences might have resulted from the statement which appeared in an editorial article, to the effect that a certain eminent statesman was 'very fond of his *opium*,' had it not been satisfactorily explained that the editor wrote 'opinion.' What a sensation must have been caused in aristocratic circles by the announcement in a London journal of the Duchess of Hamilton's 'bankruptcy,' when it was only Her Grace's 'birthday' that was referred to! It was probably from a due sense of the fitness of things that a compositor, anxious that she should follow the example, perhaps, of one of her own heroines, married a novelist to a *prisoner*, whereas it was only a 'Prussian' to whom she had been espoused. Another London compositor was equally unhappy in spreading the intelligence that a certain lady had 'died of her marriage,' when it should have been of a hemorrhage. Alluding to Mr E. A. Freeman's peculiar political opinions, a writer was made to say, 'Coming as it does from one who has gained real distinction as a *barbarian*,' &c., when the complimentary word 'historian' was intended. In the same article, Mr Gladstone was represented as addressing a noisy *snob*, instead of a 'mob.'

Careless writing, with imperfectly formed letters, and a general appearance of dash and haste, is as frequently the cause of such blunders as the stupidity of the printer. It may have been due to some such cause that a person who advertised for a gardener, adding the information that there was 'no glass'—that is, no greenhouse—had the worry of seeing this appear as 'one glass;' naturally attended with inquiries from interested applicants wishing to know 'if it was in the forenoon,' and whether or not it was 'hot.' Again, a lady who was desirous of securing a housemaid, sent an advertisement to that effect to the local newspaper; but the notice when it appeared mortified the lady by representing her as advertising for a 'horseman.' There is a rollicking song by a certain Scottish Professor, in which he says:

I can like a hundred women,  
I can love a score.

But a compositor who put this in type changed the last word into 'scone,' thus dividing the learned poet's loves and likings between the Court of Venus and the baker.

Transposition of lines and words is also a frequent source of blunders, which in such cases are mainly due to the compositor. During an epidemic in a country-town in Scotland, three or four children in one family died in one week. About the same time, there occurred a marriage of some distinction in the district; notices of both events duly appearing in the local paper. But the friends of the married pair were staggered to read, after the enumeration of the names of the officiating clergymen, and those of the happy bride and bridegroom and their relations, the startling announcement that 'they were all interred yesterday in the cemetery.' It turned out, on explanation being required, that these words should have been appended to the notice of the death of the children above mentioned; but the compositor, in

a moment of stupidity or forgetfulness, had placed them instead after the notice of the fashionable wedding.

Numerous blunders are to be found where technicalities, proper names, and figures occur; but these are often detected by the initiated alone. To those unacquainted with the game of golf, for example, 'nursed a short put' is not much more unintelligible than 'missed a short put,' the phrase used by the reporter. The curiosity of bibliophiles and entomologists must have been excited when they read of the sale of a book entitled 'The Theatre of *Woodbugs*;' and though the former might unravel the mystery, it would hardly occur to the general reader that the work in question was *The Theatre of Worldlings*. Proper names are peculiarly liable to mutilation, as may be readily imagined. By the misplacing or multiplication of figures, some of the most astounding statistics have been produced, and we may sometimes read of events occurring on the 30th of February, or equally remarkable dates.

Were even the most carefully conducted newspaper to present its readers, say once a month, with a record of all the typographical errata which creep into its columns, the list would probably prove one of the most interesting features of the publication. Yet, after all, considering the great rapidity with which the daily journal is composed and printed, the wonder is, not that mistakes occur, but that they are so comparatively rare. Our larger daily papers have literary matter in them equal to double what is comprised in an ordinary three-volume novel; and when it is remembered the greater portion of this matter has to be put in type in less than twenty-four hours, it is little short of marvellous that such great accuracy is attained. The daily newspaper may justly be regarded as one of the most striking illustrations of what can be accomplished, when the pressure of the time demands it, by human ingenuity and organisation.

## ON THE USE OF FLOWERS.

Our outward life requires them not;  
Then wherefore had they birth?—  
To minister delight to man,  
To beautify the Earth.

M. HOWITT.

I AM so fond of flowers, that I must ask your forbearance if I seem to give their cultivation too high a place amongst the duties and pleasures of life. They always seem to me to be so fresh and pure, as if just from the hand of God, that I think their value can scarcely be too highly estimated. One of the first uses of flowers is, I believe, the delight and refreshment they give to many a weary wanderer; and the help they often are not only in pleasing the eye, but of calling the anxious heart away, unconsciously, from its cares and troubles. The practice of taking a bouquet of flowers to a Sunday-school adult class, and having this carried to the bedside of some sufferer, has increased of late years, and is, I believe, a source of good to those who are sharers in the mission. The men or women who take part in such a class, look anxiously and hopefully for their turn to

be the bearers of such a treasure to their sick friend or neighbour.

Flowers have a very refining influence. The young lady who in her daily walks culls the season's brightest wayside gems, small and retiring though they may be, has her perceptions cultivated, her gentle touch improved, and her love of the beauty of form and colour intensified and increased. I have sometimes been amused to watch the gathering of a bouquet by two equally kind sisters. One, who 'does not care much for flowers,' yet delights in giving pleasure, takes her garden scissors, cuts the brightest and perhaps the largest flowers she sees, never stopping to notice that some of the petals are faded, and others following rapidly the same way. She looks here, and takes a flower she thinks is bright; there, and cuts off a handful; and having, as she believes, gathered a large and beautiful bouquet, she hands it to the lady whom she has thus stepped out of her course to please. Perhaps if we could unperceived follow those flowers to their destination, we should see the half of them lying wasted, fallen to pieces, and quite unfit to ornament the room for which they were intended; and by the thoughtless cutting of those full-grown and showy flowers, the garden may for that day have lost its brilliance. The other sister, who loves flowers for their purity and beauty, glides from plant to plant, cutting off one blossom here, which will scarcely be missed from its modest position; another there, which will bloom in full freshness in the vase—a bit of sweet-scented beauty which by its removal improves the garden, while it adds to her treasures; and so from flower to shrub, and from rose-tree to flower again, she flits along—the selection being intuitively made with such perfection, that no blossom is misplaced, or a single fading flower added to the posy.

This nicety of observation and touch does not end in the service of the garden. A mind that responds to the beauty of the floral world will never be satisfied with imperfect or coarsely finished work of any kind. The handling of flowers so constantly sets before the eye their perfection, that by-and-by the aim at perfection in all that is done becomes, as it were, second nature.

The pleasure that flowers give to invalids among the poor, who rarely see any, might teach some of us a lesson we should do well to learn. The first time I saw this was many years ago, when I was a very young housekeeper, and was startled one Sunday morning by the request, from a working blacksmith, for some grapes for his sick wife. We had no greenhouse or vinery. Our little bit of garden was most unassuming, and I could not think what made the man come to me. However, I told him that I believed a friend of ours had some early grapes and if I could get some, his wife should have them in the afternoon. My husband walked out with me to our friend's house. Some grapes were most willingly given for the invalid, and some flowers for ourselves. I took two or three pretty and sweet flowers—I remember that a carnation and two sweet-peas formed part—tied them together; and we took them with the fruit to the sick woman. We were taken up to her bedroom. There she lay, pale and emaciated, with that ominous flush on her cheeks which too

truly confirmed her husband's words. We handed her the longed-for grapes. She was 'much obliged.' But when I held out to her the few flowers I had brought, she snatched them so eagerly, that I was startled and awed to see the delight they gave to one who was evidently so near the confines of the Unknown.

I called again in a day or two, and saw the flowers carefully preserved and looking bright in a doctor's medicine bottle close by her bedside. That scene taught me a lesson I have never forgotten, and I hope it was not without its use also.

This reminds me of what occurred in a country town one autumn, now some years ago. A very young lady, the grand-daughter of the late vicar, was married. The bridal party was large, and the bride lovely. A poor young girl, dying of consumption, who had received much kindness from her more favoured friend, was brought by some kind neighbours into the market-place to see the wedding-party pass. The bride was told of this; and on leaving after the breakfast, she sent her bouquet to her afflicted friend. Who can tell the good done to each of these two girls by that thoughtful act? The lovely white flowers would speak, oh! so eloquently of the loving giver; and who shall say they did not lead the fading girl to trust more and more implicitly in the love and mercy of her ever-present God? And would not the heart of the bride be touched and softened by the remembrance that her bridal flowers, in all their purity and beauty, had brightened the room where sickness and sorrow dwelt?

I am often sorry that so few young ladies now take pleasure in the practical part of gardening. I believe they lose much healthy enjoyment. In sowing annuals, watering them, clearing away the weeds as soon as they appear, planting a few bedding-plants in a piece of garden, they would find much health-giving amusement, and might pass many profitable and pleasant hours.

#### THE 'WHITE WATER' OF THE ARABIAN SEA.

With reference to the phenomenon of what is known as the 'white water' of the Arabian Sea, a correspondent writes as follows: 'If the call of duty or pleasure should at any time induce any of your readers to undertake the overland journey to India, they must not fail to give instructions to be called from bed should the nocturnal phenomenon of the "white water" occur. It is more frequently seen in the months of July and August, and is principally confined to a narrow belt to the eastward of the island of Socotra, known in the charts of that sea as the Line of the Strongest Monsoon, and wherein the rain-clouds on quitting Central Africa on their passage eastward are apparently confined. Should the moon be above the horizon, an undisturbed night's rest may be anticipated, as the writer has never known the phenomenon to occur in the presence of that orb.

'To give the reader some idea of this remarkable and striking appearance, we will suppose ourselves in a steamer, about two hundred and fifty miles to the eastward of Socotra, in the position named, and in the latter end of July; time, one A.M. The monsoon is blowing strongly and steadily—the night, star-light and clear—a

light fleecy scud occasionally passing rapidly to the eastward; and the good vessel bowling along at the rate of fourteen or fifteen knots an hour. Suddenly we discover a light hue in the water, which in a short while assumes a snow-white aspect, and in the course of a quarter of an hour extends to the horizon in all directions. The transformation of the water is perfect, the usually green colour of the sea having been replaced by an appearance of whiteness like that of milk. And yet, if you draw a bucket of the water for inspection and analysis, you will find that it is beautifully clear, not a vestige of anything white being visible; nor can the microscope discover anything over and above the ordinary quantity of minute life always present in sea-water within the tropics.

'The deception seems to me to admit of easy explanation, it being the result simply of reflection of colour. The vessel is passing through a light misty atmosphere, inappreciable to the eye while within its influence; and the white watery vesicles held in suspension are, in some favourable condition of air and water, reflected on the surface of the latter. When the phenomenon has lasted about an hour and a half, to the experienced eye signs of its dissolution will become visible: the vessel is, in fact, passing out of its influence, the skyline of the horizon ahead marking the limit of the mist. When clearly defined, the horizon-limit assumes an intense blackness, through which the stars shine brilliantly; and when at length the ship apparently shoots through it, the transformation seems to have been effected by magic. Looking astern, the misty atmosphere through which we have passed is distinctly visible; the intensely black sky is gradually lowering as the steamer speeds onward, presently dipping below the horizon, and obliterating all traces of this weird and impressive scene.'

#### LOVERS STILL.

THE moonlight of romance was ours  
In that remembered month of May;  
We bowed to Love's compelling powers;  
Yet, Love, I love thee more to-day.

Love's morn with golden glamour rose;  
He held us in imperious sway;  
Yet loved we not so well in those  
Bright days as, Love, we love to-day.

Then Pleasure took us by the hands,  
And led us up Love's shining way;  
But now our love through Sorrow stands,  
And Grief has made us one to-day.

As stalwart smiths alternate bring  
Their blows with all the might they may,  
So Hope and Fear have wrought the ring  
That keeps us lovers still to-day.

More solemn blessing than the priest,  
Grave Time has given us; so we pray,  
When Death shall stay Life's palling feast,  
We shall go lovers, as to-day.

## ASYLUMS AND THE INSANE.

BY A 'MAD DOCTOR.'

WHEN one considers that a considerable proportion of the population of the United Kingdom—namely, one in every three hundred and fifty—are insane, it is almost incredible that such an amount of ignorance should exist even among the educated classes on the subject of asylums and the insane. One notion, by no means uncommon, is, that an asylum is a sort of menagerie in which are confined demons in human form—men and women who are chained up who make day as well as night hideous with continual noise, whose minds are complete wrecks, in which nothing but the lowest animal attributes predominate—people who with distorted faces, dishevelled locks, and fantastic garb, never cease to gibber forth incoherent ravings and blasphemy. Now, there must be some reason and origin for this undoubtedly popular notion; and when we come to consider it, the reason is not after all far to seek; for so lately as 1820, there was amongst philanthropists and medical men generally, almost entire ignorance of the whole nature and treatment of insanity. On account of this ignorance, the condition of the insane at that date was the most deplorable to conceive; they were looked upon as outcasts of the earth, and were reduced to a condition which it is not in the power of language to describe.

It may be of interest to our readers to know that we owe the great advance in the understanding and consequent treatment of insanity to two great French physicians, Esquirol and Pinel, whose names on this account alone will never cease to burn brightly among the luminaries of science. During the time of the Revolution, when Robespierre and his colleagues were in power, Esquirol was much struck by the condition of the Bicêtre, a large prison-like building in which all the mad folk were incarcerated, chained up in cells like so many wild beasts; sleeping, when that luxury was possible, on stone floors, sprinkled with filthy straw; and whose food was thrown to them as to

dogs, by a surly jailer, only too ready to use the stout whip with which we always find him armed in old pictures. He applied to the government for power to introduce reforms into these dens of cruelty and darkness. By them he was given *carte-blanche* to do as he pleased. The authorities at the time having 'other fish to fry,' never gave the subject a thought; so Esquirol, unloosing their chains, gave them liberty, food, and light; and found, as he expected, that not only did they refrain from at once tearing themselves to pieces, as their keepers protested they would, but that a gradual and manifest improvement took place in their mental state.

Thus began a new era for those visited with the greatest of all human afflictions. It would be interesting to trace the gradual spread of the new principle, inaugurated by Esquirol, all over the world; but space forbids: suffice it to say, that from that day to this, steady increase and improvement in our knowledge and treatment of insanity has gone on, until, at the present moment, hundreds are devoting their energies and lives to this cause. It may not be generally known that towards the end of the last century the public were admitted to a well-known London asylum to view the lunatics at the modest charge of a penny a head. From this the asylum derived an income of upwards of four hundred pounds a year, until the revolting practice was put a stop to.

Asylums nowadays are of two great classes—private and public; the essential difference between these being, that in the former, patients are maintained at their own or friends' expense; and in the latter, by the parish. The asylum buildings are generally spacious and handsome, situated in extensive grounds; and in these grounds one finds, as a rule, a church or chapel, in which divine service is conducted on Sundays, and at which, on an average, two-thirds of the total number of patients attend. The usual church service is gone through, the patients joining heartily in the singing, and displaying a decorum which would be creditable to any congregation. Another notable feature of the asylum the writer is now

describing is the Farm, which not only affords congenial employment to many patients, but is, if well managed, a source of income to the asylum estate.

The best idea of the patients and their surroundings is to be formed by accompanying the superintending physician in his morning visit, as he sets out armed with book and stethoscope, bent on seeing all those under his care, questioning some, encouraging others, and having a kindly word for every one. The first ward entered is the receiving ward, where recently admitted patients are quartered, their peculiarities and propensities studied, their bodily and mental state carefully inquired into, and the lines of treatment considered. Visitors will be at once struck by the brightness and cheerfulness of the ward itself. Structurally, it consists of a gallery or promenade, at one end of which is the 'day-room,' in which the patients can sit and sew, and where they can mess if necessary. The walls of both gallery and day-room are hung with pictures, statuettes, and other forms of decoration. Creepers and flowers adorn the window-sills and tables in profusion. A piano also is there, which bears evidence of being well used; and an aquarium, the latter affording a never-ending fund of amusement.

There are many fallacies in the public mind about the insane, prominent among which is the notion that if a person be mad, he must be lost to all reason, and be quite incapable of employing or amusing himself and others. One instance may be given in refutation of this idea. One day I saw a lady whose resources did not admit of her being in a private asylum—and there are many such persons—seated at a piano, when she gave a most charming and correct rendering of the *Moonlight Sonata*. This finished, she turned round, and asked me no end of absurd questions, some of which I remember were: Did I write the Psalms of David, and was I the son of Abraham; and if so, what was the definition of a minor key. Thus, then, this woman who was quite incapable of conducting her affairs, or mixing in society, seemed quite happy, and was quite able to amuse herself and others by her musical talent. The ward may contain thirty patients, under the immediate control of two nurses, of whom the patients are generally very fond. The nurses are fully aware that in many cases the patients under their care are peculiarly sensitive, and need coaxing and consideration, combined with firmness; and as a rule, kindly requests to join in games, or do some sewing, or like work, are met with ready compliance. It must be mentioned that the duties of these nurses are of an extremely responsible and anxious character; demanding incessant activity and patience, to induce those under their care to take their food, to work, to join in their games and recreations, and to perform in a becoming manner the duties of everyday life.

The next ward is the infirmary, to which all cases of severe bodily and mental illness occurring in the house are sent; and it need only be said that the same order and cleanliness here prevail; added to which, are all the usual hospital appliances for the nursing and management of the sick. Here, naturally, the cases are of a very hopeless and unfavourable character; yet careful attention

to their comforts is everywhere apparent—water-pillows, modern wire mattresses, comfortable seats, and all the relief that medicine and sick-diet can afford. What a different picture this, from the chains, whips, and stone floors of a century ago!

Next, the visitor is shown what might be termed the ward for the worst cases. Here the number of the nurses is greater, as many of the patients are at times violent and dangerous, chiefly as a result of the brain disease termed epilepsy, in which the patient is subject to fits, before or after which, he will become extremely violent, and assault or attack those nearest to him, under the transient delusion that they are going to kill or injure him. Although the worst types of humanity are confined here, the same order and control are observed as elsewhere. We learn that restraint and seclusion—the latter meaning temporary solitary confinement—are quite unknown; strait-jackets and manacles being things of the past. The excitement and fury of epileptic mania is treated on the more rational system of long exercise in the open air, which naturally induces sleep and rest at night, the temporary attack soon passing off.

These three kinds of wards, briefly described, are the chief types met with in asylums. Many new asylums have special wards for convalescent cases, these often taking the form of detached cottages, where a sort of trial may be made of the patient's ability to cope with the battle of life; for many patients who seem quite rational and well conducted when under asylum care, where all their wants are supplied, at once break down when they return to their homes, and are thrown to a great extent on their own resources.

A great source of anxiety to an asylum physician is the suicidal tendency of many of his patients, to frustrate attempts at which never-ceasing vigilance is necessary. At times, however, the ingenuity and determination which the insane, and notably the melancholic and depressed, will display in carrying out their sad aims, evade all watchfulness. A few instances of this may be of interest. A butcher, middle-aged, was brought under asylum care, suffering from melancholia, the assigned cause being intemperance and hereditary predisposition. On the morning of the 9th of April, shortly before nine A.M.—and it may be here noted as a remarkable fact that the majority of suicides occur in the morning—he had finished breakfast, and there was no apparent change in his mental state, he having joked with the attendant in charge of the ward, and employed himself in dusting, as he was in the habit of doing. He then went into a little four-bedded room opening off the ward, carrying his duster with him, took from the wall a looking-glass that was hanging up, and placed it on a bed resting against the wall. He also took from the wall a small glass-framed Scripture text, the words on which were, 'God is my helper,' and covering the text with the duster, so as to make as little noise as possible, he broke the glass. He then appears to have covered his right hand with the duster, so as to get more purchase, and deliberately kneeling down by the side of the bed, so as to enable him to see the whole operation, with a piece of the broken glass he inflicted a large deep ragged wound on the left side of the neck, severing such important blood-vessels that he died from hemorrhage in a few minutes.

Another patient I remember, an elderly gentleman, finding himself so closely watched that he could not make any open or flagrant attempt, had recourse to tearing a bit of bandage off the dressing for an ulcer on his leg, and stuffing this into his mouth. Luckily, he was noticed after he had crammed about a yard down his throat. He was livid and unconscious, and could only be brought round with difficulty.

Another form of attempted suicide commonly met with is the persistent refusal of food; this, however, is readily combated by a well-known mechanical method of injecting food into the stomach. One patient I remember was fed in this way for eight months; for so long a time did all attempts to induce him to eat in the ordinary way prove fruitless. It is not always, however, with the desire to end their existence that lunatics obstinately refuse food; it is as often owing to the delusion that the food is poisoned; or that a voice prompts them not to eat; or that they have no inside. One old lady, I remember well, on my urging her to take her food, replied: 'My dear doctor, what is the use when my inside is made of wood?' This woman, though rational in many ways, maintained this curious fancy against all argument.

Let us now turn to a brighter aspect of asylum life—namely, the amusements and recreations. These in summer take the form of lengthened walks into the surrounding country, picnics, and so forth. Nearly every asylum has its cricket and football club. These clubs play among themselves, or try their fortune with those of the neighbouring villages. The matches are looked forward to all week, and the utmost good-will and pleasure prevail during the play.

Then in the winter months, the long evenings are beguiled by the weekly entertainment, consisting of instructive and amusing readings, music, songs, dances, and occasional dramatic performances; to which all contribute, more or less—doctors, patients, and nurses. Every season confirms the value of these entertainments as a beneficial and sustaining agency in mental distress, directly by the healthful stimulus they impart, and indirectly by breaking up the somewhat monotonous existence of those who are too feeble for active employment. By the smile on the face of the habitual melancholic, one is assured of their advantage, and is reminded of one of Luther's sayings, 'Music is one of the most delightful and magnificent presents that God has given us.' More than one patient has assured me that he owes his recovery in a large measure to the rousing, exhilarating effect of the weekly entertainment.

Let it not be supposed, however, from the above remarks that all the requirements of the insane are fully provided for, and that no assistance is desired from the benevolent public outside; for it is remarkable that whilst Infirmarys, Hospitals, Workhouses, Homes, &c., are well remembered by the charitable and philanthropic, the asylum and its patients are too often overlooked. The following are some of the channels in which aid might be acceptably rendered—newspapers, books, and other publications for the library; pictures or prints for the wards; flowers and fruit; entertainments of any kind, musical or dramatic; lectures, readings, magic-lantern exhibitions, &c.

Here, then, is ample scope for the charitable to show real and practical sympathy with those who are less intellectually healthy than ourselves.

It is certainly not too much to say, that by the above means, we may hope for a higher recovery-rate among the curable cases, and to soothe, cheer, and interest the hopelessly insane. We are encouraged in our endeavours by the fact, which is probably not generally known, that the recovery-rate has gradually increased from a figure which were better left untold, to a proportion not far removed from fifty per cent.

In this short article, I have tried to convey an idea how the insane are cared for in this country. I say in this country advisedly; for although we owe the initial step in our progress in this direction to the French, yet in no country has the principle been so earnestly and vigorously carried out as in Great Britain. I have left untouched many points of interest connected with this subject, notably private asylums and supposed undue detention in them. These I hope to treat of at some future time.

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER XXX.—AT SOUTHAMPTON.

BUT a little way 'Above Bar'—as natives of the ancient city of Southampton are apt to say in speaking of that antique barrier-gate which Ascarth the Giant and the valiant Sir Bevis so stoutly defended of old against Paynim foes, according to the veracious lays of the minstrels—stands a row of fair white mansions which bears the name of Portland Place. There is one of these mansions which stands detached, with gardens and stable dependences of its own, and which also has the advantage of an outlook over the famous old Archery Grounds that are the boast of the adjoining shire. House and gardens belonged to Mr Weston, Manager of the Branch Yard of Mervyn & Co., and who, having some share in the business in addition to the high salary attached to the responsible post he filled, was regarded by his neighbours as relatively a wealthy man.

It was a fine summer's afternoon; and the scent of flowers and the hum of bees came pleasantly through the open windows of the Westons' drawing-room, where all the family group, with the exception of the master of the house, who had not yet returned from the vicinity of the Docks, might be seen. It consisted of Mrs Weston, kind, plump, and motherly, one of those women whom it is difficult to imagine as otherwise than married and busy with household cares; her two daughters; and a third young lady, whose degree of kindred to Mrs Weston herself could only be computed by the learned in Welsh cousinhood; but who, as a ward of her husband's, had for some years made that house her home—Miss Carrington by name.

The last-mentioned member of the family group was undoubtedly the one who would have been the first to attract, and probably to rivet, the notice of a stranger. Julia Carrington may have been a year or two younger than the elder of the Weston girls, a few months older than the youngest; but their round, pleasant faces merely served as a foil to the brilliant loveliness of their kinswoman. A dark, flashing-eyed beauty was

Julia Carrington, tall, graceful, and with raven hair, and creamy complexion, and lips and teeth that could be likened to coral and pearls alone, however hackneyed the simile may be—such a girl as we see, perhaps, twice or thrice in a lifetime, and whom the imagination willingly accredits with an almost unlimited power of wringing or breaking the hearts of men. There were those who, confessing that Julia was exceedingly beautiful, nevertheless declared her dark beauty to be of an un-English type, alien, foreign, Spanish or Italian, rather than what befits our cloudy skies and island hearths. One love-lorn curate—who never told his love—the Rev. Septimus Shyson, had mentioned in confidence over the social teacup to a brother of the cloth clerical, that her haughty, pitiless charms reminded him of the patrician damsels of ancient Rome.

There are wards and wards, as there are heiresses and heiresses. Some girls are by nature so submissive to the merest semblance of authority, that their guardians have an easy task. Others, like high-mettled fillies, kick over the traces, and give infinite trouble to the respectable men on whom the provisions of some will have devolved part of the powers of a father. Miss Carrington went into neither of these extremes. Indeed, she was too clever, and her guardian, Mr Weston, too sensible and straightforward, for much jarring of volitions to be probable. She was in legal leading-strings as yet, being but twenty years of age; but soon she would be her own mistress, and mistress of the three thousand a year which her father, a former partner and remote connection of Mr Mervyn, had left her. It was not a great income, in these days when incomes are really great, but it was almost wealth; and was enough, at all events, to earn for Julia Carrington the prestige of heiressdom. For four years past, Mr Weston had by consent received five hundred a year for the maintenance of his ward, whose allowance of pocket-money was also on a lavish scale; but extravagant as the young lady's tastes might be, her money was rolling up, like a golden snowball, and needed but a prolonged minority to swell the original sum to imposing proportions. Therefore was Julia, with her beauty and her fortune, and her disdain for such admirers as ventured to approach her, a personage of some note in the society in which the Westons moved.

That this proud, self-willed girl should have been so well liked as she was by the family with whom she lived, much as a bird of gorgeous plumage might dwell among nestlings of quite another feather, was perhaps not so strange as it seems. Women are very tolerant of the superiority and the pretensions of others, provided that the superiority is patent, and the pretensions consistently asserted. That Julia, as an heiress and a beauty, had a right to be a petted, privileged person, and to have her own way within all reasonable limits, was a canon of faith among the Westons. The good 'house-mother,' to quote the expressive Teutonic phrase, would never have dreamed of indulging her own daughters, Margaret and Matilda, as she humoured the whims of Miss Carrington. The two girls were honestly enthusiastic, as we now and then find girls to be, in their admiration of this companion of theirs, whose loveliness threw them so utterly into the

shade, and seemed rather to plume themselves on the distinction of having beneath their roof so notable a guest as Julia Carrington.

'It is getting late. I doubt if he is coming to-day, after all,' said Mrs Weston, looking up, from her work, at the clock.

'The train is behind time, I daresay; but I suppose he will come. Papa asked him, when he wrote, to drive straight here from the station; and I hope he will, for I feel quite inquisitive about him, after all we have heard,' said cheery, light-hearted Margaret.

'Inquisitive? about whom?' asked the fair Julia, as she lounged in her silken beehive chair, and glanced for an instant over the rim of the open novel that she held listlessly between her jewelled fingers.

'About the new arrival, dear—this young Mr Oakley, who is to be papa's second in command here—the new Assistant Manager,' exclaimed Matilda Weston. 'We have heard so much of his praises, that we are dying to see what he is really like.'

'Pray, leave me out of the category of those who are dying for such a cause,' said the heiress, in the half-languid, half-scornful tone that was habitual to her. 'I have not the faintest curiosity on the subject.'

'Julia,' remarked Mrs Weston, with her matronly smile—'Julia is not a hero-worshipper.'

'Not of Cockney heroes!' retorted the heiress, from her silken beehive chair.

'But he—this Mr Bertram Oakley—he is not a Cockney,' pleaded the elder of the Weston girls.

'Not at all. He comes from'—began the younger.

'Pray, don't, Margaret dear, and Matilda, my pet, give yourselves the trouble of enlightening my ignorance as to the antecedents of this Mr—whatever you call him—who is going to be Assistant something. That he is a meritorious young man, I think very likely. Many people are. But, of course he will be clumsy or else conceited; tiresome, anyway.'

At this crisis of the conversation came the roll of wheels, and then the sound of the bell; and presently the door opened, and the name of 'Mr Oakley' being announced, Bertram entered, all unaware that he himself had formed the subject of the late discussion; and he had not been in the room for thirty seconds, or spoken a dozen words, before the Weston womankind, mother and daughters, predisposed in his favour from the first, were certain that they should like him, and certain too that the good report of him which had reached them was by no means too flattering. He was very handsome, and that, in feminine eyes, does a man no harm. Instinctively, Miss Weston and her sister turned their eyes to Julia, as if to draw a comparison between the two bright young faces; but of Miss Carrington's lineaments not much could be seen, as the heiress, after a cold and slightly perceptible nod, in answer to Bertram's bow, had sunk back in her chair, and absorbed herself wholly in the pages of her novel.

The talk, as may be supposed, was not very well worth chronicling. Mr Mervyn was quite well? Mrs Weston was glad of that. And Bertram was not tired? But then railway journeys are so easy and smooth; not like the coaching and posting

days of which Mrs Weston in effect remembered not very much, but on which she had heard her own father descant feelingly in her nonage. And Mr Weston would soon be back from his place of business, and would be very glad to see Mr Oakley, of whom they had all heard so much, and who really must not consider himself as a stranger, &c. All this was very kind, if a trifle commonplace; but we could not get on without household angels of Mrs Weston's sort; and, to her words of welcome, Bertram made appropriate replies; while the heiress read on, and the two other girls spoke little, but looked intently at the young man of whom Mr Mervyn thought so highly.

How, or by what chance, the conversation drifted into some channel a shade less conventional, and one which allowed of answers not stereotyped, it would be hard to tell; but somehow Bertram found himself talking, and the ladies listening, and, marvel of marvels! the proud, scornful beauty in the beehive chair, having lowered the rampart of her new novel from the circulating library, listening too! No one on earth could be freer from any desire for display than Bertram Oakley; but he could speak, and speak well, on any topic concerning which he felt strongly; yet it was not so much what he said, as his manner of saying it, that won him the rare compliment of Miss Carrington's attention. Bertram possessed in a very high degree the unconscious gift of pleasing, the inimitable something that no master of worldly lore can impart, no self-study teach, the talisman that belongs to a sweet and noble nature when united to a busy and fertile brain. He was so frankly and fearlessly self-possessed, that he lost nothing by that fatal flaw of shyness, of false shame, as the French call it, which makes so many a good and worthy man ridiculous in feminine eyes.

Presently, the beautiful statue, Julia Carrington, warmed, as marble in old Greek myths was supposed to warm, sufficiently to speak, and look, and avow an interest in what the new-comer thought and said. When Mr Weston's bluff, shrewd face, and grizzled whiskers, became visible in the doorway, he found his new Assistant apparently on friendly terms with the fairer portion of his household. His own greeting to Bertram was cordial; but possibly his look was more critical than admiring. The Manager was privately of opinion that his principal had been over-partial, and that to appoint so young a man to so high a post was necessarily a mistake. Still, he shook Bertram's hand, and welcomed him to Southampton heartily enough.

'I have taken rooms for you, Mr Oakley, at Mr Mervyn's wish,' he said, 'near us—just a sitting-room and bedroom on the ground-floor of a quiet house, in the neat little street you must have traversed, to get here from the High Street and the Bar. I shall be happy, if you like, to walk as far as that with you, and put you in possession of your new quarters. Change them, of course, if you don't like them; but I think you will find them comfortable, and the people civil.'

So Bertram was inducted into his new lodgings, which were tidy and trim enough after their kind, and whither his luggage was presently conveyed; while Mr Weston went home to his dinner, and Bertram complied with his landlady's proposal of adding a mutton-chop to his tea. The days were

yet so long, that, after his modest repast was over, he had light enough left to stroll for some time about the town, to admire its stately High Street, perhaps unmatched in any provincial city between Tweed and Tamar; its quaint churches, beneath the low-browed arches of some of which Henry V. probably, and Walthef and William the Norman possibly, may have gone in to pray; and the crowded Docks that have given new life to the ancient seaport. Then, as he laid his head upon his pillow, he could not but wonder that the memory that was uppermost in his thoughts was not that of Julia Carrington, in all the audacious splendour of her attractions, but of the golden hair and blue soft eyes of Rose Denham, who was now so near.

### SOME WHIMSICAL PARISH CUSTOMS.

THE *parish* is one of the oldest divisions of land in this country; so old, indeed, that antiquaries and county historians are in controversy how much more than twelve or fourteen hundred years ago it was first established. As may naturally be expected, many curious customs gradually sprung up, some in one parish, some in another, some in two or more adjoining parishes; some long since become obsolete, others still flourishing more or less. We can trace the influence of the church, of the feudal system, of the rise of royal power and prestige, in some or other of them; but ignorance and superstition were probably the most potent causes. A considerable number of these old customs had their origin in *endowments*, sums of money or patches of land, the annual proceeds of which were to be appropriated in perpetuity for certain objects more or less clearly specified by the donor.

The parish books kept by churchwardens are a veritable mine of facts relating to such matters. The books of a Lincolnshire parish, for instance, contain numerous entries concerning the marrying of paupers, the whipping of vagrants, the baiting of bulls, &c. Those of Stanford-in-the-Vale, Berkshire, comprise some curious entries relating thereto in the old Catholic times; such as: 'Received for the maydes at the Hallowtide towards the bells,' so much. It appears that young maidens perambulated the streets, dressed in black, ringing bells, and urging the people to prayers on the eve of All-Saints-Day; and the item was as payment for the bells. Another payment was for 'watching the sepulchre'; a crucifix, wrapped in linen, was placed in a recess formed on the north side of the altar; this was done on Easter Eve, and the watching was kept up until early on Easter Sunday, when the crucifix was removed, with various circumstances typical of the resurrection. Other entries relate to less solemn subjects: 'Money received for the gaynes of the May ale,' There being no poor-rates in those days, one mode of obtaining small sums for the succour of the sick and needy was to solicit gifts for the purchase of malt, with which ale was brewed, sold to the parishioners, and the profit or 'gaynes' given to the poor. 'Money received for the font' was obtained by young maidens who went from house to house at Whitsuntide, solicited alms, gave half the amount to the poor, laid out the rest in purchasing a dove to suspend from the roof of the church over the font.

At Waltham Abbey, the parish books contain

evidence of a change in many of the items of expenditure, contemporaneous with the change in the religion of the state. The wax for the tapers and candles used at the altar and in church processions, had been bought in the lump, and made up as wanted. When the altar lights were no longer sanctioned in the Established Church, the wax was sold. One of the entries mentions the price obtained for the wax. Other entries bear relation to the sale of priests' garments. The parish books of Abingdon contain notifications of money paid to the bellman to buy food, drink, and firing for 'watching the sepulchre.' Money was also paid for two dozen bells for the morris-dancers; setting up Robin Hood's bower; an hour-glass for the pulpit—and other singularities long since abandoned.

The curious old parish custom of *beating the bounds*, though not nearly so prevalent as in by-gone times, is still kept up in some districts, and has become by degrees an occasion for feasting rather than fasting. It often lasted two days, under the management of the clergy, churchwardens, and parish officers. Every parish has a boundary legally established, although visible marks for denoting it are few in number; and in past times the ceremony of beating the bounds was one of the peculiar modes of asserting the rights of the parish. It was often difficult to walk along the exact line on account of buildings which had been erected on it. The procession would sometimes enter a house by the door and emerge by the window; or wade across a canal; or penetrate dense thickets; or clamber over high walls; or swim a certain distance along a boundary river; or thrust a small boy into an oven, which it is to be hoped was cold. On one occasion in London, a private carriage was standing on the line; the coachman refused to 'move on,' whereupon the whole procession walked through the carriage, in at one door and out at the other. The writer remembers many such perambulations in the metropolis; when the clergy, the churchwardens, the parish beadle in a portentous cocked hat, and the charity schoolboys (in Geoffrey Muffin-cap costume) went their round. The hilarious youngsters beat with white wands any stone or wall which had on it a parish boundary mark. The ceremony, however, lost both its meaning and its respectability in course of time; it became a rollicking holiday for the riff-raff of the parish, and the most steady inhabitants gradually frowned it out of existence.

The custom of the *flitch of bacon* at Dunmow is not the least curious among those which rural parishes present. Far back in the old days when there was a priory at Dunmow, in Essex, the monks made a promise of a flitch of bacon to any married couple who could take oath that they had never quarrelled nor regretted their union. Whether the bachelor monks only intended to encourage conjugal harmony, or whether they satirically believed that married folk never do live together twelve months without discord, we can guess as best we may. At anyrate the successful applicants for the flitch were few and far between. The priory was suppressed at the Reformation, but the old custom survived, the flitch being given by the lord of the manor. In the last century the ceremony was conducted with much parade. The couple appeared at a court baron; a jury of unmarried

persons heard the averments; and if the results were satisfactory, a verdict was given—to the effect that the couple had been married at least one year; that they had lived quietly and lovingly together; and that they were deserving of the promised prize. This verdict being delivered, the happy couple, standing near the church door, made a declaration, received the flitch, and were chaired in procession through the town. The lords of the manor by degrees declined to offer the tempting bonus; and the clergy viewed unfavourably some of the incidents accompanying the proceedings. Twenty or thirty years ago, a few literary men revived the ceremony at their own expense—more as a whimsical joke for that one occasion, than as a permanent custom. From time to time the local journals record an observance of the ceremony. There is reason to believe, however, that speculative trade is mainly concerned here; the flitch being provided by some taverner interested in bringing together a large assemblage of thirsty souls.

In the cheese-making district of Gloucestershire, a pleasant kind of characteristic harvest-home used to be celebrated annually. Three large cheeses were placed on a litter or barrow, decked with flowers and branches of trees. They were drawn through and about the parish, with music and rejoicing. In the churchyard the cheeses were removed from the litter, rolled three times round the church, conveyed back to the village, cut up, and distributed among the peasantry.

Many parishes have duties imposed upon them of so whimsical a character that one marvels how such a state of things could have arisen. But it is explicable on the theory of *endowments*. A man bequeaths money or land, the interest or rental of which is to be appropriated annually for some purpose mentioned by him. After many generations the affair becomes as much an absurdity as a benefit, in some cases very much more so. The City of London parishes present numerous instances of this kind; the parochial authorities being trustees for sundry small endowments. If they do not administer these funds in accordance with the written wishes of the donor, they may possibly though unwittingly be offenders against the law.

Take a few instances. The parish of St Benet, Gracechurch Street, is trustee for a bequest the annual amount of which—£7, 0s. 6d.—is not only small in itself, but has to be divided into mere dribbles—one portion for that parish, one for St Olave's in the Old Jewry, and three others for parishes in Essex, Herts, and Bucks; the donor having probably had some personal association with all these localities. The Ironmongers' Company are intrusted with the administration of ten pounds a year, to be given to St Benet's parish, Paul's Chain; and the parish authorities have to divide it into five portions, varying from sixteen to fifty-six shillings each, among an equal number of other parishes. St Botolph, Aldgate, enjoys the complicated bequest of 'one-fourth of two houses,' and another of 'three houses and three-quarters of ten houses.' Among the multiplicity of City endowments, either corporate, chartered, or parochial, there is one for releasing Christian captives from the corsairs of Barbary; another for giving a certain amount of *snuff* once a year to a certain number of poor women; a third to pay the bell-

ringers for ringing a merry peal on the anniversary of (not the birth but) the death of the donor's wife! What are the parochial authorities to do with such extravagances as these? Some of the purposes specified are now impracticable, some absurd, and some altogether out of harmony with the general current of English feeling in the present day. Little wonder if the trustees occasionally get out of the anomaly by paying for a savoury official dinner from the money thus strangely bequeathed. The Endowment Commissioners found records of the bequest of an estate bringing in three hundred and thirty-three pounds per annum; there were *eighteen* trustees, who spent fifty pounds once in three years on a visit to the property, winding up with a dinner. We may safely assert that the legislature will ere long sweep away many of these absurdities.

The parishes of London in the old days were linked together in one matter by the establishment of a *guild of parish clerks*. These persons, mostly young men with good voices, were the favourite performers in the mysteries or religious plays before the Reformation. Clerkenwell or Clerks' Well is believed to have derived its name from them. On the grassy slope rising from the eastern bank of the river Fleet (the great sewers and the Metropolitan Railway must say what now occupies the locality) were the Clerks' Well, the Skinners' Well, St Rosamond's Well, and many other pleasant bubbling springs of beautifully sweet and clear water. Near one of these, in the open air, the parish clerks played a Mystery for three days in the presence of King Richard II., his queen, and court. In the next century, the young clerks devoted eight days consecutively to performing the 'Creation of the World' and other mysteries. Previous to the recent wholesale demolition of streets and buildings, there was an old pump bearing an inscription commemorative of the doings of the guild of parish clerks near the spot.

Some of the parishes of Wilts and Dorset still keep up the old custom of *Lent crocking*, one among many remains of Lenten usages in earlier days. The boys, marshalled into small parties, arm themselves with what broken crockery the dust-heaps can yield. A leader, going from house to house, knocks at the doors, appeals to the inmates, and sings doggerel lines announcing the fact that the boys have come a-shroving, and will expect gifts of pies, dough-nuts, cheese, bacon, and other toothsome titbits. If these good things are not forthcoming, the leader brings on his phalanx of boys, who administer to the door of the house a thorough bombardment with the broken ware.

The parish of Garrat in Surrey was for many years the scene of a custom strange and whimsical enough in all conscience. An encroachment on the rights of commonage was, on one occasion, successfully defeated by the parishioners, who chose one of their number as chairman of a committee for that purpose. A general election happened to be going on about the time; and some wag proposed the idea of electing a mock *mayor of Garrat*, the elected dignitary to remain in office as long as the members of parliament. The tavern and beer-shop keepers relished the scheme highly, for the ceremonial would infallibly lead to custom. Public attention was

drawn specially to the subject in 1747, when Willis a waterman and Gubbing a publican competed for the honour of the mayoralty. A town-hall, clerk, and recorder were improvised for the occasion, and the proceedings were conducted in mock-heroic style. The best candidate was considered to be the man who could 'drink largely, feed vigorously, head a mob majestically, and hurrah eloquently.' Willis, under the assumed cognomen of Squire Blowmedown, won the election. Seven years afterwards, at the time of another general election, the Garrat men closely imitated the parliamentary partisans, fighting the battle as keenly and as noisily. Again, seven years more passed, and no fewer than nine candidates contested for the mayoralty. The wits of the day entered into the jest so heartily, that Foote, Wilkes, and Garrick wrote some of the electioneering addresses. Foote produced his farce of *The Mayor of Garrat* after taking part in this anomalous election. It soon became known that his characters of Matthew Mug, Snuffle, Lord Twankum, Crispin, Heeltap, and Kit Noisy, were caricature portraits of some of the candidates. Another seven years brought on another general election, and with it the mock election of a mayor of Garrat. Seven candidates appeared, most of whom assumed the titles of lords and baronets. Some of the mayors elected at these septennial intervals were very popular; especially Sir John Harper (a breeches-maker), Sir Jeffrey Dunstan (a dealer in old wigs), and Sir Harry Dimsdale (a mullin-man). Sir Jeffrey, who was elected to no less than three septennial mayoralties, was a fellow full of wit and drollery. So great was the public enjoyment of these extravagances, that on one or two occasions the whole line of road from London to Garrat (Garrat Lane still exists) was crowded with vehicles, equestrians, and pedestrians, all bound for the election. The absurdity died out with the last century; a revival was once attempted afterwards, but failed.

Enough. The old customs which we have glanced at in rapid succession are illustrative of a much larger number than most of us would suppose. There are few parishes in England but would, by an appeal to the memory of aged persons, tell of such.

#### ART IN MANNERS.

As there is all the difference between good manners and bad manners, culture and no culture, good address and indifferent, we purpose inquiring in what way Art can help us in this sometimes neglected acquisition. Art should have as large a share of consideration in the cultivation of manners, as in personal adornment, or in the higher accomplishments. A face may be fair to look upon, yet the picture may be totally spoiled by an ugly framework of ill manners. Civilised society has laid down certain rules, to which all its members, consciously or unconsciously, conform; and the more these rules are observed, the better claim they give to refinement. As the social scale ascends, the more definite and imperative these unwritten laws become, until, in the highest circles of all, they rule with a despotic sway. We do not possess a 'Ritual'

or 'Academy of Manners,' as do the Chinese; but under the name of Etiquette we have laws equally binding. Nor are these confined to civilised nations. Savages have their manners and customs, however uncivilised they may appear to us, but it would not be thought friendly, much less good-breeding, to pull the fingers of those we salute till they crack, as do some negro tribes. A curious account is told of two dusky monarchs, who, when making a visit, greeted each other by snapping three times the middle finger. Although this is an example of two kings, it is scarcely worthy of imitation. Some savages take the hand or foot of him they salute, and with it gently rub their face—this must be rather wearisome to a devoted monarch—while others vigorously apply the nose against that of the person they are greeting. Other salutations are equally inconvenient and painful, and would require some practice to enable a stranger to be polite in the society of such eccentric pagans. Herbert Spencer has shown that there is, nevertheless, always a reason for these strange customs.

Still, etiquette is necessary in royal palaces for keeping order at court; though in Spain it was carried to such lengths that it made martyrs of their kings. One of them was once seated by the fireside; the fire-maker of the court had kindled so great a quantity of wood, that the poor monarch was nearly suffocated with heat, yet his dignity would not suffer him to rise from his chair; nor could the domestics presume to enter the apartment, because it was against etiquette. At length a courtier appeared, and the king ordered him to damp the fire; but he excused himself, alleging that he was forbidden by etiquette to perform such a function, for which a brother-noble ought to be called upon, as it was his business. This nobleman was unfortunately away from the palace, and the fire burnt fiercer; yet the king endured it rather than lessen his dignity. The result was, that His Majesty became heated to such a degree, that fever set in the following day; and he died as a martyr to the rules of etiquette.

A great deal has been said and written lately about Culture; and yet, on the other hand, the fashion to be a plain-spoken person seems to be growing. This endeavour to cultivate a somewhat rough honesty generally ends in downright rudeness, and certainly does not come under the head of culture. All honesty in the expression of thought is to be highly commended, when an opinion is asked; but there is no use, nor can it be desirable, to intrude uncongenial thoughts, or disagreeable opinions when not wanted, for no other reason than to display the courage of expressing them. True politeness is a consideration shown to the feelings of others; not only outward polish, but kindness in small matters. Especially should courtesy and attention be shown to the aged. They should always command respect and veneration, even if their notions are exploded

and old-fashioned. Human nature is so many-sided, that offence is easily given; but it would be quite as easy to avoid doing so, by giving a little more attention to Art in Manners. It is not desirable that all should be brought down to one polite unmeaning level. As in the art of painting, a perfect picture has its light and shade justly balanced, so it should be in our bearing towards others. And in the sister art of music, there is a *crescendo* and a *diminuendo*, giving variety without destroying the harmony. This can be done without any loss of manly or womanly independence.

As manners can only be considered from a social point of view, conversation will necessarily occupy a prominent place; and to excel in this art, it is essential to be a good listener. People are generally more anxious to speak than to listen. They are frequently thinking of what they are going to say, rather than of what is being said; and even those who are most polite, very often fancy it is sufficient if they seem to be attentive; and yet at the same time their eyes betray an absent mind, and show an impatient desire to continue their own train of thought. When listening, the attention should never be engrossed by any ideas but those of the speaker. Another important element is the art of saying the right word in the right place, a difficulty which seems insuperable to many, and which really is greater than appears at first sight. When listening to the cares and troubles of others, it is scarcely gracious, and certainly not comforting, to give a long list of similar grievances. Nor is it polite, when a friend is shown a painting, sculpture, or other work of art, for him instantly to describe a similar thing, only more valuable, that he has seen elsewhere, or possibly has in his own possession. Several instances might be given of saying the right word in the right place; but one is sufficient. For a host or hostess to introduce subjects with which they know their friends to be familiar, is a delicate attention, which may pass unnoticed at the time, but will have the good effect of making their guests feel at their ease, and leave a pleasant recollection, as every one likes to talk upon a subject on which he thinks he can talk well. Good-humour, or the habit of being easily pleased, is essential to politeness; but as there are often occasions when annoyances will arise, irritation may be concealed by a little attention to Art in Manners, and thus prevent the discomfort being felt by others. Cheerfulness, which is another requisite, enables its fortunate possessor to make the best of circumstances. A gloomy or melancholy individual never loses his self-consciousness.

Manners should be to a man what colouring is to a picture, nothing clashing or contrary to good taste, but all beautifully blended in one harmonious whole. Such a result cannot be obtained by mere outward polish. Its root lies deeper, and springs from the soil of the heart. As our bearing towards others is guided and shaped by the feelings, the cultivation of charity greatly helps to tone down or modify any rough or uncouth manners. Politeness may be a social virtue, but it can only be true and sincere when springing from refinement of mind. Kindness

of heart will cause its influence to be felt in a gentle bearing towards all; and the secret of Art in Manners may be found by acting on the principle of making every one as happy as lies in our power.

## THE FAMILY DIAMONDS.

### CHAPTER II.

EARLY the next morning, a message arrived from the Cottage. 'Mrs Missle's love to Miss Patience Missle, and she will be ready to see her at eleven.'

Punctually to the hour, I knocked at the door; but although the church clock had not finished striking, Robert and Martha had already arrived. They had each received a similar message to mine; and there the three of us sat in the small front sitting-room, patiently, yet anxiously, awaiting our relative's appearance. We talked constrainedly and in a whisper; but not a word was said about the events of the preceding evening, although I could see very well that the eggs and the peaches were sitting heavily on their minds. After we had waited a few moments, the door opened, and Aunt Purpose entered. She was a diminutive and withered-looking old woman, and, with her shrivelled yellow skin, and black, twinkling, bead-like eyes, not unlike a bird, as Mary had said. She was dressed in a pale lavender silk dress, with a large white shawl thrown across her shoulders, fastened in the front with an enormous gold brooch, containing a miniature of Uncle Job. A front of black hair, done up into little corkscrew curls at each side, showed from beneath the frill of a cheap, fanciful-looking cap, made up out of common white net and scraps and ends of not over-clean white satin ribbon; and her lean, shrivelled, wrinkled hands were covered with long black mittens.

'Dear Aunt Purpose!' cried Martha, emerging from her usual apathetic placidity as she demonstratively, and with unnecessary fervour, kissed her on each cheek.

'Exactly as I have ever pictured my uncle's wife!' exclaimed that hypocrite Robert, seizing her two hands in his and warmly shaking them.

'I am Patience, Aunt,' I said; 'and you see, I am trying to act up to my name.' This was said with a smile, but it was meant to be ironical, and as a hint to Robert not to hold her hands so long. Seeing, however, that he persisted in monopolising them, I stretched forward, and clasping her right hand over his, gave it a loving squeeze.

'Thank you, my dears,' said the old lady as her bright eyes twinkled at us all in turn. 'Your welcome is very warm.'

'Allow me,' With gushing politeness, Robert wheeled out an arm-chair, in which she seated herself; while Martha sank on to her knees and, with a tender little deprecating movement, arranged a stool for her feet.

As soon as quiet was restored and their fulsome attentions had come to an end, she turned to us; and at once we all became attentive. I confess it flashed through my mind that she was about to say something about the diamonds, and I know Robert thought the same, for such a greedy, grasping look came over his face; but no: it was only to thank us each separately for our little

gifts. Martha sniffed, and looked sheepishly at me; and Robert gave me an unkindly triumphant glance when Aunt added: 'Your *blanc-mange* was very useful, Patience.' ('Corn-flour shape,' I heard Martha mutter beneath her breath in a perfectly audible whisper; but Aunt did not heed her.) 'Poor Ayel [the black servant] had it for her supper,' she continued. 'She enjoyed it so much. She doesn't take very kindly to the European mode of living.'

How thankful I felt that I had taken the precaution of skimming the milk before making it! We sat there for a long time talking upon different subjects; but not a word, or a hint even, escaped her about the diamonds. I was impatient to go, and sat, speaking metaphorically, on tenter-hooks, for I knew that Mary would let the beautiful little loin of lamb, that I had got in for dinner, burn; but I did not care to be the first to rise; and then Martha and Robert had both behaved so treacherously to me, that I did not think it quite prudent to leave them there alone with Aunt Purpose. I sat on, and so did they, for they seemed quite as reluctant to leave as I did. At last Aunt solved the difficulty by pleading fatigue and dismissing us all at once.

'If there is anything that I can do for you, Aunt,' I said as I rose to go, 'I shall be only too happy to do it.'—'At any hour of the day or night, I am at your service,' interposed Martha with a sweet smile; while Robert bowed impressively. 'Myself and all that I have are at your command,' he said with one of his best company airs, that seemed to me to be not only ridiculous, but out of place with a relative. He did not have everything quite his own way, though; for as we passed out through the porch, I was enabled to point out to him the green parrot just finishing one of his prized nectarines. He turned away from the harrowing sight, and I heard him murmur to himself: 'Sixpence literally thrown away on that beast of a bird!'

The three of us walked on in silence until we reached the bend in the road where Martha would have to part from us. 'She must be quite seventy,' exclaimed Robert thoughtfully. 'I am sure her liver is affected; and with that jaundiced look about her, I should never be surprised at her death. There's a look of suffering about her face that reminds me strongly of old Thornton. You remember he died in less than six months after he came to England.'

'Poor dear!' sighed Martha pityingly. 'I am sure I don't wish her to die; but if she's to suffer much, it would be a happy release.' Both Robert and I echoed her pious fervour. We felt quite at peace with her; but it was really provoking that she had not mentioned the diamonds.

Robert's prognostication was fulfilled sooner than we had expected; but it was bronchitis, and not jaundice, that took her from us, her Indianised constitution not being able to stand the severity of one of our Nettlethorpe winters. She was attacked quite suddenly, and was dead in a few hours. We were all three of us in the house shortly after she had breathed her last, Robert making himself dreadfully officious.

'I am the executor,' he said pompously. 'Aunt Purpose told me so when I was here yesterday.'

Martha's face elongated at the news, and so did

mine. 'They're left to him, depend upon it,' she said after he had left us to institute a search for the will.

During all the time that she had been at Nettlethorpe, Aunt Purpose had been most tiresomely reticent about her jewels. We all, at different times, had tried to sound her on the subject; but she never satisfied our natural and pardonable curiosity, by responding to our hints; and we had been afraid of pressing her too much, for fear of offending her. Our attempts had been so unsuccessful, that we had begun to declare their existence to be a myth, until our confidence had been restored by Robert, who, by dint of great patience and perseverance—for her English was almost unintelligible—had managed to elicit from Ayel that the great Maharajah's present was an actual fact, and that her mistress kept it in a small leather case in her bedroom. Aunt Purpose had treated us all so much alike, that not one of us had a real clew to who had been her favourite. I knew that both Martha and Robert had been most assiduous in keeping her supplied with new-laid eggs and fruit and vegetables; but I did not think that their gifts had been appreciated more than my delicate little custards and puddings, for she always thanked me for them so kindly.

My ruminations were disturbed by Robert's return to the room. In one hand he carried an old leather case, very much worn, which he placed on the table, and in the other, a formal-looking document, fastened together with a wafer, with 'My Will' written on the outside in Aunt Purpose's small but clear handwriting.

'Read it, Robert,' I said in a faint voice.

He was very pale, and in his agitation, his hand shook a little as he broke the seal and unfolded it. Then, with a severe look at Martha, who had just heaved a ridiculous little sigh, he began. It commenced by naming him as the sole executor, and requesting his acceptance of the sum of five guineas for his trouble in acting as such. The furniture was to be sold; and after the funeral and all other expenses had been paid, the balance was disposed of as follows. (I now quote the words of the will.)

'And whereas, since I have lived at Nettlethorpe, my nephew and nieces have been very kind and considerate to me, and have at different times made me various presents of eggs, fruit, puddings, and other like articles; and whereas I know that none of them is what the world would call wealthy; therefore, I have kept three books, into each of which, under the name of the donor, I have duly entered each present, together with the date of its receipt, and that which I estimated to be its then marketable value; and it is my will that my executor shall cast up these totals, and out of the said balance in hand, pay to himself and my two said nieces such respective sums as the value of their presents at the time of my death shall have amounted to.'

'Most just and equitable!' exclaimed Robert, as he paused for a moment.

'And so beautifully expressed,' added Martha, throwing herself back in her seat and closing her eyes. 'Pray go on. It is just like a sermon.'

'Ahem!' coughed Robert, clearing his throat before resuming his task. 'My nephew and nieces,' he proceeded to read, 'have often expressed a kindly solicitude about the jewels

presented to me by the Maharajah of Baroda, and for which I now thank them. As I have no wish to show any preference for one above the others, and as it would destroy the set if divided, I hereby direct that my said nephew and nieces shall draw lots for them; and to the one who shall thus win them, I give and bequeath the said jewels absolutely.'

The will then gave directions about Ayel being returned, free of expense and with a small sum in her pocket, to her native land; and as to the 'rest, residue, and remainder of her property, whatsoever and wheresoever,' it was to be divided among the three of us, share and share alike.

It was, as Robert had remarked, a most just and equitable will; and we were all, on the whole, satisfied with it.

Martha was the first to speak. 'Shall we draw lots at once?' she asked timidly.

'Let us look at them first,' I suggested.

Robert had found a small bunch of keys, and after trying several, found one that fitted the lock. Oh! how our hearts beat as the key turned with a sharp little click, and he slowly and carefully raised the lid. Both Martha and myself rose and leant over him, and then our mouths and eyes opened as wide as the case before us. It was empty! The jewels were gone! A hundred different suggestions to account for their absence arose to our minds. There must be a secret drawer; they must be in some other box. All search, however, proved worthless. The rooms and every likely receptacle in which they might be hidden were examined, but not a trace of them could be found. At last we thought of questioning Ayel about them, and then we discovered the solution of the mystery. Ayel had not been seen since her mistress's death. She had disappeared—so had the jewels. She must have stolen them. Robert, who, I must confess, is a thorough man of energy and business when once he is aroused, lost no time in communicating with the police. He had not much confidence in the local constabulary; so, leaving me in charge of everything, he at once started for London to place the matter before the officials at Scotland Yard. I bore our trouble, I flatter myself, with becoming dignity; but that weak Martha utterly broke down. She went maundering about the place, bewailing and lamenting the loss, as if the lots had already been drawn and the jewels won by her.

## MONKEYS IN CONFINEMENT.

REMOVED from their native land, separated from their kindred, and imprisoned in cages, where they are subjected to the gaze and teasing of strangers, is it surprising if monkeys display some of the viciousness of humanity? Is it wonderful if some of these silvan creatures in such a case become morose, spiteful, or even revengeful? Is it just that the failings of those individuals should be deemed characteristic of the whole monkey race? It is hoped that the record we have to show will prove that, even in such trying circumstances, monkeys in confinement are not wholly destitute of good qualities. Observation proves that the curiosity, petulance, and mischief so frequently ascribed to these creatures in general, are as foreign to some tribes, as are repulsive habits and ferocity common to others. Most apes

are naturally gentle, grateful, and affectionate, even towards their jailers, and although when teased they grow sullen or peevish, they can rarely be provoked to violent passion. Generally, they wear an aspect of melancholy; due, doubtless, to the unnatural circumstances in which they are placed; but their eyes are bright, and their looks full of intelligence. The gravity and deliberation with which they act are most impressive, and cause one to regard with a kind of respect the opinion prevalent among many uncivilised peoples that monkeys can talk. Thus, a contributor to *Lippincott's Magazine* for 1873, writing about Java, says: 'The Sultan of Djokjokarta entertained us by the exhibition of a curious collection of monkeys and apes. Some were of huge proportions, full four feet in height, and looking as fierce as if just captured from their native jungles. The orang-outangs and long-armed apes had been trained to go through a variety of military exercises; and when one of us expressed surprise at their seeming intelligence, the Sultan said gravely: "They are as really men as you and I, and have the power of speech if they choose to exercise it. They do not talk, because they are unwilling to work and be made slaves of." This strange theory is generally believed by the Malays, in whose language *orang-outang* is simply "man of the woods."

Darwin mentions an anecdote, strongly illustrative of our contention, that the characters of monkeys are as varied as those of men. 'A man who trains monkeys to act,' says the eminent naturalist, 'used to purchase common kinds from the Zoological Society at the price of five pounds each; but he offered to give double the price, if he might keep three or four of them for a few days, in order to select one. When asked how he could possibly so soon learn whether a particular monkey would turn out a good actor, he answered that it all depended on their power of attention. If, when he was talking and explaining anything to a monkey, its attention was easily distracted, as by a fly on the wall, or other trifling object, the case was hopeless. If he tried by punishment to make an inattentive monkey act, it turned sulky. On the other hand, a monkey which carefully attended to him could always be trained.' 'To what a close imitation of the manners of human beings monkeys can be trained, is pretty generally known. Mrs Lee gives an account of one which a Parisian had taught to behave with great reasoning powers. She states that she suddenly met this monkey one day as he was coming up-stairs to the drawing-room. He politely made way for the lady, standing on one side, and as she said, 'Good-morning,' took off his cap, and made her a low bow. 'Are you going away?' she inquired. 'Where is your passport?' Whereupon, he took a square piece of paper out of his cap, and showed it to her. His master now appeared on the scene, and told him the lady's dress was dusty; when he instantly took a brush out of the man's pocket, and raising the hem of Mrs Lee's gown, brushed it, and then did the same with her shoes. His docility and obedience were perfect. When given anything to eat, he did not cram it gluttonously into his mouth, but ate it delicately; and when given money, he carefully handed it to his master. All this, of course, was the result of education. But this monkey was by no means the sole mem-

ber of the race found capable of instruction, as many similar cases can be cited. And surely they know what their actions signify. The author of *Salad for the Social* says that a friend of his possessed one of these little exiles whose disposition was very affectionate. When it had done anything wrong, and was scolded, it would immediately seat itself on the floor, and clasping its little hands together, beg earnestly, in its dumb manner, for pardon.

But our records show that these poor tormented creatures possess good qualities, and can perform really noble actions—from innate goodness, quite irrespective of education. Darwin furnishes most conclusive evidence of this in a story he tells. A keeper in the Zoological Gardens, whilst kneeling on the floor of the cage, was suddenly attacked by a fierce baboon. A little American monkey, which was a warm friend of the keeper, lived in the same compartment with, and was dreadfully afraid of the great baboon. But as soon as the poor little fellow saw his friend the keeper in peril, he rushed to the rescue, and by screams and bites so distracted the baboon, that the man was enabled to effect his escape, not, however, without having run great risk of losing his life, according to the opinion of the surgeon who attended him. Monkeys have long memories, and some of them can inflict cruel punishment. Mrs Lee tells of having greatly annoyed one in the Jardin des Plantes, at Paris, by tapping him on his hands for ill-treating one of his fellow-prisoners, and he never forgave her. Whenever he saw her on future occasions, or even heard her voice, he flew into a passion, and rolled about in rage, in one instance seizing her gown through the bars of his cage and tearing a piece out of it, although it was of stout material. Of another monkey, whose place of exile was in the West Indies, a crueller revenge is known. This individual, kept tied to a stake, was often robbed of his food by the crows. This was how he revenged himself. He lay quite still on the ground and pretended to be dead. By degrees the birds approached and repeated their thefts. The artful little fellow never stirred, but let the crows steal to their hearts' content until he was sure of them. When he was certain that one was within reach of his fingers, he made a grab at it and caught it. When he had got hold of the luckless bird, he sat down and deliberately plucked the feathers out of it, and then flung it towards its screaming comrades, who, for reasons best known to themselves, immediately surrounded it and pecked it to death. 'The expression of joy on the animal's countenance,' says the witness of the affair, 'was altogether indescribable.' Happily, most of these prisoned 'men of the woods' are better natured; and so deeply attached to each other, that if one die, its companion—should it have one—almost always dies of grief. The *Standard* for February 1859, stated that 'the cat-faced monkeys from New Granada had died within a few days of each other; the female from inflammation of the lungs; and the male, apparently from grief, as, after the death of his companion, he refused all food. These models of conjugal tenderness were at the Jardin des Plantes for seven years.'

The strong affection monkeys bear not only for each other, but for their owners, or even for any animals they have to associate with, is well

known. Monsieur Relian, a surgeon resident in Batavia, in an interesting account he has given of two orangs which were leaving for Europe, says: 'They were of the human size, and executed all the movements which men do, particularly with their hands. Both were very bashful when you looked fixedly at them, and the female would then throw herself into the arms of the male and hide her head in his breast. This touching sight I have witnessed with my own eyes. They did not speak, but uttered a sound similar to that of a monkey. They are called "wild men," from the relation which they bear in outward form to the human species, particularly in their movements, and in a mode of thinking which is certainly peculiar to them, and which is not remarked in any other animals.'

When deprived of the society of individuals of their own tribe, monkeys appear to turn instinctively to that of human beings, in preference to the companionship of other animals. They have their likes and dislikes, however, for certain members of the *genus homo*, preferring, if possible, to associate with persons from their own quarter of the globe. Mr George Bennett, speaking of a Malay monkey that had been given to him, and which had succeeded in freeing itself from the cord or chain by which it had been fastened, says that as soon as he had obtained his liberty, he walked in his usual erect posture towards some Malays who were standing near the place, and after hugging the legs of several of them, without, however, permitting them to take him in their arms, he went to a Malay lad who seemed to be the object of his search; for, on meeting with him, he climbed into his arms, and hugged him closely, expressing both by look and manner his gratification at being once more in the arms of him who, it appeared, had been his former master. This lad had not properly reciprocated the poor creature's affection, for he it was who had sold it to Mr Bennett. Its screams had been very distressing; and its frequent escapes down to the water-side in search of the lad who had brought it from Sumatra, were the cause of much annoyance. When its original owner was not to be found, Mr Bennett had to get the temporary assistance of another Malay to take charge of it. Ultimately, it became quite docile, and free from those mischievous tricks ascribed to the monkey tribe in general. Mr Bennett brought it to Europe, and says that its mildness of disposition and playfulness of manner made it a favourite with all on board. It preferred children to adults and became particularly attached to a little Papuan child, 'whom it is not improbable he may have in some degree considered as having an affinity to his own species.'

The conformity to the requirements of society is something marvellous in the monkey tribe; resulting apparently from their wonderful faculty for imitation. A ludicrous instance of this power is related by Mrs Loudon. Father Casauban had a Barbary ape, which was so attached to him, that it tried to follow him wherever he went. One day, when the reverend Father proceeded to church, the monkey contrived to escape from his fastenings, and silently followed his master. On arrival at the place of worship, the ape climbed up to the sounding-board, and lay there quiet enough until Casauban began his

sermon. Then it perched itself just above his head and watched his actions; and as the holy Father gesticulated, it mimicked his gestures to the best of its capabilities. The congregation tittered; and Casauban, shocked at the ill-timed levity, administered a severe rebuke, suiting his actions to his words, and being all the while most grotesquely imitated, so far as gestures went, by his silent pupil. This was too much for the congregation; a roar of laughter greeted the competitors, as some friendly person kindly pointed out to the exasperated pastor the cause of the general hilarity. Amusing as this anecdote is, it affords very little idea of the highly polished condition to which our monkey friends can be brought when in contact with civilised beings. Every naturalist can give instances. Buffon tells of a chimpanzee which 'always walked on its hind-legs, even when carrying heavy burdens. I,' he says, 'have seen this animal present its hand to conduct the company to the door, or walk about with them through the room; I have seen it sit at table, unfold its napkin, wipe its lips, make use of a spoon or fork to carry its victuals to its mouth, pour out its drink into a glass, touch glasses when invited, go for its cup and saucer, carry them to the table, pour out its tea, sweeten and leave it to cool; and all this without any other instigation than the signs or commands of its keeper, and sometimes even of its own accord. It was gentle and inoffensive; it even approached you with a kind of respect, and as if only seeking for caresses.'

The author of a work on Monkeys in the 'Library of Entertaining Knowledge' gives a very interesting account of a young chimpanzee that was purchased by the Zoological Society some years ago, after it had apparently imbibed many ideas from its human neighbours. 'Tommy,' as he was called, was from the regions of the Gambia, and when found, was in the company of his mother, whom the hunters 'were obliged to shoot before they could obtain possession of the young one.' Master Tommy, at the time the author observed him in the Zoological Gardens, where his cage was kept in a keeper's apartment, was about two years old, and quite unsophisticated by any showman's tuition. Two trees had been erected in his cage, and a rope suspended between them, to afford the youthful occupant the amusement of climbing or swinging; but he generally preferred to run about the floor of his cage, or amuse himself with visitors. In many of his actions, Tommy differed but little from the human species. 'He was without exception,' says our authority, 'the only animal we have ever seen that could leap, or jump upon his hind-feet, like man; and this feat he often performed, both on the floor of his cage and in descending from his tree. He frequently indulged, too, in a kind of rude stamping dance, perfectly similar to that of a child of three or four years old, only that it was executed with greater force and confidence. All this arose from the uninterrupted spirits and buoyancy natural to the infant mind. He was at all times cheerful, lively, and perpetually in motion from sunrise to sunset, either jumping or dancing, or cantering about his cage, romping and playing with the spectators, or amusing himself by looking out at the window!' Tommy was evidently better suited for walking on the ground than climbing

trees, and like his human friends, was particularly noticed to use his right hand in preference to his left. When told to seat himself in his swing, Tommy would good-humouredly do so, stretching out his foot to one of his visitors, to be set in motion.

Although he strongly objected to being made the object of a practical joke, Master Tommy was very fond of playing them off on others. The carpenter had to enter the cage to make some alterations, and Tommy availed himself of the opportunity to perform all kinds of tricks upon him, such as pulling his hair, snatching off his paper cap, purloining his tools, and even trying to trip him up, all the while assuming an aspect of the most innocent gravity, and only approaching when he deemed himself unobserved; the instant after he had perpetrated his joke, pretending to be interested in something at the other end of his cage. Finally, when the unfortunate carpenter happened to have his back turned to him, Master Tommy, unable to resist the temptation, gave him such a sounding box on the ears that the keeper had to interfere.

Another time, he got a small dog into his cage, and so tried its temper by pulling its ears and tail, that the poor brute showed an intention of retaliating; whereupon Master Tommy pretended to be highly indignant at his impudence, and with uplifted hand threatened to chastise doggie there and then. The young captive was very fond of being tickled, and flung his arms and feet about during the operation in an ecstasy of delight, his eyes twinkling, and his whole face convulsed with laughter. He had a great jealousy of children, and never lost a chance of pulling their hair, or clothes, or of scratching them. Although generally good-natured, he did not like to be teased or refused anything he had taken a liking to; then he would lose his temper, his face became inflamed with passion, and he uttered shrill and angry cries. He soon forgot his resentment, however, and in a few moments would recommence his games as if nothing had happened. His habits were extremely cleanly and decent; he would 'pick his teeth, clean his nails, and perform many other similar acts which have been generally considered as peculiar to the human species.' Other interesting anecdotes of Master Tommy's sagacity and natural shrewdness might be quoted; but doubtless enough has been said to show that after all deductions have been made for his powers of imitation, there still remained a large amount of real reasoning to be accounted for, and that, in fact, as his historian remarks, 'the nature of his mind seemed to differ from that of man not so much in species as in degree.' I.

## A CHAPTER OF REAL LIFE.

### TWO HOMES.

THERE was trouble on a certain morning in two homes at opposite ends of the city of Dublin. The homes were very different, and so was the nature of the trouble; nevertheless, the latter was felt with considerable keenness by the respective inhabitants of both.

The first of these dwellings was on the south side of Merrion Square, a goodly mansion, the abode of wealth and luxury. The lofty drawing-rooms, opening into each other by folding-doors

draped with velvet *portières*, were gorgeously fitted up. Buhl and *marquetry* in tables and cabinets; carvings, statuettes, bronzes; brackets and *étagères* heaped with rare old china and objects of *virtù*, reflected and multiplied by Venetian mirrors and looking-glasses in Florentine frames; couches and chairs of every luxurious shape, satin and velvet upholstered. Draperies of antique lace were arranged with picturesque effect among gilding and brackets; costly toys lay scattered about the tables among vases filled with hothouse flowers in lovely profusion, that made the rooms sweet with their fragrance.

The lady to whom all this belonged sat disconsolate in the midst of her rich surroundings. Books and embroidery were on the dainty little flower-decked table at her side, but they were untouched; and a restless, troubled expression was on her face while she nervously clasped and unclasped the jewelled hands lying idle in her lap.

The door opened, and a footman announced a visitor.

'Oh,' she exclaimed, rising to greet her, 'you got my note. How kind of you to come! I am in such distress.'

'And for what?' asked the friend. 'Tell me all about it.'

'You remember my cousin Emma H——?'

'Of course. But no one has seen her for years. She has shut herself up in her country place ever since her husband died; has she not?'

'Yes; and she is still a prey to grief. Before they married, her husband gave her, as her engagement ring, a valuable jewel that had been in his family for time out of mind, and had come to him from his mother. It was a diamond—a single stone of great size and the purest water. Of course she valued it immensely, as indeed she would have any gift of a man to whom she was so devoted. Since his death, this ring has been simply inestimable in her eyes—the earnest of happiness ruined so soon. Prized so highly by the giver as an old family possession, and in itself of such exceeding value, it has never left her finger day or night. Latterly, she has fancied that the stone was becoming loose in the setting, and spoke of sending the ring to me to have it examined by a jeweller, but could never make up her mind to part with it, even for a few days. At last, however, the stone came out. She sent it to me, and'—here the speaker broke down—'I have lost it!'

'You have lost the stone? How very unfortunate! No wonder you are so wretched. Tell me how it happened.'

The lady told her story, pouring the details of the grievous misadventure into sympathetic ears. Her friend, with kind tact, abstained from the, 'If you had only done this or that;' or, 'I wonder you did so-and-so,' common on such occasions; remarks that drive painfully home the arrow of self-reproach and fruitless regret, already stinging so sharply. Every one is so wise, so full of precautions, after a thing has happened.

The means that had been adopted for the recovery of the lost treasure were discussed by the two ladies, and fresh measures anxiously suggested. At last the visitor departed, leaving the owner of these gorgeous drawing-rooms with a heavy heart under her 'silk attire.'

The other home was in a very different quarter of the city. It consisted of one room in a house let out in 'tenements' to poor families, in a squalid back slum. The place was clean, though bare of everything except mere necessities; every article of furniture that could be dispensed with, as well as the wearables of the inmates, having gone to the pawn-shop to procure food. Lying out-side the bed, partly dressed, was a man—the wreck of a fine, stalwart, broad-shouldered young fellow. He was a day-labourer, and had lately left the hospital after a long and heavy fit of illness. Two small children were playing quietly in a corner; and the wife—her apron thrown over her head—was sitting beside the fireless grate, rocking herself backwards and forwards, sobbing bitterly.

'A' don't take on so, my girl,' said the man—'don't now, Mary, honey. Sure God is good. Maybe He'll rise up something for us. I'll get strong and able again perhaps. Didn't the doctor say when I was leaving the hospital, that I hadn't a ha'porth the matter with me? I was cured; and he need do no more.'

'Ay; and didn't he say too that you was to have good food—good nourishment; and that without it you wouldn't do? And 'tis that what's breaking my heart entirely,' added Mary, with a fresh burst of grief; 'looking at you there melting away before my eyes day by day; wore to a skeleton with next to starvation, and nothing on the living earth to give you. And now here's the man come for the rent, and I haven't a half-penny to give him—not one! Sure and certain, we'll be turned out on the world. Nothing for it at last but to go to the workhouse, and be all parted asunder from one another—you and I and the children. And we so comfortable, so happy in our little home before you took ill, with full and plenty of everything! Oh, Jim, jewel, isn't it hard?'

'Well, 'twas from no fault of ours, and couldn't be helped. The sickness came from the Lord—glory be to His holy name! How do we know but what help will come from Him too? Anyway, darlint, there's no use in fretting.'

'If I could get work, I wouldn't fret,' said the young woman. 'We might struggle on, and keep the life in us till such time as you were on your feet again. But I can't. It's a poor case to be able and willing to earn, and not get it to do. The last job of needlework Miss West got for me—she's a good friend, heaven bless her!—was well paid for. She promised to try and get me more amongst her ladies. I'll go off to her now, and see has she heard of anything.—You'll be good, avourneens, while I'm away, won't ye?' said she, kissing the two half-starved mites in the corner; 'an' ye won't cry, or disturb the poor sick daddy.—I'll be back, Jim, my heart, in less than no time.'

Faith in Divine help and patient endurance of suffering are traits well known to those whose experience lies among the lower orders. Poor Jim had a full share of both; nevertheless, when his wife had gone, he broke down miserably. 'God help her!' he said, looking after her retreating figure; 'and God forgive me for deceiving her, and making up stories about getting strong and well, when I know as sure as that I'm lying stretched here, that the never a

stroke of work I'll do again in this world. 'Tis dying I am—dying for the want of everything; as weak as water, and not able to lift my head. If she was to slave day and night, and work her poor fingers to the bone, the craythur! she couldn't get me the nourishment I'd want. Though I putend to her that I'm not one bit hungry or inclined to make use of victuals, I could eat the world if I had it. I'm just ravenous! When I was sick at the hospital, I wasn't able to look at even the cup o' tea; but now the hunger is gnawing and tearing at me. My heart is weak from fasting, and the longing and the craving are killing me.'

Meantime poor Mary was hurrying through the streets with anxious footsteps, speculating on the possibility of her friend having found her work among her pupils.

Miss West was a daily governess. Though but just nineteen, she was the main prop and stay of a widowed invalid mother and young sisters; earning by her daily toil that which eked out the pittance left of better days, and made by frugal contrivance the two ends meet. But none are so poor as not to be able to help in some way those worse off than themselves; and the young girl had pleaded successfully for Mary, and had procured employment that had been the only support of the poor family during Jim's illness. She was going to breakfast when her protégée was shown in; just preparing to attack, with the healthy appetite of youth, and the knowledge that many busy hours would pass before she should again see food, a goodly slice of thick bread-and-butter; the thickness, be it observed, referable to the bread only, the butter spread thereon being limited to an almost imperceptible 'scrap.'

'Ah, is that you, Mary?' she said with the bright, pleasant smile that always seemed, Mary declared, to 'rise her heart out of trouble.' 'I am afraid I have no orders for you this morning; but I have got a new pupil, and she tells me that there will shortly be a wedding in the family. So there's a chance for you. Needle-work may be required, and I may have good news for you before long.'

Poor Mary wrung her hands together under her cloak, straining them hard in the agony of the disappointment that she strove to keep down and hide from her young benefactress. Very bitter was the pang of deferred hope; but she would not seem ungrateful.

'And I daresay,' said the girl, glancing at the hite pinched face, 'that you've left home without your breakfast. Here's a nice cup of tea I've just poured out, and a round of bread-and-butter' [her own whole morning meal]; 'sit down while you take them.'

'Thank ye kindly, Miss; I'm double thankful for the tea; and,' added the poor woman, all unconscious that she was robbing her benefactress, 'as you're so good, I'll put the slice in my basket, and carry it to poor Jim. Maybe it'll tempt him—lovely white bread! He does be saying always that he has no mind to eat; but I think 'tis just puttending he is, poor fellow! He knows I haven't it for him.'

'If I could only get you some work!' said the girl, touched to the quick by the utter woe in her poor friend's face.

'Ah well, sure you're doing your best—the Lord

bless you!—and who can do more? And now, Miss, I'll go; axing your pardon for all the trouble I'm giving you.

With a heavy heart Mary turned away, retracing her steps wearily along the passage. Remembering something, however, before reaching the hall-door, she came back, and reappeared in the room where the little governess was tying her bonnet-strings, preparing to set out. 'I forgot this,' she said. 'Sure, I'm losing my mind entirely with the fret that's on it. God help me! my burden is making me foolish. Coming along this morning, I seen this on the flags, and put it in my pocket, thinking maybe if it was clean, one of your little sisters might fancy it for her curiosity-box.—Let me wipe the mud off it for you, Miss. It shines beautiful now—a bit of glass like.'

A moment's scrutiny of the object sparkling on the woman's outstretched palm, and Miss West crying out, 'Give it me, quick, and wait,' snatched it from her—Mary staring in astonishment at her vehemence—and rushed up-stairs to her mother's room.

'What is it, dear?' said the startled invalid as she dashed in. 'What ever is the matter?'

'O mother, look! Can this be what we saw advertised for in the newspaper? Is it possible poor Mary can be the lucky finder? I can scarcely believe it. Do look.'

The advertisement was as follows: '£50 REWARD. Lost, a valuable DIAMOND. [The description and further particulars given.] 'Whoever finds it, or can give information leading to its recovery, will receive the above reward by applying at No. —, Merriion Square, South.'

Mrs West at once pronounced what was submitted to her experienced judgment, to be a diamond of great value, and was strongly of opinion that it might be the missing jewel; but both mother and daughter agreed that it would be better not to tell Mary the extent of her possible good fortune, for fear of disappointment. So on returning to her, the young lady only said: 'My mother thinks this may be something we have seen advertised for in the newspaper, to be taken, if found, to Merriion Square. My first tuition this morn'ing happens to be in that square, so I will go with you to the house mentioned.'

'Thank ye kindly, Miss. The footmen in them grand houses wouldn't look at the likes o' me. They'd just slap the door in my face, if I made so bold as to ring.'

As she tripped along, the young governess's heart beat high at the prospect of what might be the happy result of her errand. No more slaving for poor Mary; good food for Jim; an airy lodging at the sea-side, where he would soon recover his strength; clothes and furniture redeemed from pawn; and after an interval of rest and ease—sorely needed after their sufferings—her humble friends restored to their old life of industry and comfort.

She might have been tempted to impart some gleam of these bright hopes to the poor grief-laden young wife plodding wearily behind her, had she seen the tears that dripped slowly down over her miserable face, or guessed at the gnawing thoughts that were driving her to despair. 'Dying! yes, dying before my eyes; and not one to reach a hand to save him! And he so young, and so

good, my darling Jim! Not like a many of the other boys, his comrades, with their feet ever on the floor of the "public," getting as drunk as drink can make 'em. Steady and industrious always; bringing his earnings to his little home, and that sober you wouldn't think he had a mouth on him! And now to be hid away from me for ever in the clay, an' myself and my two weenochs!'

— Poor Mary couldn't finish the picture; and soon her wretched reflections were put a stop to by their arrival in Merriion Square.

It is needless to dwell upon what followed when Miss West was shown up into the drawing-room, and displayed before the enraptured eyes of its occupant the precious jewel whose loss had caused such tribulation. As for poor Mary, it was some time before she could realise her good fortune, or take in the bewildering tidings of the wealth that had so providentially come to her. And Jim, what news for him! There was healing in the very thought of such prosperity!

So it came to pass that in the two homes clouded so lately with trouble and anxiety, peace of mind was restored. Heaviness had endured for a night—a long weary night in one case—but joy to both had come in the morning.

## AN HOUR WITH A FARMER OF THE OLD SCHOOL.

### APROPOS OF A CERTAIN GREAT SHOOTING-MATCH.

'WELL, sir, I be main glad to see you, to be sure; and I thinks it kind on you to drop in to look at an old lonely man like me, that I does. Take a cheer and set yourself down; and what'll you please to take to drink?—not have a pinch of snuff? You'd rather have a pipe? Well, sir, do. No. I don't smoke myself, but I does like a shift of snuff. Talking about snuff, I re-collects as there was a inquest held in our village a goodish many year ago; and when the coroner come, he weren't in a particular good-humour, and found fault with this and that, and snapped like any-think first at one and then another, till I thought he was agoin' to give us jury-men a jacketing all round. Well, I wanted a pinch sadly myself, but was a'most feared to have one, he were that snappish; so I watched my opportunity, and slipped my thumb and finger into my weskit pocket, and took a little bit ever so quiet like; but, lor' bless us, he see me do it, and turns round and says: 'Didn't I see a man as has some snuff about him?' Thinks I, I be goin' to ketch it now for contempt of court, or whatever they calls it; but to my surprise he says: 'I should be much obliged if he'll give me a pinch.' So I gives it him; and when he'd took it, lor'! he was that affable you wouldn't think, and the inquest went off as pleasant as could be. So you see, sir, there must be summut in snuff after all; and I suppose in 'bacca as well. A goodish many clever men was snuff-takers, though I bain't one myself—only a dolder-headed old farmer. Look at Bony-party! He were a great man, weren't he, now? and he took snuff like a house-a-fire, so I've heard tell, especially when he'd got any big job, like, on.

Does I shoot now? Well, you see, sir, I bain't quite so young and lissom as I'd used to be; but I never misses the First o' September. But lor'

bless me, there's so many lazy, idle vagabonds about the place now, too lazy to work for fair wages since these 'ere Unionists, or whatever they calls themselves, have been in these parts, that game is scarce; for they poaches anything they can lay their hands on. And then, again, the old Squire has been dead a many long year, and the land as he used to preserve ain't looked after now as it was in his time. A rare good sort he was to be sure! Ah! the times be altered, surely! Why, our new Parson have took it into his head to pull down all them good old-fashioned high pews in the church—where you could set and have a comfortable snooze if you didn't like the sermon—and have put in their place nasty low seats made of deal, so that everybody can see everybody else.

What call had he to alter 'em, I should like to know? Just as if old English oak—as the old seats was—wasn't good enough! But there! the young farmers' daughters, as dresses in the latest fashions, likes the change, because, I suppose, they can show their new bonnets and finery better. And then again, instead of the two flutes and big fiddle as we'd used to have, and the old-fashioned hymns and anthems, as everybody knowed and could jine 'in, he's got a 'ot of boys and wenches in the quire, as don't open their mouths when they sings, and you can't understand a word they says. And for music he's got a thing he calls a harmony—something or other, as sounds more like a orgin I once heard in the village street; and the worst of it is, *we've got to pay for it all*. I didn't want no change; oak pews and the big fiddle was good enough for me, and so they would have been for the Squire. And talking about him, puts me in mind of a rare bit of fun he and I and a few more had about thirty year ago one First of September. I always larfs when I thinks of it.

Well then, sir, there was a Cockney, as they calls them London chaps. Of course, sir, I don't mean no dis-respect to you, because, although you lives there yourself, you bain't exactly one of 'em, seeing as you was bred and born in our county. Well, he—this 'ere Cockney—come down here about one of these 'ere nasty railroads. No, sir, I never rode in one of them trains, nor I don't mean to as long as I can ride in my old gig; and when I can't no more, why, I'll walk to market. Well then, this 'ere Cockney was staying in the next village—the folks there call it a town, because it's a bit bigger than our'n—and the Squire, living as he did half-way between the two places, only about a mile apart, and being a hospitable, kind-hearted man, took notice of this 'ere Cockney, and asked him to dinner, and so on. A cleverish sort of chap he was, by his own account; and talk! Well, he *could* talk, for certain! He could do this, and that, and t' other; and made us all feel we was nobodies, and knowed nothing, and could do nothing.—Shoot! Why, nothing with fur or feathers could live, if it got up before *his* gun! At last, the Squire got on his mettle, and challenged him to go out with him on the First, and made an agreement with him for five pound a side who should make the heaviest bag; and whatever one shot, the other was to carry.

Well, there was a goodish party of us started, but only the Squire and Mr Cockney was to shoot; so about eight o'clock in the morning,

off we all went, and the Squire good-naturedly gave the Cockney first chance. Bang, bang, one barrel after t'other, he went; but nothing dropped. Then the Squire pulled trigger, and fetched down a bird with each barrel, for he was a fairish shot. The Cockney made some excuse for missing; but there, we could soon see he could do nothing, while the Squire hardly missed a shot; and as the bargain was that what one shot the other should carry, Mr Cockney towards lunch-time was very glad to be eased of his load. He made a good fight of it, however, and made up for his bad shooting by his talking. But by four o'clock, he had as much as he could well carry, and as the Squire always, like the sportsman he was, made it a rule not to shoot after this hour, we started for home.

The poor Cockney went staggering along with the Squire's bag; and I can tell you it was pretty heavy, and he looked regular done up, for it was a hottish day. Well, we had got pretty nigh home, and was going through the little paddock close to the Squire's house, and one had asked the Cockney if he could hit a hayrick or a barn; and such like chaff was going on, when we come across a goodish-sized calf as had been capering round the paddock, and all at once come and stood stock-still within a few yards of the Cockney, and was just going off for another scamper, when Mr Cockney turned sharp round, and let fly both barrels, one after t'other, bang! bang! and shot the calf dead as a hammer, and says to the Squire: 'Now, dang it, carry *that*.' Larf! Lor' a massy on us, how we did larf to be sure, and the Squire most of all, though he lost the wager; for you see, sir, the bargain was, that which of the two made the *heaviest* bag was to be the winner; and good as the Squire's was, the calf outweighed his'n. But there, he managed to get it up, but could hardly stagger under it for larfing.

So, you see, sir, the Cockney made up for his bragging by his 'enteness. It was a smart trick, wasn't it, sir? And I always larfs when I thinks on it.

## THE WY E.

(NEAR MONMOUTH.)

A LAND of hills and woods and yew-crowned rocks,  
All scarred and furrowed by primeval flood;  
With many a bastion, grim and bare, which mocks  
The anger of the storm-god's fiercest mood.  
Above, the oak stands as it long has stood  
Through Winter's tempests; and, adown, the green,  
The rich dark green of ivy that has wooed  
The time-worn limestone, trails; and all between  
The rifts and sheltered nooks, the fern's chaste form is  
seen.

Below, the slow, broad-curving river; here,  
The willows lie reflected in the stream,  
Placid and deep; and, there, the noisy weir,  
Where tiny wavelets in the sunlight gleam.  
Hard by, a loiterer, lying in a dream  
Upon the bank: far off, a bare hillside;  
And farther, boundless forest-growths which seem  
Most solemn and most calm, as far and wide  
They stretch majestic arms, in all their Summer pride.

## RAMBLES AMONG THE HILLS.

A HILL-COUNTRY in breezy, sunshiny weather, with a purpling gleam on the heather, and the scent of wild thyme and yellow clover in the air, with the windy masses of cloud chasing the changeful lights and shadows across the wide landscape, and sending straggling shafts of sunshine through the gleaming underwood of birch and hazel that line the banks of this brawling moorland stream—can anything be more charming? Who would not envy Mr Louis J. Jennings his *Rambles among the Hills*,\* or refuse assent to his proposition, that a more beautiful country than our own to stroll over is not to be found on the surface of the round globe; provided only that one can have the sun for a companion, for, of a certainty, gloomy skies and perpetual rain dull the rich tints of glen and moorland, and take the brightness out of the loveliest scenes.

In his walks, Mr Jennings preferred to leave behind him much-frequented routes, and chose for his rambles the region of the Derbyshire Peak and South Sussex Downs, because the ordinary crowd of tourists leave them alone, and there is really very little known about them. The best headquarters that can be chosen for an excursion into Derbyshire is Chatsworth. Its stately hall and beautiful park, its woods redolent of sweet scents and sweeter flowers, the subdued tint of the swelling uplands beyond, melting away into the far blue shadows of the Peak—all these are familiar to the multitudes who frequent Buxton. Maddon Hall, another of the lions of this favourite watering-place, offers a scene of peculiarly English beauty. Seen in the stillness of sunset, with the crimson light flecking here and there the grassy glades under the oaks and beeches, nothing can equal its tranquil beauty. But almost more interesting, because less of a show-place, is the ancient Hall of Hardwicke, built by Bess of Hardwicke, who was, by dint of her

successive marriages and jointures, perhaps the richest woman of her day.

Her third husband, the Earl of Shrewsbury, was one of the many jailers of Mary Stuart; and a great deal of old tapestry which still remains in the house, is said to be the work of the beautiful and ill-fated Queen of Scots. Bess, whose charms were more those of the purse than of the person, was jealous of her fair captive, and led the Earl such a wretched life on her account, that he complained bitterly to the Bishop of Lichfield 'that she had reduced him to the condition of a pensioner.' The good Bishop tried to console him by telling him 'that if shrewdness or sharpness may be a just cause of separation between a man and wife, I think few men in England would keep their wives long.'

A portrait of Mary hangs in the library of this home, to whose peace she was so fatal. It was painted just before her execution, and shows us a face from whose wan, haggard outlines the fresh soft beauty of youth and happiness have fled for ever. In the dining-room hangs a portrait of Bess herself, a hard, resolute, sensible face, but scarcely that of 'the sharp and bitter shrew' my Lord of Shrewsbury accounted her. By her side hangs a portrait of her second husband, Sir W. Cavendish. The grim, lonely castle of Bolsover was also a favourite residence of this oft-married widow; and here again is much beautiful tapestry, the work of the Scottish queen, whose industry at least ought to have commended her to her ungracious hostess.

The scenery of Dovedale, a favourite resort of tourists, is more distinctively striking than beautiful. The river Dove flows between steep banks, laden with a tangled luxuriance of hawthorn, mountain-ash, and bramble, with a gay undergrowth of wild-flowers—tall spikes of yellow snapdragon, clumps of white campion, crimson patches of ragged Robin, and starry clusters of fragrant woodruff, suggestive of newly mown fields of hay. By the river-side, embosomed in trees, is a little square cottage, built in 1674 by Charles Cotton, in which he entertained the prince of

\* London: John Murray.

anglers, and dear companion of all lovers of the gentle craft, Izaak Walton.

Through this country, with its snatches of picturesque scenery, its smooth stretches of river-bank, its woods of beech and oak, its tangled mazes of fern and brier and wild-flowers, and its undulating breadths of moor and common, our author was slowly working his way towards Edale and Kinderscout—the advanced guard of the picturesque array of heather-clad hills which surround the Peak. He has a weakness for by-paths, which has doubtless helped to his practical acquaintance with the varieties of vegetable and animal life to be found in morass, ditch, and peat-hag. On the occasion of which he speaks, darkness surprised him among the meadows by the banks of the Dove; and he emerged from them, after much devious wandering, such a wet, muddy, wretched-looking object, that he was surprised to receive a friendly greeting from the landlady of the *Charles Cotton Inn*. The kind hostess, undaunted by the mud and dirt with which he was incrustated, 'brought me,' he says, 'into the kitchen, where there was a good fire. She gave me a pair of socks, and told me they were accustomed to do this friendly turn for travellers who had been through Dovedale, and who almost invariably landed soaking wet. "We even lend them trousers," said the good soul. But luckily my case was not so bad as to call for so great a sacrifice.'

Morning among the hills, a fresh breezy morning, with a great flood of sunshine lying warmly on the purpling stretches of heather and the few buds which still linger on the wild roses. Early astir as every tourist should be, Mr Jennings has already climbed to the summit of Mam Tor, above and opposite the village of Edale. Here a view bursts upon the eye, 'to which it is,' he says, 'impossible to do justice. It may be doubted whether there is anything finer to be seen in England, for it includes almost everything which goes to form magnificent scenery, except water. To the north, the lovely Valley of Edale lies spread below, guarded by a range of hills at each end. On the other side is the almost equally fine Valley of Hope, with heather-covered hills stretching away for many miles. Fresh from a visit to Switzerland, it seemed to me that I had seen nothing more beautiful and attractive. If the Kinderscout range were in Switzerland, scores of books would have been written about it, and sanatoria without number would have been established on its hillsides.' Indeed, Mr Jennings is inclined to give the preference to this beautiful hill-region of Derbyshire. It does not suffer from the extreme heat of the Swiss valleys, and it is free from the insect pests, the mosquitoes and horseflies, of which all wayfarers in the Brunig Pass in July and August must retain lively recollections. The groupings and surroundings of these hills, the deep cleughs and valleys which intersect them, the picturesque torrents, with the fringes of copsewood which feather their banks, are indescribably beautiful. Charming under every aspect, whether seen shimmering indistinct and vast through the tender pale gray of the morning mists, or basking in the smile of noon, with the sunshine sending long shafts of radiance up the green sequestered valleys; or half in gloom, half in the dusk yellow light of declining day, when weird shadows fall athwart the long stretches

of heath, and fill with blackness the deep ferny glens.

From Edale Head the tourist can see for himself the true nature of the Peak. 'It is a mass of wild hills, with a sort of bog or moss-covered plateau in the centre, surrounded by a vast extent of wild moors.' Beautifully situated among the hills is a fine old house, called Derwent Hall, the property of the Duke of Norfolk. Although only used as a shooting-box, it contains a superb collection of the most wonderful old oak furniture—sideboards, beds, settees, and cabinets, so exquisitely carved and withal so ancient, that they would make the fortune of any collector.

The Peak itself is sterile and desolate in the extreme; even sheep cease to be met with in its barren solitudes. All around is a wild, trackless waste of moss and bog, and stern, naked, lonely hills. 'These mountains are broken up into huge shoulders, with streams running between many of them, deep in heather and ferns, and of a very dark colour, owing to the peaty water that trickles over the surface and stands in deep pools.' Long broad gulches also intersect these barren moors—trenches from ten to twelve feet deep, with soft peaty sides, and a bottom of water or mud, according as the weather is wet or dry. Immense masses of dark rock, sometimes cast by Nature into the most fantastic forms, cling to the steep hillsides, or rise from the level of the moor. From one of these, the Heron Stone, a magnificent view may be had by the returning tourist of the whole range of the Kinderscout, with a picturesque valley and bridge in the foreground, and a little stream, gray and silvery in the waning light, plashing through the furze and fern into the evening shadows. Far as eye can reach, no path is to be seen; all is dark moor and dusky fern, relieved by an occasional patch of vivid green, which experience will have taught him to avoid as treacherous and swampy; and here and there the gleam of water, as a mountain pool or runlet catches and reflects the faint radiance of the evening sky.

After these treeless wastes, one is in the mood for enjoying trees, and ought to accompany Mr Jennings to Sherwood Forest. Although immense areas of the ground have been cleared from time to time, this old Forest still retains deep shady recesses, grassy glades, paradises of woodland scenery, with splendid oaks and beeches interspersed with dark firs and yews. The effect of some of these long avenues of stately trees is simply magnificent. In spring, you have the delicate green of the beech, contrasting beautifully with the reddish-brown of the budding oak; and in autumn, oak and beech alike blaze out into a thousand brilliant shades of gold and russet brown, warming at the extremities of the branches into dusky crimson. To see Sherwood to perfection, the sky should not be perfectly clear, but heaped up with masses of drifting clouds. The shifting lights and glooms of a windy day lend variety to the silvan scenery; the trees wave and rustle in the breeze; and the sunlight chases the shadows across the ferny glades, and down the long leafy aisles of the forest sanctuary. The Birklands—one of the most ancient portions of the old Forest—struck Mr Jennings as surpassingly beautiful. 'The visitor, he says, 'will find his admiration equally divided

between the grand old oaks and the beautiful silver beeches which cover many acres of ground. Finer or lovelier trees are not to be seen in all England; and the contrast between their tapering branches and the rugged trunks and gnarled boughs of the grand old oaks, is full of picturesque effect at every step.

Some of the individual trees are very large. The Shambles Oak, which is considered to be a thousand years old, was of enormous girth; but it is now only a shell, the inside having been burned out. The Greendale Oak, which is eight hundred years old, was formerly so large, that it was said a carriage could be driven through its trunk; but it is now a mere shell, although it still 'makes a fair show of green leaves as summer comes round.'

Around another of these forest giants, called the Major Oak, Mr Jennings one day saw 'eighteen persons, men, women, and children, standing hand in hand, stretching round it at arms' length, and they were but just able to meet each other.' Almost the best point from which to see Sherwood is a comfortable homely little inn *The Royal Oak*. It is in close vicinity to the Dukeries; so called because this district comprises the houses and parks of three noblemen, one of whom, the late Duke of Portland, spent at his seat, Welbeck Abbey, no less a sum than two million pounds on tunnels, underground chambers, and other subterranean works. He had conservatories, ball-rooms, skating-rinks, and riding-schools all underground. 'There is a chapel to which one is taken up and down by lifts: and tunnels without end. One of these is two miles and a quarter in length; it is lit partly by gas, and partly by ground glass from above; and the work inside is as carefully finished as though it had been intended for the front of the Abbey.'

Leaving Birklands, with its shifting lights and shadows and flashes of sunshine flickering through the tender green of the feathery foliage, our author next betook himself to the South Downs, where there is hill-scenery not so savage and desolate, but in its own way quite as attractive as that of Derbyshire. The views are extensive and beautiful. In all directions spread tranquil green fields and woods so notably English, ancient churches and old farmsteads dotting the peaceful prospect; while over the rounded green combs, and the charming hollows and wooded slopes, mingling with the scent of the wild thyme and the cowslip, comes the grateful breath of the sea, which can be seen from almost all points of advantage.

Near Bignor, there are interesting remains of a Roman villa, which was discovered in 1811. This structure is six hundred feet in length, and covers the area now occupied by two fields. Fifty-two rooms have been discovered, some of them very large. 'The visitor will be struck by the traces of comfort and luxury which are still visible in the various apartments—the hot-air pipes, the space for a fountain, the bath-room, and other contrivances, which in these enlightened days would scarcely find a place in the designs of an ordinary architect.' Here, during our long sunless winters, with as much of comfort, and as many of the appliances of civilisation as he could collect around him, shivered the exile from Imperial Rome; solacing himself, for the lack of the sunny

skies of Italy, with many works of art, whose fragments still remain.

Wiston Park is one of the most beautiful spots in the South Downs. It is framed in by a background of picturesque hills; 'and the park is one magnificent lawn, studded with fine sycamores, oaks, and other trees, and commanding exquisite views over Sussex and Surrey.' Deer wander in the sunlit glades; and the deep lanes in 'spring are bright with primroses, anemones, and violets, which fill the air with their delicate scent. On Chanctonbury Hill, at the extreme verge of the park, there is a circular mound, the remains of old earthworks; an ancient British or Roman camp, which has been planted with a double row of trees. Chanctonbury Ring, as it is popularly called, forms a very picturesque feature in the landscape, and is seen from almost all parts of Sussex.

At the village of Kingston is an old church with a low tower, which was given by William de Warrenne, a son-in-law of William the Conqueror, to God and St Pancras. This ancient sanctuary, where prayers and thanksgivings have been offered up for so many centuries, forms an interesting feature in the landscape; and behind it, over the red-tiled and thatched houses of the village, you can see the sea sparkling in the sun, and listen in the drowsy heat of noon to the melodious tinkle of the distant sheep-bells.

In these quaint, old-world Sussex villages, very fine old houses are sometimes to be found, such as that of Plimpton Place, in which Lennard Mascall lived in the time of Henry VIII., this Lennard Mascall being famous as the first who introduced carp into England. His once beautiful mansion has been allowed to go to utter wreck and ruin, and is now hopelessly dishonoured and defaced. The windows are broken; the fine old oak-carving is chipped and knocked to pieces; fragments of tapestry hang rotting on the bare walls; the stagnant moat is covered with a thick oily scum; and everywhere, the defacing impress of abject poverty has been set—a painful and dispiriting picture.

Ashburnham Park is a lovely spot; and the walk to it from Heathfield 'abounds in charming views of hill and dale, woodland and meadow.' The park is ancient and picturesque. It abounds in magnificent trees, and exquisite views of the long line of the South Downs, and the range of hills which extends from Fairlight to Ashdown Forest. In the library of the old house, which was occupied by Bertram de Esburnham at the time of the Norman Conquest, many precious literary treasures are preserved—two manuscripts of the fifth century, a Treatise on the Psalms almost as ancient, a Pentateuch of the fifth century, and a large collection of ancient Bibles. There is also a copy of the Apocalypse, of the sixth century; and numerous first editions of celebrated English books, such as *Paradise Lost*. There are also relics of another kind, which would have been dear to the hearts of our Jacobite forefathers, such as the watch and under-clothes which Charles I. wore on the day of his execution, and which were bequeathed by him to John Ashburnham, who was faithful to him to the last. The latter consist of a very fine cambric shirt, a pair of silk stockings and garters, and silken drawers. The wristbands of

the shirt are delicately embroidered, and it is marked in coloured silk with the letters C. R. and a crown. The watch is of an old-fashioned shape, and has an enamelled face.

With the delightful scenery of Ashburnham, we close Mr Jennings' charming book. The colours on his glowing canvas fade perforce away; a haze gathers over the faint purples of the Derbyshire hills, and the rich greens and browns of wood and meadow and moorland. Even as we gaze, a gray shadow of farewell creeps over the 'grand old South Downs,' with their perfume of wild thyme, and briny fragrance of the sea; and the curtain drops over many a hidden beauty of their untrodden nooks, and forsaken roadways, and quaint, rambling, flower-scented lanes.

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER XXXI.—IN THE AVENUE.

'GOOD-MORNING, Mr Oakley. Glad to see you; and glad to find that, like myself at your time of life, you are an early riser. I called at your lodgings on my road, thinking we might walk down together; but they told me you had breakfasted and gone out, long ago.' Such was Mr Weston's greeting to Bertram when, on arriving at the Yard on the morrow of the day succeeding that of the young man's arrival at Southampton, he found his new Assistant Manager awaiting him there.

'I found I had time on my hands,' said Bertram, smiling; 'and I have spent it in making acquaintance with the Docks hard by.'

'Right, quite right! The more you see of ships, the better,' answered his superior, as he led the way to the counting-house, where already the more diligent of the clerks had hung up their hats and settled themselves on their official stools to commence the labours of the day. 'Now, my young friend,' said the Manager, when he had opened the letters which lay ready on his table, and given some instructions to his subordinates, 'I cannot do better than show you over the Yard, and explain to you what your duties will be, and which department will be under your control. This'—opening the door of a room, the first of a series of rooms, the paint of which was still fresh and glistening, and the wall-paper damp and new—'this is your office—hardly yet out of the workmen's hands; and indeed, you need scarcely enter on your functions until to-morrow. Just come round the place, though, with me, and I can explain as I go.'

So Mr Weston showed Bertram the Yard, the vessels that were in their cradles, almost ready for launching; the unfinished craft in process of construction, and those of which the keels had barely been laid down. He showed him the stores where the materials were kept; the extensions of the premises, but half complete, and where gangs of navvies were toiling with barrow and plank, and pick and shovel, to widen and deepen the excavations where wet-dock and dry-dock and coffer-dam were to be—the slips, the workshops; everything; often pausing to explain to Bertram what was to be his share in the task of inspecting and directing the labours of the stalwart men who were busy with saw and adze and auger, with

hammer and mallet, with rivet and treenail, all around.

The experienced Manager, as the circuit progressed, began to entertain a higher opinion of his junior than he would yesterday have believed to be possible. Worthy Mr Weston, though an excellent man of business, was personally the reverse of brilliant—a plodding, patient man, who had risen in the world by dogged industry and severe integrity; but he was naturally slow to learn, and felt an old sort of unconscious resentment against those who were apter pupils. A dull man is very prone to cherish feelings of this sort. Mr Weston was never willingly unjust. If he had been, he would not have been for three-and-thirty years a valued subordinate, in various capacities, of Mervyn & Co. But he did feel, as some of those old schoolmasters of the pre-dictionary times were wont to feel, as if the road to knowledge ought to be very stony, rugged, and painful, and the pilgrim's progress not too quick.

But there was something in Bertram that overcame prejudice, when the prejudice was honestly held; and Mr Weston presently began to wonder whether his previous opinion, as to Mr Mervyn's mistake in appointing so young a man to a place of trust, might not have to be reconsidered. He had been prepared to expect a shallow, self-confident youth, cleverish, but unsteady, and no more fit to be Assistant Manager than a skittish Park hack is fit to draw an omnibus. But Bertram was so patient, so modest, and yet so strangely intelligent and prompt to grasp the really important details of whatever was explained to him, that Mr Weston was fairly puzzled. It seemed to him as though his new adjutant, in a very little while, would be able to master every point of the complicated system which the Manager had hitherto regarded as a mystery comprehended by himself alone.

Working-hours, for Bertram, were over on that day when the tour of inspection was at an end. On the morrow, he was to be installed in his new office, and to enter on the novel duties of a post that required discretion as well as zeal and energy. He went back, then, to his lodgings and his books; and after his early dinner, rambled out afresh, turning his back to the city and its frowning Bar, and going countrywards. He walked slowly, and the more so that he was deep in thought. How had the aspect of the world's face changed for him since the bleak winter's day on which he had left the Old Sanctuary at Westminster in search of a crust to eat and a roof to shelter him! And how best could he prove that the great good fortune which had befallen him had not been bestowed on one who was ungrateful for the generous confidence of his patron?

Musing thus, Bertram passed on into the broad Avenue, lined by stately trees, and with its wide carriage-road, its separate bridle-track, and its smooth path for the use of foot-passengers, which is one of the boasts of the ancient town; just such a promenade as we find almost everywhere on the continent, save that the stunted lime-trees of Germany or the attenuated poplars of France are here replaced by huge elms, the leafy boughs of which made a pleasant murmuring on that summer's afternoon, as the breeze sighed among the branches. There were carriages rolling along the well-kept road, and riders cantering their horses

on the further side of the parade. But, notwithstanding these attractions, Bertram remained absorbed in his own thoughts, until, suddenly, there came before his vision a glint of golden hair, and the unforgetten, sweet, innocent face of Rose Denham! Rose it was; but how changed, how womanly, and yet herself, fair and tender as the choicest bud of the flower from which she took her name! Yes; it was Rose; and she was not alone, for near her sported two pretty children—a girl of nine and a boy of a year younger, prettily dressed, as the children of the rich now are, and with flaxen curls tossing in the wind. Rose was passing him, when he half-stretched out his hand. 'Don't you know me?' he said, lifting his hat as he spoke.

'Mr Bertram—Mr Oakley,' the girl replied shyly, and startled, like a fawn alarmed by some intruder amidst the fern and bracken. 'I did not expect to meet you here!' And she put out both her little hands to him, in greeting; but as she did so, her lip quivered; and Bertram knew that the sight of him had reminded her of the dear, dead father, Bertram's early friend. She welcomed him, however, in her old, pretty way. 'I am so very glad to see you,' she said. 'I live near here, as my sister may have mentioned, if you have seen her lately—at Shirley, a mile or so away.—And these are my pupils,' she added; 'Alice and Hughie Denshire. I am Mrs Denshire's governess, now.'

#### CHAPTER XXXII.—THE MYSTERY.

The children, considering that the mention of their names constituted a formal introduction, walked gravely up and extended their tiny hands to be shaken. Bertram had one of those faces that children like and trust; and bright Alice and solemn-eyed Hughie, who in his velvet and curls looked like a miniature of some melancholy but chivalrous Cavalier, were soon at ease in the company of their teacher's friend, and resumed their gambols, leaving Rose and Bertram free to walk and talk together in the leafy Avenue.

'You knew I was here; but I did not know you were here. Louisa should have told me,' said Rose, as they paced on side by side.

'Miss Denham could not have done that,' replied Bertram, 'because promotion and a change of residence came to me so quickly, and in so unlooked-for a fashion, that I had not time to call in Lower Minden Street before leaving Blackwall and London. Miss Denham, on the occasion of my last visit, told me that you were in Southampton, or near it.'

'Yes; I live at Shirley Villa—on Shirley Common, as they call it, half-an-hour's walk from this,' Rose explained. 'Mr and Mrs Denshire, to whose children I am governess, are nice, kind people. They have been very considerate and good to me, seeing, I think, that I was young and half-frightened at first at leaving home. I call Lower Minden Street "home," you see, for Louisa is there,' she added, half tearfully.

'I know; for your sister told me how you came to leave her, and why,' returned Bertram gently. 'It was like yourself to do it; and like her to consent to it. But I was sorry when I called, to find that you had gone. I did not think, then, that we should meet so soon.'

Then there was more talk, and he told her of his sudden rise in life. 'Assistant Manager here,' he said playfully. 'It sounds too grand, too good, to be true; and I am afraid my superior officer, Mr Weston, thinks so too, to judge by his looks; but I hope he may think better of it one day.'

'Is Mr Weston your—superior officer?' asked Rose; and reading assent in Bertram's eye, she added: 'Because I know the Westons—my employers know them, I should say, very well; and I often see Mrs Weston and her daughters, and that beautiful Miss Carrington, at the Archery Grounds, and at Shirley. Then do you live with them, now?'

Bertram explained the whereabouts of his lodgings—very near to Mr Weston's house; and explained his relations, officially, with the head of the family. 'He is Colonel, so to speak, and I am Adjutant, of the regiment of workers in Messrs Mervyn's local Yard,' said Bertram; 'and if I do but learn my duties as well as he has done, all will be well. He thinks I am too young. He has not said so; but I read it in his face. Never mind. I can but do my best to justify my early promotion.'

'That I am sure you will,' said Rose warmly; and then she blushed and looked down.

Then, for a while, the conversation languished. A keen observer, had such been there, might have noticed that each of these two young people looked at the other shyly, coyly as it were, as if each had grown to be half a stranger in the interval that had elapsed between the times of their former intimacy and their present meeting. Rose was so womanly, and so much more earnest and thoughtful than of old, and yet her own sweet self, the Rose Denham of Blackston, the bright young girl whom Bertram remembered so well. Bertram was changed too. Tall, manly, and with a bearing more assured, yet as graceful as in his stripling days, Rose felt half afraid of him; yet she trusted him instinctively.

'Ah, if I had but such a brother!' was often in her thoughts as they walked along.

'I wish you were my brother,' she presently exclaimed abruptly, and then flushed crimson.

'Why, Miss Rose?' returned Bertram, fairly taken aback.

'Because, Mr Oakley, I could ask you then for—for counsel—and help—in a matter on which I have no one else to advise me, and cannot ask for advice.—I have so few friends, and not a soul but yourself and Louisa to whom I could appeal.—Do I vex you, by saying this?' she asked piteously, as he kept silent.

'On my life, on my soul, no!' was Bertram's eager answer. 'Only show me how I can serve you, dear Miss Rose, in any way; and for the sake of your generous father, for your own sake, I would, and will, spare no pains to be useful.'

Still Rose hesitated to speak. She glanced up at Bertram, so calm and strong, with his dark eyes, so full of thoughtful light, fixed upon her, and with an effort she at length said: 'I have been so frightened—I am very silly, perhaps; but I am young, and know so little of the world—and he frightened me.'

'Who has dared to do that?' demanded Bertram, with a sternness that was new to his voice. He had, as many brave men have, a temper that was patient and genial; but the idea of wrong or

harshness to the tender and the innocent, brought a glittering light into his eye that few ill-doers would have cared to confront.

'He—the person I spoke of,' explained Rose, in feminine fashion—'he persecutes me. I never know when he will come. I should not like to be walking here, but that Alice and Hughie are some protection, and the place so public. But he frightens me.'

'Some impertinent coxcomb—some silly fellow, who presumes to annoy you in your walks,' exclaimed Bertram. 'If only you could point him out to me, I would take care that you should be no longer molested.'

'No,' replied Rose, half sobbing—'no; it is not quite that. The man is not rude or impertinent, but he scares me. He tells me, Mr Oakley, that for Louisa's sake, I must listen to him.'

'For Louisa's sake? for the sake of your sister?' exclaimed Bertram, astonished. 'Why, how, in the name of all that is amazing, did he know of her existence, and what does he want?'

'He wants—to marry me,' said Rose, speaking in a very low voice, lest the children should overhear; 'and he says that I must, for Louisa's sake and mine—that he can make, or mar both our fortunes—that it rests with him to make us end our days in affluence, or struggle on in poverty, and, and'—

'The fellow must be mad!' cried Bertram, knitting his brows—'mad, or else an impudent impostor. Do you know him—his name, I mean, or where he lives, or what his rank in life or calling may be?'

'I do not think he is mad,' answered Rose decisively. 'He talks strangely; but what he says is always coherent. As for his name, or where he lives, I know nothing. He comes and goes like a ghost. I may see him once or twice a day, and not again for a week. Whether he even lives in Southampton, I do not know. I have sometimes fancied that he did not. And I have not liked to write to Louisa about it, for fear she should be frightened for me; nor do I dare to tell Mrs Denshire. She would laugh at me, or perhaps talk of the police. And I thought, Mr Bertram'—

'You thought, Miss Rose, that I might help in protecting you from annoyance, as heaven knows I willingly would,' said Bertram, completing the unfinished sentence. 'But this is a perplexing state of things. If the man is not rude'—

'No; he is not exactly rude, but peremptory. He says it is my duty, and my fate, to be his wife,' replied the girl. 'He talks of wealth for me, wealth for Louisa, and always as if the fortune of which he speaks were in his free gift, to bestow or to refuse, at his pleasure. And as he saw, perhaps, that riches do not tempt me much, he dwells upon my duty to my sister, and on the happy home I might share with her.'

'How did he first find you?' asked Bertram, growing more and more thoughtful.

'He came upon me in a shop, where I had gone to execute some commission for Mrs Denshire,' replied Rose. 'But I think—I am sure—he had been following me for some time before that. Then he entered, and took off his hat, and called me by my name. He asked for a minute's conversation. I could not get away, and he spoke. He has waylaid me since then, in the streets, on

the Common, everywhere, and always on the same pretext.'

'What sort of man is he? Young or old? A gentleman, at least, he cannot be,' said Bertram.

'He is not young—nor is he old; and I cannot guess what he may be. He is very well, but too showily, dressed, with a superfluous display of trinkets. He is not so tall as you are, but active, and very dark and sunburnt, and has a habit of twisting his long black moustache, that droops over his mouth, when he gets earnest.'

'Ah!' exclaimed Bertram, with an involuntary start of surprise. In whom, once, had he noted such a trick of manner? He could not at the moment remember. He did his best, however, to comfort Rose and to charm away her fears, bidding her look upon him as if he had been indeed her brother, and promising to do his best to protect her from annoyance. And then, as it came to be time for them to part, he told her that, with her permission and Mrs Denshire's consent, if Rose would ask it, he would call at Shirley Villa on the earliest day on which he could do so without neglect of duty.

'Mrs Denshire will be willing to see you, I am sure,' answered Rose, 'when I tell her of old days, and that you are Mr Weston's friend. And you will find me, generally, when the children and I come back from our walk, as now. I shall write Louisa word of your good fortune, and she will be glad, as I am.—And now, good-bye!'

So they went their several ways; Rose with her charges returning to Shirley; while Bertram, with a thoughtful brow, went back to the town. He felt nearly sure, now, that he remembered when and where he had noticed that trick of twisting the moustache to which Rose had alluded. But then the offer, the confident offer, of a fortune in exchange for Rose Denham's hand. The thing was impossible! Yet his mind dwelt upon it.

(To be continued.)

### IRISH MATCHMAKING.

NEARLY every one has heard of Shrove or Match-making time, though few really know to what extent it is carried on in the south of Ireland. A few particulars and some instances of the 'matches'—for such is the name that proposed marriages go by—may not be uninteresting to those unacquainted with the custom.

'Shrove-time' begins after Christmas, and ends on Shrove-Tuesday, or the day before Ash-Wednesday; as, during the ensuing seven weeks of Lent, no marriages are celebrated in the Roman Catholic Church. About three weeks before Lent is the busy time for the 'matchmakers.' These are men who make it their business to find out the fortunes of, and get suitable partners for, all the eligible young people of both sexes for many miles around. Sometimes they are remunerated for the transaction, but far oftener they carry it out for mere pastime. Thus, when the well-to-do parents of a marriageable son find themselves getting on in years, and unable to look after their farm and all connected with it, they tell their boy that he must take a wife, and straightway send for their friend 'the matchmaker.' The old people, in such cases, are quite content to give up the farm to the son, seldom asking anything beyond their support,

and a seat in the 'chimney corner' in the 'old home' for the rest of their days.

The son who thus obtains possession of a house and farm is considered well off; therefore the girl he marries must have money equal, or nearly so, to his, or cattle wherewith to stock the land. When everything has been arranged between the parents on both sides, the day for the marriage is fixed, and the marriage-money made up for the priest, who generally gets from eight to twelve, though sometimes as much as fifteen or twenty pounds. The young people may meet once, or oftener, before they are married, but sometimes they see each other for the first time only at the altar.

Near the village of G—, lives a man named Mike S—. He is one of the principal match-makers in the neighbourhood. I know him personally, and have often heard him speak of some of the 'matches' he had made, or was about making. The last few years not having been so good as usual for farmers, the weddings were not so many, and the fortunes in most cases were small. One of the best for this season—and over which Mike was very busy—was the marriage of a farmer's daughter whose fortune was one thousand pounds. The young man 'spoken of' for her had a fine house, thirty milking-cows, twenty yearlings, and 'as fine a pair of horses as ever were put to a plough.' 'But that's not all,' said Mike; 'he has besides a brand-new thrashing-machine!'

Mike was very indignant over another match he had made, and was obliged, through 'the maneness of the ould people,' to break it off again. 'They actually,' he said, 'wanted to make the young people feed some hens for them; and sure, when I saw them so stingy, I says to the girl: "Hold yourself higher than to enter that family!"' And she took his advice.

On another occasion when the aspiring bride and bridegroom met for the first time at the altar, the latter, surveying his intended, was shocked to find that she possessed only one eye. 'Faix,' said he, 'I will marry no girl unless *all* her eyes are there.'

When in the shop of the principal milliner in our village this Shrove, I asked if she had many bridal bonnets to make. 'No, indeed,' she answered. 'There's a girl of the Scanlans getting married to-day; but I made her bonnet two years ago.' 'How was that?' I asked. 'Well,' she replied, 'they were on the way to the chapel, when they had a difference, and the match was broken off; but, like a sensible girl, she kept the bonnet, and now it comes in handy enough.' Perhaps one of the most curious of these extraordinary matches is the following. There was a marriage arranged, and the friends were invited to the wedding. The party, amounting to the occupants of some half-dozen cars and a few horsemen, started for the chapel. Just as they stopped outside of it, the father of another girl came to the bridegroom and offered him his daughter with ten pounds more fortune than he was getting with the one he was 'promised to.' 'Done!' said the ungallant bridegroom; and straightway broke off the former match, and married the girl with the most money.

Few weddings in the neighbourhood are quite complete without Mike. He is a very extraordinary fellow, and gets into so many

quarrels, that, as his wife expressed it to me, 'he would have been hanged over and over again but for the master.' He lives on a wild moor surrounded by bogs. A near neighbour of his having got married through his influence, Mike, in duty bound, went to the feast. As the night wore on, the excitement of dancing, combined with a plentiful supply of liquor, began to have a bad effect on our friend, until at last he could contain himself no longer; and snatching a kettle of boiling water from off the fire, he turned bride and bridegroom and all the guests out of the house, and hunted them over the bog.

The eatables provided on such occasions are plentiful and wholesome. Cold meat of any kind, however, is considered an insult to offer. Everything must be *hot*. The fowls are generally captured, killed, made ready, and cooked, during the absence of the wedding-party at the chapel. Bacon is a favourite dish; and a leg of mutton is held in greater repute than roast-beef. Sometimes a 'barn-brack,' or large currant-loaf remarkable for its size and abundance of fruit, is ordered from the baker, and forms, as 'wedding-cake,' a conspicuous addition to the table. This 'Shrove-tide,' I saw a wedding-feast spread. At each end of the table was a huge piece of bacon. 'Down the centre of the table, beef, mutton, and the produce of the poultry-yard were largely represented. Several decanters full of wine, and bottles of whisky, were placed at intervals on the table. On a smaller table, tea, eggs, &c. and the 'cake' were laid out. This was a small and quiet wedding, the ceremony taking place as early as nine o'clock in the morning.

I must not omit to note, however, that punctuality on the part of the bridegroom—and sometimes even on that of the bride—is by no means invariably observed. I will give one instance, which happened this 'Shrove-tide.' The wedding was fixed for ten o'clock A.M. The bride came, but no bridegroom greeted her. She waited all day, till quite late in the evening, and still he came not. Late that night, a message arrived from him to say he would be at the chapel after first mass next morning. Next morning, faithfully came the expectant bride again; but again she had to wait all day for the dilatory bridegroom. At length, about seven o'clock in the evening of the second day, the tardy lover appeared; and though many brides would, after such a trial, have lost patience for ever, not so with the faithful Irish lass. The priest did his duty; and the two went away as happy as their own loves and the plaudits of their cheery neighbours could make them.

## THE FAMILY DIAMONDS.

### CHAPTER III.—AND LAST.

THE second day after our misfortune, I received a telegram from Robert, which ran thus—'Come at once by the express. Thief caught. Bring Martha with you. Your evidence required. Will meet you at station.'

How admirably he had filled in the twenty words! The news soon leaked out and spread over the village; and as we drove through it in Mr Thomson's trap, which he kindly lent to us for the occasion, every one turned out to

look at us; for, owing to gossip and the sensational accounts of the event that had appeared in the newspapers, we and our affairs were as public as if we were, as Martha said, 'the crowned heads of Europe.' The station-master was most obsequious, and himself held open the railway carriage door for us, and made the porters bring us foot-warmers.

'If I win them,' began Martha, breaking up a reverie into which I had fallen as the train started, 'I will sell them, and get a good mortgage for the money at five per cent. Then I will buy a little pony and trap like Mr Thomson's—perhaps he'll sell me his cheap.'

'Talk of what you'll do with them when you've got them,' I burst in angrily. I declare it is perfectly disgraceful the way she makes eyes at that man. And at her age too! She ought to know better. Ah! well, I could tell things if I opened my mouth. I know who sent me those beautiful piccotees in the summer, and it isn't Martha that he stops to speak to on Sundays after church.

Robert met us at the terminus. He looked very mysterious, and spoke very oracularly when we questioned him about Ayel's capture.

'O dear! what a crowd there is!' exclaimed Martha as we drove through the Strand. 'I suppose, though, they are all going to the Police Court to hear our case.' It was Martha's first visit to the busy Metropolis, therefore her astonishment at the thronged thoroughfares was excusable.

At length our ride came to an end. The cab stopped, and Robert assisted us to alight.

'O look!' again cried Martha excitedly, grasping his arm and pointing towards a dirty little boy standing in the gutter with a newspaper placard held in front of him. We looked, and there, in inch and a half type, was printed, 'THE GREAT INDIAN JEWEL ROBBERY—Capture of the supposed Thief.' It gave one quite a little glow to read it. It made one feel so important. Two policemen were guarding the entrance to the court; but as soon as Robert told them we were witnesses in the great case, they became wonderfully polite; and one of them escorted us into a dingy, dusty-looking place, where Ayel was to be arraigned for her crime. We were conducted to a seat very much like an old-fashioned church pew, and told to wait until our case was called, which would not be long, as it was first on the list.

'O dear!' sighed Martha, as she glanced apprehensively at the unwashed and unwholesome-looking crowd that thronged around us. 'I am so afraid of small-pox.' She had brought a monstrous double vinaigrette with her, at which she kept constantly sniffing. 'You had better take a sniff, Patience,' she whispered, thrusting it under my nose. 'It will keep off infection.'

It was really too bad of her; for if there is anything that I thoroughly detest, it is aromatic vinegar. It always makes me sick. I pushed it away from me; and then some one cried 'Silence!' and a little, gray-haired, old gentleman came in through a doorway at the back of the court and took his seat in a large leather-covered chair.

'Where are his horse-hair wig and ermine robes?' whispered Martha.

'Hush!' I replied; 'don't speak so loud. Those are worn only by the judges.'

'Isn't he a judge?'

'No; he's a magistrate.'

'Oh!'

I do not think that she understood my explanation; but there was no time for anything more, as that treacherous black creature had just been placed in the dock by a policeman. She looked very wild and frightened, and glared around her just like a wild beast. Then Robert was made to stand up in the witness-box and take the oath, which I think he did most beautifully, kissing the book so reverently; and it must have cost him an effort to do so, for the cover was not particularly clean. The magistrate listened attentively to every word he said, and wrote it all down in a book. 'Have the jewels been found?' he asked.

'Yes, please Your Washup,' answered a policeman from the body of the court.

Robert was asked to stand aside for a few moments, while the man took his place; and I must say it was most improper the flippant way in which he took the oath. It was such a contrast to Robert's reverent dignity. In a few curt phrases, he told the magistrate that he had found the prisoner in a low eating-house at Lambeth, and that, when searched at the station, the jewels had been discovered in her possession. As he spoke, he produced the red bandana that she had been wont to wear tied over her hair, and unfolding it, displayed the lost jewels—the Maharajah's celebrated present—Aunt Purpose's diamonds! I leant forward eagerly to see them. Even Martha opened her eyes, which, since the commencement of the case, had been affectingly closed, and for the moment forgot to sniff at her vinaigrette. Yes; they were indeed beautiful, and well worthy of all our anxiety and trouble about them. A ray of sunshine had struggled through the dingy skylight, and falling upon them, made them sparkle and glitter with a thousand varied flashes of light. The set consisted of a necklace, a very large brooch, a pair of ear-rings, and a pair of bangles, which I thought were bracelets, but which turned out to be anklets. They were handed up to the magistrate, who inspected them very carefully. Then the policeman was told to stand down; and Robert resumed his former place.

'Are those the jewels?' asked the magistrate, as a clerk placed them before him.

'I believe they are,' he answered, as he gazed at them curiously.

'I must have something stronger than belief,' said the magistrate; and then a most astounding thing came to light. With the exception of the prisoner, there was no one, to our knowledge, in England who had ever seen the jewels before they had been stolen! Who was to identify them?

It was in vain that Robert produced the empty case and showed the marks where they had lain. That by itself was no evidence, the magistrate said; and before committing the prisoner, he must have some stronger legal proof put before him showing that the jewels that had been lost and those found on her were the same.

'I think I had better adjourn the case, to enable you to obtain this evidence,' he suggested to Robert, who was completely nonplussed at the turn affairs had taken. Was he to send out to India and subpoena the Maharajah himself? It seemed such a monstrous thing that, with no moral doubt on the subject, the law should pre-

vent our recovering articles of so much value as those in question.

'What is their value?' asked the magistrate, who had been giving them a second examination.

'Several lacs of rupees,' murmured that idiotic Martha, quoting my words as she snuffed at the smelling-salts' end of her vinaigrette until its strength made her gasp, and sent the tears coursing down her cheeks.

'Between three and four thousand pounds, I believe,' said Robert. The magistrate still went on looking at them, amidst a dead silence in the court, save for the noise made by those fussy reporters as they resharpened their pencils.

'Have you any one here who can give a positive opinion as to their value?' at length he asked, as he turned to Robert; but he could only shake his head.

Then, a lawyer who was in court rose, and told the magistrate that his client, who was waiting for the next case, was an eminent jeweller, and would be very happy to give the Bench his assistance. A tall, middle-aged, and gentlemanly looking man arose, and accepting the magistrate's invitation, stepped up beside him, and took the jewels in his hand. He turned and twisted them about, placed the tip of his tongue to them, held them up to the light, and then, fixing a small magnifying glass in one eye, he stared at them through it for the space of a few seconds. 'They are excellent—unequalled, I should say,' he said as, having finished his examination, he returned them to the magistrate. 'The finest that I have ever seen.'

Oh! how our cheeks flushed at this invaluable testimony to their worth, and how fast those clever reporters' pencils flew over their paper!

'And pray, what may be their value?' asked the magistrate. You might have heard a pin drop as every one listened for the answer.

'Their present value'—he spoke with provoking slowness—'may be—about—five pounds.'

It was as if a bomb-shell had fallen amongst us.

The magistrate smiled. 'They are then,' he said, 'as I thought'—

'Paste—made doubtless by one of the best French houses.'

The announcement was greeted with an uncontrollable burst of laughter; and I could have stabbed those conceited reporters. It did make me mad to see the gusto with which they wrote down what I knew they were describing as 'Sensation in court.'

To add to the confusion, Martha screamed herself into hysterics, during which she contrived to empty that nasty aromatic vinegar all down the skirt of my black silk; fortunately, it was not my best one.

I hardly know how we got out of the place and away from the vulgar crowd that pressed against us on every side. At last, I managed to drag her into a cab; and we drove back to the railway station, where, after a time, Robert joined us. Ayel, it appeared, after we had left, had confessed her theft, and been sentenced to a short term of imprisonment, the hapless jewels being returned to Robert.

Silent and glum, we returned to Nettlethorpe, hoping, by a discreet silence, to keep our shame and annoyance from our neighbours.

On searching through Aunt Purpose's papers, we discovered that she had been perfectly aware of the composition of the Maharajah's present; but owing to the prestige that the supposed possession of such valuable jewels gave her, had kept the secret—even to the deception of the confidential Ayel. It was too bad of her, though, to deceive so cruelly her husband's kith and kin, more especially as, to our chagrin, we found that all her and Uncle Job's savings had been sunk in an annuity, which of course died with her. After sending Ayel back to India, at the expiration of her term of imprisonment, which was more than she deserved after her ingratitude—the 'rest, residue, and remainder' of Aunt's property to be divided among us came to a trifle under a five-pound note. As for the jewels—drat them!—we would not draw lots for them. Robert sold them for two pounds ten, which he pocketed, to pay his expenses, he said, in his chase after Ayel. He never even offered either Martha or me the price of our railway fare to London—and it was first-class too, for we had to travel by the express—as he declared that it was insufficient to repay him all that he had expended.

Our resolution to keep silent about the events of our visit to London was rendered useless by those wretched papers. They not only published a full and unnecessarily detailed account of the case, but some of them actually made merry over our sufferings in leading articles! We thought, however, that the neighbours would have had the delicacy and good taste to respect our wishes on the subject; but alas!—for ill-manners commend me to a Nettlethorpean—instigated, as I verily believe, by that man Thomson—he thinks himself a wit!—they positively dared to give us a nickname, and since then, wherever we go, we are always known as 'The Family Diamonds!'

## RABBITS IN NEW ZEALAND.

BY A RUN-HOLDER.

A FEW years ago, one or two articles appeared in *Chambers's Journal*, giving an account of the mischief then being worked by rabbits in the southern part of New Zealand. Since then, the plague has greatly extended, in spite of legislation and all efforts on the part of holders of land. Now, however, there is a prospect of a better state of things; and it may be interesting to learn how, from small beginnings, utter ruin nearly came over a large tract of country, and the steps which are now being taken to avert it.

About a score of years ago, an immigrant to Invercargill, a town in the south of New Zealand, brought with him from England seven rabbits. He offered them for sale to the authorities of the former province of Southland; and they, thinking it would be a good thing to have some furred game on the sandhills which abound on the coast, gave him a small sum of money to turn them out there. I believe that rabbits were also turned out further north in Otago; but those seven were the progenitors of the mighty swarm which has infested the country.

For some years the rabbits seemed to stay about the sandhills, where there was very good shooting, and little was thought of them. When they got very thick, they fed so close to the ground that

the covering sward which held the sandhills together was destroyed, and the sand began to be blown inland, spoiling a good deal of ground. The rabbits themselves also became a nuisance to farmers near the coast; but these holdings are small, and by trapping and shooting, the farms can be kept moderately clear. The country back from the coast is a plain for twenty or thirty miles. Then come rolling grassy hills, where begin the sheep-runs. Farther back are mountains of about five thousand feet, fit for sheep; and farther still is the great backbone of New Zealand, so high and rough as not to be fit for any stock but rabbits. Among the hills and smaller mountains are many plains of considerable extent. The rivers Oreti and Aparima have exceedingly wide and shingly beds, and flow through flats for almost all their courses. The sandhills where the rabbits were turned out are between the mouths of those two rivers.

In 1876 the evil had grown to such an extent that the colonial government appointed a Commission to inquire and report as to the state of the rabbit nuisance, and to suggest remedies. The Commissioners travelled through the country, and made many inquiries. Their Report said what every one knew already—that matters were very bad, and likely to be much worse. An Act was then passed by the legislature which gave a bonus of a halfpenny for every rabbit-skin exported; and empowered the inhabitants of any district badly overrun with rabbits to elect a Board, whose duty it was to see that all holders of land destroyed their rabbits. In case any holder failed to do so, the Board was to have it done at his expense.

It is hard for any one not acquainted with the subject to understand the desolation wrought by apparently so small a plague. It must be remembered that the population in the greater part of the interior of Otago is very sparse—houses being seldom less than ten miles apart—that a run of fifty thousand acres is often worked by half-a-dozen men, and that rabbits breed once a month for eight months of the year, having from four to eight young ones at a time. The surest test of the evil is the decrease of sheep, and there are several runs where the decrease is three-fourths of the former stock. One run I know where the stock has diminished from twenty to five thousand. A sheep-run is generally a tract of country belonging to the Crown, whereon the run-holder, for a yearly rent or assessment, has the sole right of rearing stock. Within the last year or so, the rabbit-plague has grown to such an extent that many runs have been utterly abandoned as worthless by the holders, who of course have ceased to pay their rents to the Crown. All sheep-farmers have been much impoverished, and many ruined. The licenses to occupy runs are generally for a period of ten years; and as these licenses have only, in many cases, a short time to run, it does not pay the tenants to go to much expense in killing rabbits.

The run-holders, as a rule, have done their best to keep down the rabbits, and have tried many different plans. The principal one has been to employ men with large packs of dogs to kill at so much a skin—the skins being properly stretched and dried. These men have generally from twelve to twenty dogs apiece, and of course cause

incessant disturbance to sheep. The dogs, too, often get away from their masters, and worry the stock. Sometimes men are employed to shoot, ferret, and trap. The cost of killing has generally been about twopence a head, and the produce of sale of skins a good deal less.

Various other plans have been tried for abating the nuisance, and ingenious inventors have devised many traps of the most absurd and fantastic description. It was proposed to introduce weasels and other vermin, and one gentleman brought some mongooses from India. The worst of this plan was that while the vermin were getting numerous enough to keep down the rabbits, we were all very certain to be ruined.

Various chemical means have been proposed for smothering the rabbits in their holes. The best plan was suggested by Dr Black, Professor of Chemistry in Dunedin College, to use bisulphide of carbon. This chemical is exceedingly volatile; and if some cotton-waste, or sheepskin saturated with it, is placed in a hole, and the outlets are carefully stopped, the rabbits inside will be certainly killed. A good many people used this plan to a considerable extent; but it was too expensive to attempt by its means to exterminate rabbits, or even keep them in check over large blocks of leasehold hilly country.

The last plan, and that which we all hope is to be the salvation of the country, has been in use for upwards of a year. It is to sprinkle grain poisoned with phosphorus wherever there are rabbits. At first, crushed wheat was used, and a certain quantity of oil of rhodium and sugar was added, to make the bait more attractive. On experience, however, it has been found that oats—about one-third of the price of wheat—are better, and that the oil of rhodium and sugar are not necessary. The process of mixing is now simple and safe. At first, people used to stir the mixture over an open boiler, and so ran great risk from the fumes of phosphorus. A better way is to put the oats into a barrel with a close-fitting lid, saturate them with boiling water, pour in the phosphorus—which has been fused in a small pan of hot water—and then roll the barrel backwards and forwards for a quarter of an hour. The poisoned grain will be fit to lay out when cold. It is usual to sell the poison to men who lay it out on the runs. They collect the skins of the rabbits, and are paid, generally, twopence apiece for them properly stretched and dried.

The cure is certainly wonderful. Wherever the poison has been properly laid, the rabbits have well nigh disappeared, and the nuisance has become a perfectly manageable one. The skins at present prices bring more than it costs to obtain and prepare them, so that any one can afford to clear his run, however short his lease may be. All this good is worked without disturbance to the sheep, and the packs of hideous mongrels which have for years infested the country may at last be done away with.

The objections to the cure are of course obvious. All imported and native game will suffer severely where poison is laid. The rabbits *must*, however, be put down, or else the greater part of the South Island will be made useless. Better import game at some future time, than be driven out of the country. The native birds will not be exterminated. There is too much wild country which is

not occupied, and is not likely to be occupied for many years. There they will be left in peace; and when the rabbits are no longer a curse, the birds will return to the occupied country. As far as I can judge by experience, even where poison is thickly laid, birds do not take it very freely. I hear English larks singing over it every day, and I have never seen a poisoned native titlark, a bird which abounds everywhere. None of the wood-birds are likely to suffer much. Paradise ducks, wekas, and pukekas will feel it most. The pukeka is a kind of laud-rail, very numerous and destructive to grain, both when growing and in the stack. The weka is a curious rail which cannot fly, and has already suffered much from rabbits' dogs. I am sorry for the weka and the Paradise duck—the latter a beautiful bird. But the destruction will not be so great as some people fear. Ever since the poison has been laid, I have seen or heard of very few poisoned birds. We must accordingly hope for the best. People are certain to continue laying the poisoned grain till some one invents a better remedy.

### ODD OFFENCES.

LOVERS of liberty as they were, our forefathers had little patience with propounders of novel notions. When Henry Crabb, suddenly awaking to the fact that success in business was not to be attained without much lying and deceit, forswore his calling of haberdasher of hats, and betook himself to playing the hermit, and practising vegetarianism—he was put in the stocks, ousted from one refuge after another, and finally lodged in prison, to prevent others imitating his evil example.—‘Sir George Carteret,’ says Pepys, ‘showed me a gentleman coming by in his coach who hath been sent for up out of Lincolnshire. I think he says he is a justice of the peace there—that the Council have laid by the heels here, and here lies in a messenger's hands, for saying that a man and his wife are but one person, and so ought to pay but twelvence for both to the Poll Bill, by which others were led to do the like; and so here he lies prisoner.’—The justice, however, received gentler treatment than was accorded twenty years earlier to a woman of Henley-on-Thames; who, venturing to speak her mind respecting the taxation imposed by parliament, was bound fast, and cruelly, to a tree one market-day, and a placard tied on her back, setting forth the enormity of which she had been guilty.

In all times and in every land, an over-free tongue has proved troublesome to its possessor. In Plantagenet times one man was sent to prison for twelve months for offering to call the chief magistrate of London a scoundrel, and fight him too, if any one would pay him for his pains. Another was pilloried for saying the Mayor had been sent to the Tower. And Roger Jorold, for foolishly boasting that if he caught that dignitary outside the City bounds, he would insure his never getting within them again, had to present the insulted Mayor with a hundred tuns of wine. King James I. ordered two Londoners to be whipped from Aldgate to Temple Bar for speaking disparagingly of Spain's popular representative, Gondemar; and Recorder Fleetward let every one know that liberty of

speech was an offence against the Commonwealth, by sending a saucy fellow to jail for venting his enjoyment of a hearty bread-and-cheese meal, by swearing he had supped as well as my Lord Mayor.

In 1877 the magistrates of Tadcaster gave one Leatham two months' imprisonment for audibly anathematising the Queen twice, while the prayers for the Queen and the Royal Family were being repeated at a school-room service; despite his plea of extenuation that he uttered the obnoxious exclamations unconsciously, having been talking about the Queen's taxes a little while before. A like sentence was passed upon a soldier for publicly consigning the Pope and Mr Gladstone to the place paved with good intentions; but this was in Belfast, where the authorities are particularly severe upon lingual improprieties. Hearing, or fancying he heard the owner of a lagging dog exclaim, ‘Come along, you old papist!’ a zealous officer summoned him for using party expressions in the streets. The offender averred that he said, ‘Come along, old Pepper’—that being the animal's name; whereupon the magistrate kindly said he would give him the benefit of the doubt, which he did, by fining him five shillings.

Soon after the Germans took possession of the provinces ceded by France, they sent an Alsatian girl to prison for criticising the photograph of the Grand-duke of Baden in disrespectful terms; and fined a Lorraine woman five thalers for marking her disapproval of a soldier's primitive habits with the exclamation: ‘What! with all our five milliards, they have not got pocket-handkerchiefs yet!’ Of course, French journalists did not omit to enlarge upon the tyranny of the Germans; but they were discreetly silent when a Parisian with a grievance was punished for telling a friend that somebody was as ‘cowardly as MacMahon.’ A few months later, he might have abused the Marshal to his heart's content with impunity.

It does not do to be in advance of one's day. In 1618 a Weymouth butcher was amerced in three shillings and fourpence for killing a bull unbaited, and putting the flesh thereof unto sale. About the same time, certain good citizens of Worcester presented a formal complaint against John Kempster and Thomas Byrd for not selling their ale according to the law, charging only a penny a pint for beverage of such extraordinary strength as to lead to assaults, affrays, bloodsheddings, and other misdemeanours; in other words, for giving their customers too good an article—an offence not by any means likely to occur in our modern world.

Brutality to women rarely entails adequate punishment, but we cannot but wonder at a cruel husband receiving a twelvemonth's imprisonment for what the reporter termed an inhuman assault upon his wife; since, so far as appeared, his inhumanity was limited to playing the Dead March in Saul over his helpmate. He had evidently some music in his soul; like the work-house official who lost his situation for setting three blind fiddlers to play as many tunes, while he sang a song having no connection with one or the other.—A humorous rogue, too, was the needy tailor who sheared the tails off the coats of the playgoers waiting at the doors of a Liverpool theatre, and was captured with his spoil upon him.—Another original offender solaced his disappointed love by going to witness the consummation of his rival's triumph, and strewing the church floor

with fulminating powder, which exploded at every movement of the bridal party.

The law presumes that everybody knows what he may and may not do, and acting on that presumption, unpleasantly enlightens those who are not so wise as they should be. The eldest of three men charged with stealing primroses from a wood, said: 'The primroses grow of themselves; who ever heard of stealing primroses?' The prosecuting farmer owned that the primroses grew wild, but he 'made property of them,' and they were not to be reached without crossing his fenced-in land. The magistrate, discharging the offenders with a warning, informed them that though there was no law forbidding the gathering of wild-flowers in the lanes and hedgerows, it was unlawful to trespass upon private land and take anything away.—An Illinois citizen brought his daughter's young man before a justice for violently ejecting him from his own parlour one Sunday evening. After hearing the other side, the justice said: 'It appears that this young fellow was courting the plaintiff's gal, in plaintiff's parlour; that plaintiff intruded, and was put out by defendant. Courting is a public necessity, and must not be interrupted. Therefore the law of Illinois will hold that a parent has no legal right in a room where courting is afoot. Defendant is discharged, and plaintiff must pay costs.'

Different notions as to the necessity of courting prevail in Texas, or a susceptible individual would hardly have been fined for telling a pretty girl he should very much like to kiss her: leaving him as much puzzled as to where the justice came in, as the man in Indiana, who, returning home from a journey, found the house empty, his wife having railed all the furniture, and absconded with the proceeds; and before he thoroughly comprehended the situation, found himself arrested by the sheriff for permitting gambling on his premises!

If it be unwise to prophesy unless you know, it is something worse than unwise to advance accusations impossible to sustain. Yet if newspaper reports are to be believed, a bill-sticker was prosecuted for the incomprehensible offence of burning somebody's 'photograph in effigy'; Elizabeth Simmons was charged with being the father of Henry Wood's child; and a drunken laundress arraigned for assaulting a policeman by 'springing up and striking him in the chest with the soles of both her feet at the same time, dropping on them again like an acrobat'; a feat the constable swore the prisoner performed, in spite of her pertinently demanding where her body was at the time, 'as she wasn't a spring-board.'

A sapient coroner read a witness a severe lecture upon the enormity of being out of bed at one o'clock in the morning, refusing him his expenses by way of marking his disapproval of such an impropriety. Of the same way of thinking was constable Snooks who took a man into custody for presuming to come outside his own door at that early hour, after the zealous officer had put him inside the house. Another active and intelligent officer, catching a young man, late at night, in the heinous act of putting his latch-key into its proper keyhole, hauled him, spite of resistance, to the station-house; and next morning had the satisfaction of hearing the magistrate indorse the action, and sentence the delinquent to a spell of hard labour for 'resisting an officer in the execution of

his duty.' Some magistrates seem to hold that the police are masters rather than servants of the public, and that the latter are bound to submit quietly to any indignity at their hands. A Bermondsey shopkeeper having been hustled by a number of constables proceeding to their beat, demanded the sergeant's number, upon which he was pushed through a shop window, and promptly arrested for being drunk and disorderly, and breaking the ranks of the constabulary. The magistrate who heard the case was compelled to pronounce the charges false and frivolous, but told the accused he had only himself to blame; taking the sergeant's number was a very foolish thing to do, for 'to take their number gave many constables great offence.'

Right and wrong is often a mere question of locality. Long after coffee was an established beverage in every European land, a schoolmaster of Hesse was sent to prison for drinking it in defiance of the decree of his High Mightiness the Landgrave, who, like other well-intentioned law-makers, could not endure that any one should enjoy a thing displeasing to his own palate. In 1875, three French ships in the harbour of St Pierre, Martinique, failed to lower their yards on Good Friday. Next day, each captain was fined a hundred francs for outraging the religious sentiments of the people. But when a Paris linen-draper advertised that his shop would be closed the following Sunday 'for repairs,' and the *Univers* denounced the notification as an outrage upon the religious sentiments of Christian women, which they ought to resent by shunning the shop for evermore, the linen-draper went to law, and obtained four thousand francs damages for the libel.

When at Rome, do as Rome does, is easily said, but not so easily accomplished. A Western man spending a day in Boston, bought a cigar, and started for a stroll. He had not gone many yards before he was tapped on the shoulder by a police-officer, who politely informed him that he had incurred a penalty of two dollars by smoking in the street. The innocent offender handed over two dollars, and walked on. Presently, he came across a hungry-looking urchin, to whom he good-naturedly proffered a piece of gingerbread, and immediately a policeman was at his elbow intimating he had thereby violated a city ordinance. Tendering his informant a three-dollar bill, with instructions to keep the change, as he should want to whistle by-and-by, and might as well pay beforehand, the disgusted visitor went on his way, resolved never again to make holiday in Boston.

## THE MONTH.

### SCIENCE AND ARTS.

THE cry of 'New lamps for old ones,' once heard in the streets of Bagdad, has, since the invention of the Jablochhoff electric 'candle,' gone up from every city of the civilised world. Lamps, or regulators, carbons, dynamo-machines, and everything pertaining to 'the subtle fluid,' continue to keep inventors busy with improvements, and to baffle patent agents by the family likeness which many of them present. The wedding of the magnet and the steam-engine has been celebrated with so much pomp and circumstance, that the once inevitable battery has been almost forgotten. At one time the subject of no end of

improvements and new forms, inventors seem to have dismissed it as a thing with which further dealing was unprofitable, so far as electric lighting is concerned. One experimenter, however, M. Faure, has not so regarded it; and if all accounts be true, the battery cell must once more in his hands assume fresh importance.

M. Faure's invention consists in a modification of the well-known secondary battery introduced some years ago by his fellow-countryman Planté. This consisted of sheets of lead immersed in acidulated water, which could be gradually charged by means of a couple of Grove's or other cells, and which would give out when required the whole force so stored up. M. Faure's improvement consists in coating the metal sheets with red oxide of lead, by which the capacity of the battery is said to be increased forty-fold. A correspondent of the *Times* describes how he lately conveyed from Paris to Glasgow a charged battery of this description. To use his own words: 'I had the satisfaction of presenting to Sir William Thomson, M. Faure's rare offering of a box of electricity, intact and potent, holding by measurement within that small space of one cubic foot, a power equivalent to nearly one million of foot-pounds.' If this discovery bears out the promise of its infancy, we may possibly soon hear of a Limited Company being started for the supply of condensed lightning to small consumers. The demands of the photographic world alone would insure its success.

Mr Fleuss, whose diving system has already been fully explained in these columns, has recently had the opportunity of demonstrating before the Admiralty authorities at Portsmouth the advantages of his invention both for submarine work, and for use in exploring places full of smoke or noxious gases. For half an hour, Mr Fleuss remained in a chamber specially charged with the densest and most suffocating smoke it was possible to produce. At the end of that time, he was requested to come out, for it was considered that the test had been sufficient for all practical purposes. The experiment has, of course, special bearing upon the extinction of hidden fires on shipboard; and it is probable that its success may lead to the adoption of the Fleuss apparatus as part of the equipment of every vessel in commission.—The same inventor is projecting the construction of a submarine boat, which will afford no mark for the fire of an enemy, and which will be able to carry on subaqueous torpedo warfare of a most terrible description. Mr Fleuss, by his diving apparatus and his smoke-breathing contrivance, has done what he can to save men's lives. He now proposes with his submarine boat to destroy them wholesale. It is difficult to say that we wish such an awful weapon success; but we may express a hope that, in the future, the general acceptance of the principles of arbitration, necessitated by such an invention, will prove it in reality a boon to mankind.

The Telephone has been enlisted in a new service at Chicago, as an aid to the police and patrol system of the city. Public alarm-stations, resembling sentry-boxes, are established at various points. In case of emergency, a citizen can communicate from one of these boxes to the nearest district office, and obtain what aid he needs. He can, if necessary, lock himself in secure from attack, and at the same time telegraph his

difficulty to the police. Every officer is required to telephone half-hourly the events which come under his observation. Telephonic communication is said to have met with great favour in China, where the difficulties of telegraphic signalling are very great, owing to the language possessing no alphabet.

M. Friedel has introduced a new liquid hydrocarbon, which, according to recent experiments, seems to be possessed of extraordinary qualities. It boils at one hundred degrees Fahrenheit, gives a brilliant white light, unaccompanied by heat; and the slightest puff of wind will extinguish it in case of accidental ignition. The corner of a pocket-handkerchief, or even the finger, can be dipped into it, lighted, and used as a temporary torch without any injury to the novel wick. Owing to the cold produced by the rapid evaporation of the liquid, it would thus seem possible, by means of this new agent, to make one finger serve as a taper whilst sealing a letter with the others.

The *Scientific American* records a remarkable accident which lately occurred in a cavern in Mexico. The governor of the district had, in honour of some American visitors, invited them to a grand banquet in the cave. The strange picnic party numbered nearly five hundred, and they had arranged to pass the night in their subterranean quarters. After dinner, many of them were seized with faintness, and it speedily became evident that the cave, like the *Grotto del Cane* in Italy, was highly charged with some deleterious vapour. The visitors speedily beat a retreat, but not before some of them were almost insensible, and had to be carried out by their friends.

The specification of a patent for obtaining photographs in colour has recently been made public; and although it seems rather too elaborate for commercial use, it exhibits much ingenuity. From a negative, a positive proof is taken upon paper in the usual way; but it is purposely only slightly printed, a ghost of what an ordinary print should be. This serves as a guide for the colourist, who by its aid fills in the picture with broad masses of bright colour without any regard to light or shade, much as a child would adorn a wood-cut with water-colours. The surface now receives a coating of albumen, to protect its tints from the after-treatment. This consists in rendering the paper once more sensitive to light, by floating it on a bath of nitrate of silver. It is then placed once more beneath the original negative, so that the image can be printed in its full vigour above the colour. The print is then toned and fixed in the ordinary manner; and a photograph in colour is the result.

One of the most important advances in photography is represented by the argentic paper recently introduced by Messrs Morgan of Greenwich. Requiring no preparation further than that it receives at the hands of its makers, this paper will prove quite a boon to photographers for the purpose of producing large pictures from small ones. A sheet of the paper, pinned against the wall, receives the image of any small negative by means of a magic-lantern. In a few seconds, the exposure is complete, and the picture, under the persuasion of a simple developing fluid, speedily makes its appearance. This application of the new gelatine process—for the paper is coated with

gelatino-bromide of silver—forms the subject of a daily demonstration at the Royal Polytechnic, London, where a negative measuring three inches across is enlarged to thirty inches by an exposure to light of only seven seconds.

In most treatises on electrical science, we learn that moist air forms a good conductor; and for this reason telegraph lines in a damp atmosphere are subject to loss of current, and frictional electric machines lose their virtue unless warmed up to fever-heat. Professor Marangoni has recently published the results of an experiment which seems to refute this old doctrine. Filling an inverted vessel full of steam, he pushed into it a charged Leyden jar. In five seconds it was removed, and would give no spark—showing that the electricity had been dispersed. But it seems that this silent discharge was due to the film of water formed by condensation on the surface of the jar; for when, on repeating the experiment, the steam-chamber was warmed, so as to prevent such condensation, the charged jar remained intact.

One of those curious little accidents which have so often led observing men to useful discoveries, occurred not long ago in a Berlin feather-dyeing establishment. A feather which had been dyed with one of the violet products of aniline was laid aside on a sheet of paper upon which some ammonia had been spilt. The feather was seen to speedily become green in certain parts, presenting a novel and beautiful appearance. The hint thus given has been taken advantage of in the production of variegated feathers and flowers which owe their peculiarity to the same treatment.

Not many months ago, London householders were all complaining of a sudden and mysterious increase in their gas bills. Letters to the newspapers without number, from aggrieved consumers, more than hinted that the Gas Companies, to suit their own ends, were compassing this by certain suspicious operations at the works. The cause of this undoubtedly enormous increase in the consumption of gas has lately been ventilated in the Report of Mr Heisch—the gas examiner to the corporation—whose attention was specially directed to the question. It seems that before the new large mains were opened from the Beckton gas-works to the city, the old pipes would not bear the pressure desired by consumers without serious leakage and loss to the Gas Company. When the new pipes were completed, increased pressure was adopted; but the consumers were not prepared for it, and roared away their gas unmindful of the new conditions. It may be useful to our readers to note that it is within their own power to regulate the supply by means of the main stop-cock placed at the meter. When this is so set that no flame in the house will roar, the pocket of the consumer will not suffer.

Messrs Richter, of Chemnitz, have introduced a new method of cutting and ornamenting glass, which is said to possess many advantages. German-silver discs are impregnated with diamond dust, and afterwards used in various forms to abrade the surface of the glass. By this means the brittle material can be carved, cut, or otherwise treated without risk of injury. In the form of cylinders, the compound metal will cut holes in glass plates of any required size.

A mania, now almost extinct, existed some years ago for writing long compositions in such small

characters that they covered no more than the space occupied by a sixpence. Later on, a machine was invented which gave a microscopic copy of any writing made by its aid, its principal use being for the purpose of secret despatches. This was superseded, in the Franco-Prussian war, by the micro-photograph, which enabled the copy of a newspaper to be transmitted by pigeon post. The subject has been lately revived in Germany by a shorthand writer executing three thousand words, or rather signs for words, upon a post-card, challenging any one to beat his performance by any other system of shorthand. Subsequently, a prize was offered for the greatest number of words written by any method of stenography upon a post-card. The winner—a student of the Pitman system—succeeded in cramming into the space allotted to him the whole of Goldsmith's *She Stoops to Conquer*, half another play, and an essay—representing collectively 32,363 words!

The ingenious Japanese, who have long been celebrated for the excellence of their paper, have recently used with success belting made of that material in lieu of leather. The increasing demand for steam-machinery in that rising country, gives this new application of paper great interest, especially as, through inefficient tanning, Japanese leather cannot be depended upon for heavy work.

Professor Gamgee—whose name is well known as the inventor of a real-ice rink—has now turned his attention to the production of an engine which works without fire. Any one by holding a bottle of liquid ammonia in his warm hand, will soon find out, by the stopper of the bottle jumping in its socket, that gas is given off at a comparatively low temperature. It is this force that Professor Gamgee uses to propel the piston of his engine. After the work has been done, the ammonia is condensed, and—by a method discovered by the inventor—is returned to the cylinder. Ammonia engines have before been contrived, but have invariably failed.

M. René, of Stettin, has made an important discovery in the art of preserving the woods used in the manufacture of pianos from the influences of moisture and temperature. The wood is subjected to an atmosphere of oxygen which has been charged with ozone by the passage of an electric current. This plan not only is a safeguard to pianos from changes of temperature, but is said to give a rare richness of tone to instruments made of wood so prepared.

Some time after the discovery of the bleaching action of light on the so-called visual purple colour in the retina of several animals, the idea was started that what we call sight may be merely a photographic process. Exaggeration—which always follows the footsteps of any new discovery—soon conceived the notion that the scene last depicted upon the sensitive retina remained there after death, and the notion became current that a murderer might be detected by examining the eye of his victim. Dr Ayres, who has made more than a thousand experiments upon the eyes of animals, and who has succeeded to some extent in obtaining pictures of simple geometric figures, quite negatives this idea. He considers that even under the most favourable results, the dead human eye can give no revelation whatever of the scene it last beheld.

M. Trouvé, whose polyscope for medical purposes has recently been described in these pages, writes to *La Nature* stating that a tricycle of English manufacture driven by electricity has lately been seen in the streets of Paris. Its pace was equal to that of a good ordinary cab. M. Trouvé contemplates the construction of a motor which he believes will obtain a far greater velocity.

The late Fisheries Exhibition at Norwich has brought to the front many inventions having for their object the preservation of fish as food. The importance of bringing within the reach of dwellers in our inland towns a cheap and wholesome food which is provided for them by Nature with such liberality, cannot be gainsaid. Treated with a preservative known as glaciale, a salmon and sole were exhibited in a fresh state, although they had been in the building for twelve days. Attention was also concentrated on Knott's Refrigerating Car for the transport of fish from distant places without injury. This last contrivance met with such approval at the hands of the jurors, that they awarded it a gold medal, a diploma, and a prize of twenty pounds.

According to Professor Huxley, who at this Exhibition lectured on the Herring, the numbers of that fish were so vast that it was impossible to conceive any human means which would make any diminution in the stock. He said that at one time a complaint was raised that trawlers disturbed the spawning-beds; but the truth was that the trawlers came after the flat-fish, and in doing so, actually prevented those greedy marauders from devouring millions of herring-eggs.

A plan for constructing a railway across the continent of Australia is again being discussed. The chief difficulty seems to lie in the extreme arid nature of the country to be opened up; but it is thought that borings may result in the discovery of water.

A large boiler is being built by the Manchester Steam Users' Association for the purpose of an experiment. It is to be fired, and allowed to get short of water until the furnace-crowns are red hot. Cold water is then to be pumped on them, in order to prove that explosions cannot occur under such conditions, provided the boiler is in good condition.

In this connection, it may be mentioned that some time ago the Institution of Mechanical Engineers appointed a Committee to examine into certain questions of research in matters pertaining to their profession. One of these questions is that of riveted joints, such as are used in the construction of boilers, gasometers, &c. The various methods of riveting are all found to be defective, in so far as that the parts riveted together are very much weaker than the plate itself, the plates being weakened by the holes which are bored to receive the rivets. A series of experiments has now been decided upon by the Committee for the purpose of scientifically testing the question, with the hope of ascertaining the method of joining plates which shall give the least percentage of weakness as compared with the solid plates.

The same Committee have also had before them the question of the hardening and tempering of steel. It is known that if a piece of tool-steel be heated, and then suddenly cooled, it becomes much harder, not only on the surface, but throughout, provided its thickness be not excessive. The

greater the range of cooling, the more intense is the hardening, but at the same time the greater the brittleness of the piece. This quality of hardness is therefore modified to suit the purpose in view, by the further operation of tempering. In this process, the hardened steel, after its rapid cooling, is re-heated to a temperature corresponding to the purpose for which it is intended, and then quenched again from that temperature. The particular point at which to stop the re-heating is recognised by one particular hue, in what are called 'the colours of tempering,' which the steel is always seen to assume in succession as its temperature gradually rises. Thus, if the article in question be a sword, it is heated to a bright blue; if it be a cold chisel, it is stopped at a brownish orange. The above Committee are of opinion that these colours are due to the metal, in the process of the second heating, re-absorbing the gases which had been expelled by the first heating and subsequent rapid cooling; and they propose to make a series of experiments to test this theory.

A very perfect form of incubator has lately been patented in America. The gas or oil flame is so controlled by a magnetic regulator, that the heat can never rise or fall beyond certain points. The eggs are automatically shifted in their places at regular intervals by means of clockwork. Many good egg-hatching machines have now been invented; indeed there is no difficulty about procuring chickens by such means. The real difficulty lies in keeping them alive after they have left the egg. Not even the clever Yankees can contrive a 'notion' to successfully imitate a mother's tender care for her little ones.

An anchor, manufactured by Messrs Parkes and Ross, of Tipton and Liverpool, and known as Liarlet's Anchor, is noticeable for one or two peculiarities. The chief of these is that the stock of the anchor is provided with flukes, the same as the arms. The arms and stock are so fitted that they can move within a range of forty-five degrees. When stowed, the arms and stock lie in a line with the shank. There is a shackle for the cable, and another near the crown for a buoy-rope. We understand that the P. and O. and some other Companies are using the anchor.

Mr James Stewart, C.E., who recently read to the Royal Geographical Society an account of his survey of the district of Lake Nyassa, in Africa, has had an opportunity of testing the quality of the coal formerly discovered on the shore of that lake by Mr Rhodes. The coal, says Mr Stewart, lies in a clay-bank tilted up at an angle of forty-five degrees. It is laid bare over only some thirty feet, is about seven feet thick, and hardly looks as if it were in its original bed. Yet the bed was compact, and full of good coal. He lit a good fire with it, which burned strongly, the coal softening and throwing out gas-bubbles, but giving no gas-jets. It caked slightly, but not so as to impede its burning. On his return to this country, he submitted a specimen of the coal to Mr Cartners, of the British Museum, who reports that it has the appearance of a good specimen of English coal. After combustion, he found that only 1.8 per cent. of ash remained. He had no doubt that the specimen from Lake Nyassa is of the same age as the coal of England.

In the same paper, Mr Stewart refers to the existence among the natives in Central Africa of

the manufacture of iron from ironstone. These natives occupy the district of country between Lake Nyassa and Lake Tanganyika, and are to all appearance a peaceable and industrious people. They told Mr Stewart that their only desire was to cultivate their gardens and work their iron. All the way between the basins of the two lakes he found traces of ironstone, and in places old workings. On one hillside he counted eight smelting-kilns in good order, within a few hundred yards of each other; and doubtless there were, in his opinion, many more. The kilns in use stand about nine feet high, are five feet in diameter at the base, and three feet at the top, and are built of clay plaster four or six inches thick. They will contain nearly half a ton of iron ore. Charcoal is used for smelting.

The largest steam-hammer in Scotland has just been erected by the Messrs Beardmore, at their Steel and Iron Works, Parkhead, Glasgow. Its erection has been necessitated by the rapid development of the steel manufacture, the old-fashioned tools having been found inadequate to cope with that immensely strong new material. The hammer, which has been named 'Samson,' stands on a bed of concrete, formed by mixing iron borings and slag, with cement, twenty feet thick, and weighing five hundred tons. On this bed is a packing of wood, and on this again is placed the anvil-block, forty-three tons in weight—the anvil itself being a mass of five tons more, making forty-eight tons in all. The ram of the steam-hammer weighs twelve tons—which makes the machine nominally a 12-ton hammer. The cylinder weighs seven tons, is four feet in diameter, and is worked at 60-lb. steam pressure. The hammer delivers blows, having a force of between three hundred and four hundred foot tons, with a rapidity which allows the steel to be perfectly worked before growing cool.

The difficulty of transporting boats over a few miles, or even between different land-locks, &c. has often been felt; and in order to obviate this, Mr F. E. Todd, Park Street, The Mount, York, has patented what is called a 'Collapsing Boat Carriage.' It is made of various lengths, is very light yet strong in construction, and when not in use can be packed up in small space and carried in the boat. It appears to be specially useful for the conveyance of long light boats such as those used in regattas, and the transport of which, either by cart or carried by the crew, is always attended with trouble and fatigue, and often with risk to the boat; or it may be used for conveying a boat from one fishing loch to another. The collapsing carriage can be done up for use, or undone, in a few minutes.

#### THE SEA-SHELL MISSION.

In the month of November last, occasion was taken in this *Journal* to draw the attention of our readers to this Mission, the object of which is, by sending little boxes of shells, bouquets of flowers, &c. to the thousands of sick children in the hospitals and poorer homes of London, to give delight and amusement to these suffering little ones, and to brighten their sad surroundings in the great city, far from the fresh breezes of hills and downs, and the beauty of stream and shore. At this season we would specially remind little

seaside visitors of the opportunity thus afforded them of adding to their own happiness by contributing something in this way towards the happiness of other little ones less favoured than themselves. Since 1879 this Mission has distributed 417,103 shells; and any further contributions of the same nature will be gladly received by the Honorary Secretary of the Sea-shell Mission, 24 Richmond Terrace, Clapham Road, London, S.W.

#### NESTLINGS.

O LITTLE bird! sing sweet among the leaves,  
Safe hid from sight, beside thy downy nest;  
The rain falls, murmuring to the drooping eaves  
A low refrain, that suits thy music best.  
Sing sweet, O bird! thy recompense draws nigh—  
Four callow nestlings 'neath the mother's wing,  
So many flashing wings that by and by  
Will cleave the sunny air. O sing, bird, sing!

(Sing, O my heart! Thy callow nestlings sleep,  
Safe hidden 'neath a gracious folding Wing,  
Until the time when, from their slumber deep,  
They wake, and soar in beauty. Sing, heart, sing!)

O little bird! sing sweet. Though rain may fall,  
And though thy callow brood thy care require,  
Behind the rain-cloud, with its trailing pall,  
Shineth undimmed the gracious golden fire.  
Sing on, O bird! nor of the cloud take heed;  
For thou art heritor of glorious Spring;  
And every field is sacred to thy mood—  
The wealth, the beauty, thine. O sing, bird, sing!

(Sing, O my heart! sing on, though rain may pour;  
Sing on; for unawares the winds will bring  
A drift of sunshine to thy cottage door,  
And arch the clouds with rainbows. Sing, heart, sing!)

O bird! sing sweet. What though the time be near  
When thou shalt sit upon that swaying bough,  
With no sweet mate, no nestling, by, to hear  
The bubbling song thou sing'st to glad them now!  
Thy task was done, fulfilled in sweet Spring days.  
In golden Summer, when thy brood take wing,  
Shalt thou not still have left a hymn of praise,  
Because thy work is over? Sing, bird, sing!

(Sing, O my heart! What if thy birds have flown?  
Thou hadst the joy of their awakening,  
And thousand memories left thee for thine own;  
Sing thou, for task accomplished. Sing, heart, sing!)

#### FRANK BUCKLAND MEMORIAL FUND.

The Editor begs to acknowledge receipt of £1 from Mr Tapling, Ringswood, South Dulwich.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
  - 2d. To insure return in case of ineligibility, postage-stamps should accompany every manuscript.
  - 3d. MANUSCRIPTS should bear the author's full Christian name, surname, and address, legibly written; and should be written on white (not blue) paper, and on one side of the leaf only.
  - 4th. Poetical offerings should invariably be accompanied by a stamped and directed envelope.
- Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

## ARE WE A MUSICAL PEOPLE?

THE advance of musical culture in England is not less remarkable than the general progress of the people in material prosperity; and there is more than a seeming correspondence between increase of wealth and development of the æsthetic capabilities of the nation. In the nature of things, they must advance together. Being richer than our fathers, we have more leisure for the cultivation of the higher tastes. When men are absorbed in unremitting toil for the first elements of existence, they have no time to devote to the finer arts. The *utile* is so incessant in its demands, that the *dulce* is almost ignored. What odds and ends of time may be unemployed are spent in neighbourly gossip, or are dozed away in churlish vacuity. Those who have spent some time with farmers and peasants in out-of-the-way districts, know how a dull, unvaried mode of life in the open air seems to stun the finer parts of human sensibility and to blunt the emotions. In our climate, so changeful, and so charged with damp exhalations, the stupefying influences of out-of-door occupation are intensified. Hence the slumber of the rural soul, and its feeble response to the stimulus of art.

Yet, even in the most comatose villages, there is admission that the æsthetic world exists. In the peasant's cot, garish oleographs circulated by the grocer in the guise of an almanac, are plastered on the walls; shepherds and shepherdesses in rude china-ware make the mantel-shelf resplendent with the glories of gilding and carmine; and dogs and cats, of singular mien and maculations, of proportions new to the most advanced comparative anatomist, rejoice young and old with the potter's skill. Along the straight furrow, the ploughman whistles as he walks. Trudging home with empty wain from market, his emotions thawed by fumes of beer, he breaks out into snatches of a quaint chant, that startle one by their utter denial of all that we have been taught of the laws of phrase and cadence. Young voices, too, rouse the village echoes with archaic ditties; for love and hope find melodic expression in Giles and Sally in spite of

hard-worked muscles. At festival-time, fiddles make their feet go tripping with bucolic grace, and even constrain their elders to beat time to the witching rhythm.

All this shows that country-folks have artistic sympathies, but dulled and obscured by excessive physical labour, by the absence of high standards, and by the limited exercise of their faculties. Country-folks are the raw material of the nation, out of which have been elaborated all our artists. As in the most primitive we find proof of musical susceptibility, which grows under education, we must admit that we are a musical people. What apathy exists is evidence of æsthetic starvation; apathy which will give place to energy under the stimulus of proper nutrition.

We see what may be hoped for, in the musical impressibility of town populations. These we know are recruited from country-folks. Though the work of artisans may be hard and prolonged, it does not paralyse the higher powers. In the streets, there are thousands of objects which excite the æsthetic susceptibilities; pictures, prints, sculptures, architectural wonders keep up a reverberation of excitement in the mind. Taste improves, and we find, in the poorest homes, artistic embellishments of a higher order than in the villages. Popular melodies pass from mouth to mouth like an epidemic; so that thousands are singing and whistling them with the simultaneousness of a vast orchestra. Cheap instruments, facile in the playing, furnish musical toys for urchins, and serve to foster what natural ability they may have. The mechanical organs and pianos, which penetrate into the remotest slums and alleys, spread musical culture even among the dregs of the people. They are, in effect, so many perambulating *conservatoires* teaching the masses the most accepted music of the day. No doubt the organ-grinder is a nuisance to many; he certainly has raised black-mailing to a high art; he is often a truculent *Æolus* making an unjustifiable windy war upon us; but, for the poor he is a beneficent emissary from Apollo, bringing rhythmical joys into a dull world. The organ-

grinder is moreover the standing argument that we are a supremely musical people. In his native Italy, he finds no pecuniary response to his varied strains; in Germany, a benevolent police kick him over the frontier; in France, he is reduced to a brass-ticketed mendicant, and allotted by some pious householder to a 'stand' under the *porte-cochère*. In Britain alone dare he give unfettered vent to a wondrous anthology, comprising *La Fille de Madame Angot*, the Row Polka, *Adieu Fidéles*, *Champagne Charlie*, the *Marseillaise Hymn*, the Sailor's Hornpipe, the prayer from *Moses in Egypt*, and the *Blue Danube* waltz. The poorest of the poor find means to requite him with such rewards as induce him to visit them systematically.

The annual invasion of the Germans with their bands is more than presumptive evidence of our love of music. Surely some of us must be even grossly biased in favour of sweet sounds, to pecuniarily encourage the authors of the most appalling combinations of tone ever extorted from brass and wood! With the same consciousness of lofty justice that their brethren displayed in 'requisitioning' the conquered French, the band arranges itself under our windows, and, without parley or prelude, discharges upon us a bombardment of crashing discords, amid which we faintly hear bold *Tom Bowling*, or gentle *Annie Laurie* imploring for mercy. No sooner is the operation over, than the door knocker is struck with a peremptory vigour that shows the 'collector' feels as much right to our money as though he were levying an authorised music-rate!

The English, indeed, must be notorious for their appreciation of sounds, for every nation hurries to entertain us with its 'airs.' Brigands from Abruzzo and shepherds from the Campagna come in troops to minister to our hunger for tone. Who has not been amazed at these savages in blue mantles and sheep-skin jerkins, with legs bandaged by strips of dirty calico, and feet shod with straps of leather fastened with complicated thongs? Why do they come with piccolo and bagpipe, with dancing boys and girls like palpable ghosts of the old pagan world, if not attracted by rumours of our frantic adoration of music? Judging from their numbers, brigandage and shepherding are poor professions compared with that which supplies the *Inglese* with musical refreshment?

The amount of money that vagabond minstrels from the continent carry annually from Britain must be great. It has been stated by numerous inquirers into the ways and means of these people, that the daily earnings of the organ-grinders are from four to five shillings a head. The bandsmen probably do not obtain much less. As none of the tribe is wanting in effrontery, and as all are smilingly alert, there is no chance lost of getting something out of us.

Besides foreign itinerant musicians, a very large number of natives devote themselves to amusing the uncritical public. They belong to the night-side of city life, and their patrons are chiefly the *habitués* of the public-house. Many of them make a better income than skilled mechanics; but it is wasted in the low debaucheries that are inseparable from Bohemian modes of life.

The number of music-halls in every large town is further evidence of the inclination of

the lower class for musical performances. There are many of these wholly supported by the labouring poor. The songs are not such as charm refined ears; but now and then *morceaux* from the operas are given, which elicit much enthusiasm. Comic songs are most approved, especially those depicting episodes in humble life or the sporting world. But the sentimental and the patriotic are not wanting in the *artistes'* repertoires. The orchestra is often limited to a piano and violin, and tempestuous quadrilles and noisy overtures chiefly fill up the intervals of the vocalists' programme. Vulgar as the entertainments may sometimes be, compared with 'Monday Popular Concerts' or the 'Subscription' Concerts of the higher classes, there is yet, upon the whole, little that tends to debase the hearers.

The middle class furnish overwhelming testimony that the English are musical. In every house there is an altar devoted to Saint Cecilia, and all are taught to serve her to the best of their ability. The altar is the pianoforte. In no other country is there anything like the vast multitude of piano-players that reside amongst us. In Germany, the land of master-pianists, we find the number of amateur players comparatively few. Some certainly deserve to be reckoned among the *virtuosi*, for massiveness of understanding and power of execution. Probably our most skilful and gifted amateurs are inferior to them, for the English want that complete absorption in art which characterises the German mind. But apart from exceptionally great players, we have a much greater trained musical public than Germany; and the reason is, because our middle class is much more numerous and far more wealthy. The most unimpeachable criterion of the greater diffusion of musical culture amongst us is given in the price of musical publications. Nowhere are they so cheap. During the past thirty years the musical press has been as active as the newspaper press. The advancing culture of the middle class has stimulated publishers to issue all the masterpieces of the world at prices so low, that only an enormous sale could justify the ventures. For a few shillings we can purchase the most perfect editions of Beethoven, Mozart, Mendelssohn, Schubert, and Weber, with all the difficult passages fingered. Now, to play the music of the masters mentioned requires years of practice, sound instruction, and above all, a deep love of music itself. Making every allowance for fashion, for desire to shine in the drawing-room, for all that is extraneous to art, there remains immense proof of musical devotion in the young ladies and gentlemen who study to do justice to such subjects as the *Moonlight Sonata* and the *Songs without Words*. Only hard work and sustained ambition can enable us to interpret such compositions; and certain it is that they are admirably interpreted by thousands.

It is well to observe in passing, that the works of Beethoven, which many of his contemporaries considered madly extravagant and unmeaning, are now as highly appreciated in England as in Germany itself.

But our pianists are not so numerous as our vocalists. There are in town and country thousands of choral singers, whose musical knowledge enables them to render the most difficult compositions. In this department of the art we also excel. The Oratorio is almost exclusively an

English institution. It was amongst us that Handel found appreciation, and his sublime strains never fail to delight and exalt us, however often repeated. The gorgeous 'Festival' given in his honour triennially at the Crystal Palace is unique in musical history. Mendelssohn wrote *Elijah* and *St Paul* for us; Costa found fame and fortune in giving us *Naaman* and *Eli*; and Sullivan has steadily advanced to the highest success by following the lead of Handel. The triumph he achieved at the recent Leeds Festival is memorable even in these musical days. Every year there are several great festival performances, which bring together multitudes of singers and hearers from remote parts of the country. It is admitted by capable foreign judges that for beauty and power of voice, our choristers are unsurpassed by the best singers of the continent; and their musical ability is also admitted to be very high. The middle class indeed simply vindicate for their country a conspicuous place among the musical nations of the world.

Our great soloists are, if possible, more distinguished than the choristers. The names of Reeves, Lloyd, and Santley recall some of the most thrilling of our musical experiences; and such ladies as Clara Novello, Sherrington, and Patey have won reputations wide as the world. Sacred music could not have more exquisite interpreters than these. As artistes they are unsurpassed; sweeter voices never were heard; and in fidelity to the theme, they display a judgment as profound as their art.

As patrons of the Italian opera, the aristocracy have deserved well of the general community. Wealth and rank were needed to foster that costly exotic in our gloomy clime. From London the circle of culture has widened, until it has reached the extremities of the United Kingdom; and now the opera has become almost a native institution. It is impossible to estimate the influence of the artistes from Covent Garden and Her Majesty's Theatre in their concert tours through the provinces. They have brought the opera, as it were, into remote towns, and left a standard of vocal art behind them, that has permanently raised the taste of the district. Mozart, Rossini, Verdi, and Gounod have become more familiar to the inhabitants of our shires than they are to their own provincial countrymen.

There are many who say that all this is merely a proof of musical receptivity, and that we take Italian and German operatic airs as we do French fashions of dress. They say that we have no real genius for the opera, and that the evidence lies in the absence of great native composers. It is vain to place Balfe, Wallace, Sullivan, and a few less conspicuous writers, forward as proof that England is not wholly dependent upon foreign talent. Our adverse critics deny the writers named, any originality. Now, it is quite true that the opera is the spontaneous creation of the fervid soil of Italy. Yet it does not follow that it cannot be produced by musicians of other countries. Mozart, Weber, Meyerbeer, Auber, and Gounod have enriched the world with masterpieces so superlative, that the Italians enjoy them as much as the productions of their own brethren. Wagner is acknowledged, by those competent to give an opinion, to be the greatest operatic composer living; and he, we know, is not an Italian.

In other fields of creative art, the English are endowed with genius far beyond that of the Italians. In intellect and emotion, we do not fall short of the greatest peoples living. British poetry, fiction, and painting are in some respects in advance of those of other nations. We must remember, too, that Raphael and others made Italy glorious when our pictorial skill was utterly barbarous. Dante preceded Shakspeare, but he did not surpass him. It is therefore impossible to pronounce a final judgment upon the capability of British operatic composers. If no great work has yet appeared, there is ample evidence extant to show what our composers can do. An analysis of the opera shows that it is made up of arias, concerted vocal pieces, recitatives, and accompaniments. But who that is acquainted with our ballads, glees, quartettes, and choruses will refuse them their undeniable claims to beauty of form, to soundness of scholarship, to originality of conception? All that is wanted is a genius sufficiently powerful to combine the elements into the organic compound called an opera. The late Prince Consort, who was a man of high taste, wide culture, and also a musician, combated the notion that we are not a musical people. His knighting of Henry Bishop, and general encouragement of British musical talent, had a large influence in promoting our artistic welfare, and his name deserves to be venerated by all musicians.

With respect to English opera, it is well to remember that it has had to suffer under great discouragement. Fashion has favoured the Italians. English managers and artistes have lost enormously in attempts to make native operas a success. And though a great and salutary change has taken place in the past decade, yet a young composer would find it hard to get his works introduced upon the lyric stage. Still, hope has dawned upon us, and time seems only needed to make English opera a thriving institution. Musical culture is no longer limited to the well-to-do. All children are under instruction, for singing now forms part of the education given in primary schools. Hence, whatever genius is contained in the masses will have opportunities and furtherances never before known. A musical public is rising, that means nothing less than the whole inhabitants of Britain. From it will proceed such ample and discriminating patronage as must make a musical career highly remunerative to composers and artistes alike. The near future will probably show that we are not only a musical people, but one of the greatest among contemporary nations.

## THE FORTUNES OF BERTRAM OAKLEY.

BY JOHN D. HARWOOD.

### CHAPTER XXXIII.—MR CRAWLEY THE CLERK.

THERE was bustle and stir in the busy Yard of Mervyn & Co. where the steam-saws, with their jagged teeth, that seemed to eat their way through the stoutest timber, glided or revolved; where mallets rang gaily on the oaken ribs of wooden yachts, and sharp hammer-strokes tingled and clashed as they forced in the bolts of the iron steam launches and light craft destined to float their way up African and American rivers; and where, with an encouraging word for the indus-

trious, and a power even over the veriest time-servers and skulkers there, who did their best for a bit after 'Mr Bertram' had passed by, Bertram Oakley seemed the mainspring of the whole mechanism of the place.

There are those who seem born to be loved, who are called, after a fashion of semi-conscious affection, by their Christian names, behind their backs, and perhaps with the ceremonial prefix of 'Mr' appended; and Bertram was one of them. He had been but a short time Assistant Manager; and already the many underlings who drew the pay and did the bidding of Mervyn & Co., looked, in cases of doubt or difficulty, far more to this young man, so lately come among them, than to his titular superior, the Manager, who was respected, but not liked. 'Mr Bertram can do it'—'He'll settle it, Mr Bertram will,' became proverbial sayings among the shipwrights. To be sure, Long Tom and the reinforcement of hammermen and carpenters from Blackwall had sung their young leader's praises loudly enough; and Bertram's easy victory over the river pirates who had captured the *Golden Gate* was magnified by Southampton rumour into gigantic proportions; but in the main, the men judged as much by what they saw as by what they heard; and they obeyed the new Assistant Manager with a willing obedience, like that of soldiers for a captain they can honour and trust.

It was not only among the men who plied mallet and plane and clinking hammer that Oakley won golden opinions. The clerks respected him; and Mr Weston himself, convinced by the inexorable logic of facts, began to consider that Mr Mervyn's usual sagacity had not, in the selection of this young man for a post so arduous, been at fault. Mr Weston's family, at whose house Bertram was an almost daily guest, had no doubt whatever as to the wisdom of the principal's choice. Esteem and liking appeared to be the natural atmosphere that surrounded the youthful Assistant Manager of the famous Yard; but there was one exception, not unimportant, to the general chorus of approval. Bertram had not the good-will of, was not liked by, Mr Crawley the head-clerk.

Mr Crawley was no common clerk. He belonged to the Confidential variety of the species, high up in the official hierarchy. An excellent accountant, steady, punctual as the sun, and with a real aptitude for figures and finance, Mr Crawley had been for several years a well-paid subordinate of Messrs Mervyn. He had hoped to be more than Chief or Confidential Clerk. He had coveted that place of Assistant Manager to which Bertram had been appointed; and bitterly, if silently, did Mr Crawley, who was a man of middle age, resent the early promotion of his junior. Mr Crawley in the flesh was stout made, high-shouldered, and puffy, with a white flat face, that the smallpox had not improved; with hair and whiskers that were red; and peculiarly bushy eyebrows, that were red too. At school, he had borne the nickname of Judas; perhaps as much on account of his looks as of certain treacherous propensities of which he was accused. He was a down-looking man, furtive, unpopular; but strong in the excellence of his moral character and his clear head for accounts. What was most remarkable about the man was his eye—round, pale, cold, cruel—such an eye as we see in the parrot or in the cuttle-

fish—an organ good to see with, but unsmiling, unsparkling, without sympathy—a merciless eye. If it has any expression, this eye of Mr Crawley's, the expression is a malignant one, as, from the window of his solitary room, he watches Bertram cross the Yard.

Bertram Oakley, all unconscious that Mr Crawley, like a thing of evil, was eyeing him with no friendly scrutiny through the glazed side of his little official lair, passed on towards the workshops; and had not long been lost to sight, before there came a half-stealthy, half-swaggering footstep on the crisp gravel without, and then a tap at the door. In response to Mr Crawley's 'Come in,' the door opened, and there entered a man, over-dressed, bejewelled, dark, sallow, fierce-eyed—a hawk masquerading in peacock's plumage, so to speak.

'Well, my buck!' said the visitor, with a familiar nod and a careless wink, as he swaggered across the room towards a chair, whereon he seated himself, laying his glossy hat on the pile of ledgers beside him, and tapping his lackered boots with the point of his gold-headed riding-stick. Mr Crawley jumped with unwonted alacrity from his padded armchair, and hurriedly drew down the blind, so as to prevent any one without from scrutinising the aspect of his guest.

The guest, who marked the precaution, sneered perceptibly. 'You are caution itself, Henny,' he said. Now 'Henny' is not a customary familiarity for that plain Christian name of Henry, which improves by its being changed into the more dashing Harry; but Mr Crawley was never styled Harry in his boyhood.

'Men of business,' said the Chief Clerk sententiously, 'have got to be cautious.'

'I daresay you have, old fox!' was the insolent reply; and then the two men looked at one another in silence.

'You ought not to have come here, really, now, Nat! On my honour, you ought not!' said Mr Crawley, with a suppressed energy that brought a tinge of unwholesome colour into his white face.

'Your honour, eh, Henny!' sneered the visitor, who took and maintained the lead in the conversation. 'But what, old chap, makes you ashamed of me? These togs I wear, do they come out of a Jew-clothesman's bag? Is my hat seedy? Are my boots open at the seams, or my gloves out at the finger-tips? Men cut their chums when these signs of poverty become apparent; and quite right too. But I am a swell.'

'It's not your get-up, Nat—it's the face of you—your walk—your behaviour,' explained the Confidential Clerk. 'Why couldn't you wait till I called in at Radley's—or the S. W.—to ask if you were there?'

'Because I wanted to hurry matters on a bit, and to spur on your laggard spirit to a quicker pace,' answered the visitor, stroking his long moustache. 'You are the tortoise, Henny; and I am the hare, as I used to tell you in our old school-days—and many a drubbing I gave you then—long ago, at Dulchester Grammar-school.'

These were no agreeable reminiscences of boyhood's cheery hour to evoke; but a third person, had such been present, might have conceived that the visitor spoke in accordance with a set purpose,

and deemed it necessary to assert a superiority which was probably based upon his possession of greater audacity and a bolder bearing than the other could boast.

'We won't quarrel,' said the Confidential Clerk, with a ghastly smile. 'As Peachum said to Lockit?'

'Either of us could hang the other!' broke in the man who was called Nat, completing the quotation, and in a tone of quaint good-humour. 'It's little good we ever got, Henny, out of the grand affair, years ago, that was to be the making of us both. We are getting on in age, and still your advice is the same—don't kill the goose that lays the golden eggs, stingy as the goose is.'

'Not unless you are sure of a golden store worth your trouble,' returned Mr Crawley, in a low, cautious voice. 'But what brings you here to-day, Nat? Your courtship, I suspect, does not prosper, or you would scarcely have run the risk of coming here, where *he* might recognise you.'

'You mean that confounded young Oakley?' demanded the other, with a frown and a stamp. 'Not that I'd wish the fellow harm, if he were not always in my path. A plague upon him! He has got to possess some strong influence over the girl. Twice I've seen them together, talking too earnestly to mark me, as I watched them from among the trees of the Avenue. And Miss seems less scared too, when I try to speak to her, as if she had plucked up spirit to defy me.'

'Ay, ay!' said Mr Crawley, rubbing his sleek hands together with a stealthy air of suppressed enjoyment.

'It's not that I'm jealous, Judas, if you mean that by your smirk and your hand-rubbings,' rejoined the dark man roughly. 'This Rose is but a bit of a girl, who might fancy anybody she pleases, were it not for the fortune that goes along with that mite of a hand of hers. With my marriage certificate in my grip, I could walk up to a moneyed party who shall be nameless, as if I held a pistol to his head, and say—'

'Stand and deliver, I suppose,' struck in the Chief Clerk, with his sniggling laugh. 'Not forgetting halves, eh, for your obedient, humble servant, here? We must not sell the bear's skin, though, before Bruin is brought to bay. Come; we are in the same boat, and our interests are identical. You, too, hate this upstart, that has been put over my head, and—'

'For the matter of that, I don't,' interrupted Nat bluntly. 'I look on the thing in a business point of view. The lad did me a good turn once. So have old mates at Bendigo and California; and yet it came to knifing and six-shooters at the dividing of the plunder. Not that bowies and pistols are wanted here,' he added, seeing the dismay that was written in his pacific confederate's face. 'No, no, Judas; you needn't fear my importing Californian customs among you quiet home-staying rogues, whose first requirement is a safe skin. What nice, snug, little game can that sly brain of yours suggest, to get rid of this Bertram, who thwarts my matrimonial projects, and stands, old boy, in your light?'

'Leave that to me. I must think it over. You, Nat, were always one of the violent ones; but I got on best in the long-run—didn't I?' returned Mr Crawley innocently, and with the

hideous grin that with him did duty for a smile.

'I think you did,' answered Nat curtly. Vagabond, swindler, robber-rascal as he was, the man was not quite so heartless as the plausible reptile with whom he talked. He was bad, lost, a reprobate, perhaps with more upon his conscience, more ghosts to haunt his bed at night, than had respectable Mr Henry Crawley the Confidential Clerk. But he was not such a whited sepulchre, nor was he all bad. He could remember good deeds done, here and there—an enemy spared, a rescued child, a widow's desolate hearth made warm, some deeds of mercy, some bits of generosity, when Nathaniel Lee had dollars in his pocket, and prospered much.

When had Henry Crawley done a pennyworth of good to the world, beyond the exercise of his admirable skill at accounts? His name was down on many printed subscription lists for charities—'Mr H. Crawley, two guineas;' but these gifts were advertisements of the respectability of the man. Compare the two together, by the all-searching light of perfect truth, and Nat Lee would have appeared as an angel, in comparison with the decorous scoundrel by his side.

'Do get away. He may drop in; and rely upon it, smart Fitzgerald will seem just the same to him as Nat Lee. He has the eye, I tell you, of an eagle,' exclaimed Mr Crawley, as he lifted a corner of the blind and peeped out. Bertram was not to be seen.

'All right; I'm ready. Call in at the *Railway Hotel* any time to-morrow,' was the sullen answer; and the adventurer half slunk, half swaggered away.

Five minutes after the sallow face, and sable moustache, and glittering watch-chain of Mr Nathaniel Lee—or Fitzgerald—had vanished from the Yard, Bertram Oakley came in, a bundle of papers in his hand. 'Mr Weston wished, Mr Crawley, that you would enter in the books these orders for materials—elm, oak, and iron plate. Here is the docket. The names and addresses of the dealers are here.—Ah, there is the bell!' For, just then, the iron clangour of the call to leave off work resounded, and the Yard was full, as by magic, of swarms of wrights, smiths, navvies, each with his empty tin and handkerchief that had contained his dinner bundle, bustling his way homewards. Bertram, too, left the Yard, last of the departing swarm, passing on through the wide High Street towards the Bar and Portland Place, to pay his almost daily visit to his kind friends the Westons.

## VEVAY IN SUMMER-TIME.

UPOON a certain morning last August, after much thunder, many vivid and magnificent displays of lightning, and rains such as occur only in Switzerland, I wended my way through the somewhat narrow but very clean streets of Vevay, to the railway station—a walk of about ten minutes from my hotel, *The Château*. This house, *L'ancien Château*, is worth a word here. It is a large, massively constructed building, with an immense high-tiled roof, overhanging the walls four or five feet. Early in the last century, it was the residence of the Bernese governor, the Bailli of Bern, one of those Baillis who with a posse of soldiers marched

off the public-spirited Bonivard to the prison of Chillon, the incident of whose imprisonment has since been made familiar through Byron's *Prisoner of Chillon*. The *Château* is in the principal street, the Rue d'Italie. Its entrance-hall is so large that a carriage might be driven into it. This hall has a vaulted ceiling, and runs through to a fine shady garden, with a raised terrace, overlooking the lake, and sheltered from the sun by some fine old plantain trees. At each side of the hall are various small chambers with vaulted ceilings, that may have been used in old times for offices or guard-rooms. A wide stone staircase conducts to the first floor; on this and the floor above, a corridor extends from front to back large enough to give a ball for a hundred people. Right and left, along a transverse corridor, are handsome rooms, some of them enormously large. The *salons* are very unique, the floors being of beautiful and highly polished marqueterie, and the walls and ceilings handsomely panelled with native walnut.

Charlotte de Lengefeld, who afterwards became the wife of Schiller, lived in the *Château* in the years 1783 and 1784 with the family of the Bailli Lentulus. She had an extraordinary love for Switzerland, and talked of its beauties even on her deathbed. Schiller, who never visited Switzerland, was, by her graphic and enthusiastic descriptions, induced and enabled to write his *William Tell*.

After my ten minutes' walk, a ten minutes' ride by rail lands me at St Saphorin, close on Lake Lemman. How beautiful the morning is! All Nature rejoices in the genial sunshine. I think myself a very lizard in my enjoyment of the sun, as I look at these lively little reptiles careering about the walls. There are also lovely butterflies—sulphurs, clouded yellows, tortoiseshells, painted ladies, fritillaries, whites, browns, and now and then a beautiful stranger—flitting about the path, and sipping in crowds at the moisture left in the ruts by last night's rain. A delicious odour—so Swiss-like—from the vines, the wild-flowers, the trees, and the hay, fills the air. Everything conspires to lift up the heart with a joyful ecstasy.

The station where I step out of the train is quite on the margin of the lake. A hundred yards off, boldly placed on a rock overhanging the water, is an old, partially castellated *château*—a picturesque irregular group of buildings. A quarter of a mile farther on, lies grouped on the side of the hill, with singular picturesqueness of form and colour, the village of St Saphorin. A main street runs through it; and various narrow sinuous alleys diverge in different directions, full of the quaintest bits—overhanging roofs, balconies, outside staircases, dark arches into underground caves, with here and there a bit of old traceried window, or an arch thrown across, connecting house to house. Here I set my easel, and finish a sketch begun a day or two before; the villagers who cluster round taking great delight therein, as they recognise old Madame So-and-so shelling beans on the doorstep, with her neighbours sitting and standing about gossiping with her; and *là voilà*, Madame Somebody-else washing her salad at the public fountain for dinner. These Swiss *villageois*, from the youngest to the oldest, are always very courteous, pleasant, and intelli-

gent, and generally become quite friendly when a visit is frequently repeated to the same spot.

Packing up, away we go back along the same road, then diverge up the hillside to the village of Rivaz, sufficiently high to give a commanding view over the country and lake. The village consists of a considerable cluster of houses, lofty, rugged, and massive enough for castles, with deeply recessed windows, cavernous doorways and yawning archways to the caves beneath, where, as is the custom in these Swiss villages, the cows are kept. Wine and milk and honey are the trio of good things most bountifully produced on the banks of Lake Lemman.

Onward and upward I walk until I pass the last house, refreshed by the shelter from the hot sun which the tall edifices have afforded. There I terminate my walk, resting in the shade, on the wall by the roadside. As I sit there, an involuntary exclamation escapes from me: 'What a perfect heaven of beauty and delight!' Above, is the serenest and bluest of skies, the glorious sun pouring down without obstruction its life-giving light and heat; the latter tempered by a delightful breeze, which always blows from the lake to the land in the daytime. Round the far distance extends a panorama of mountains, in tender pearly grays, soft blues, and violets, some of the higher masses draped with snow, looking mellow and golden in the sunny haze. To the right are the mountains of Savoy; then the Valais, with the splendid mass of the Dent du Midi guarding the valley of the Rhone. Continuing on are the Grande Colombière, the Dent de Morcles, the Grand Moveron, and the top of the Diablerets peeping over the mountains behind Villeneuve; also Chillon and Montreux, near the far end of the lake.

The beautiful expanse of water occupying the middle distance, whose shores have oftentimes been tinged with blood, now lies shimmering in the sun like a huge valley filled with liquid opal. As the breeze plays over the surface, like a sportive and lightsome fancy, it is changeably mottled with silvery gray, tender blues, and brilliant emerald green. The lovely expanse is flecked here and there, near and far, with the graceful sails of bark and boat. How unspeakably lovely and beautiful, how calm and peaceful the whole scene, strengthening the tired brain, and cheering exhausted nature! The hillside, covered with vines, slopes up from the water; and there, amongst the vineyards, is a little 'God's-acre,' with its weeping willows, cypresses, and monuments—fit reminder of the past and the future. In the immediate foreground is a vineyard, with men, women, and children working therein with careless content and laughter. The land looks bare and stony; but it appears to repay with luxuriant abundance the care of its people. In the vineyards grow quantities of Indian corn, giving graceful waving lines amongst the vine-leaves; also groups of kidney-beans clustering up long sticks, flushed with scarlet blossoms. Wherever anything will grow, something is planted. What an allegory of some life experiences there is in bread and wine! Wheat is sown in soil suitably prepared, and with very little further care the abundant harvest is reaped. The vine, from before the bud appears on the stock, to the gathering of the vintage, requires and receives attention

and care. In the one case, nothing but good results from maturity; in the latter, with some good, there results not a little of evil.

The increasing power of the sun reminds me that mid-day is at hand. By-and-by, the tolling of the village church bell, with a fine old sonorous sound, speedily followed by the bells of the numerous villages about, certifies that mid-day has arrived, and that it is time to hark back to Vevay. Turning regretfully from so fair a prospect, I descend the hill to the level road, along which I take my way; the lake on the right hand, the vine-clothed mountain-slopes on the left, with the peasantry dotted about, pruning amongst the rows of shrubs—fine stalwart men in white linen trousers and shirt only; and the women all wearing the decent broad low-crowned straw hat, as a shelter from the sun. It is when the people are at their daily work that one sees what is so becoming to themselves, and at the same time satisfactory to artistic instincts—namely, a costume appearing like a part of the nature of the wearer, betraying no awkwardness, but as suitable and ornamental to the spot as the moss and lichen which decorate the old stone wall. In the fields of my own part of Lancashire, between the Ribble and the Mersey, there is the handsome, sturdy, brawny armed young woman, with dark-blue linsey skirt, with pink, blue, or buff shortgown, rolled up to the elbows, and sun-bonnet, with its broad flaps flying back in the wind. She is a picture. Here you have the universal broad straw hat, the dress open at the neck for coolness, the younger women often adorned with clean white frilling round the neck.

Sauntering along the very hot road, I arrive at a small wayside *cabaret*, the sign upon which informs the public that wine is sold here, and that 'if you enter you shall taste it.' I sit down in the shade and order a taste—a small *carafe*, a fifth part of a litre, for which I am charged twopence. The wine has a slight and pleasant acidity, like a scarcely ripened grape. I ask the serving damsel if the wine she vends is grown about there. 'Oui, Monsieur; it is grown on the hillside opposite.' I find it cool and refreshing. Then, on I go, amidst sights and sounds and odours giving pleasure to every sense, renovating the fibres of body and mind, in the loveliest weather imaginable, until I arrive at Vevay, rather overcome with the heat in the latter part of my walk.

Resting in my chamber until the middle of the afternoon, I suddenly find the sunshine has vanished; a great gloom has come on. Presently there are noises and commotion; clouds of dust are careering in the air, window-shutters in all directions are crashing and smashing. I think I will go out and see the lake, which will be rough in this wind. On the way, I meet my daughter, rushing into the house with extended hands and fingers, and eyes wide open with fear and excitement, to tell me a boat is upset, and two people are drowning. I run out on to the quay in front of our garden terrace. What a change! The water is green with its anger and fury, the spray flying from the crests of the rushing waves, great masses of water tumbling against the sea-wall, and dashing over the roads. The wind rushes with hurricane violence; great masses of black clouds roll about and obscure the opposite mountains, amongst which the lightning flashes and the

thunder roars. The fine Vevay lifeboat, manned by nine men, is breasting the storm on the way to where the wreck is supposed to be. In the distance we presently see the Veytaux lifeboat on the way; and several other of the larger boats start off, at great peril to their crews. Many of the pleasure-boats anchored along the quay-side, have sunk at their moorings—that is, they float water-logged, every wave washing over them.

The *espianade*, which is six or seven hundred yards long, is lined with people in great excitement. Some say there were two men in the boat; others, that there were a gentleman, lady, and child. Many tears are shed in excited pity. Towards evening we get at the truth. The steamer *Simplon* arrives, having made its voyage from Ouchy around the other side of the lake. Shortly after leaving Evian, they espied something unusual on the water. Bearing down towards it, they found a boat, bottom upwards, with four men on the keel. They were hauled on board, restoratives given to them, and shortly after landed at their village, Meillerie. As the steamer approached, the shore and pier were covered with people. The population of the village had turned out, and kissed and hugged the men with joy at their escape from a watery grave. Not very long ago, four crews of fishermen, of four men each, were proceeding down to the lake from one of the water-side villages. The weather looked threatening; and first one and then another advised them not to put off. They replied: 'If we don't fish, our families must fast.' However, one crew turned back. The storm came; and of the twelve men remaining, eleven never returned. The three boats were swamped, and only one of the men was saved. He was found in the middle of the night insensible on some stones at the edge of the water.

And so this summer day of striking light and shade on the banks of the Lake of Geneva, is ended.

## OUR PETS.

### IN THREE PARTS.—PART I.

FAR away in our northern home in the Shetlands, we were always taught to regard the lower animals with tender respect and kindly sympathy—I had almost said with reverence. We were taught and we learned to love them, and to make friends and companions of them. The head of our house was passionately fond of them, and to watch and study their habits and idiosyncrasies was his delight, and became ours also. Many an animated discussion and argument we had about their faculties, and it was accepted as a general principle amongst us, and stoutly maintained, that their intellectual and moral powers differed from man's not essentially, but only in degree. We held that man had no right or title to claim a monopoly of reason which manifestly he did not possess; and so we repudiated the common practice of slumping under the convenient term *instinct*, those faculties in the lower animals which are called intellect or reason in man. As no real difference could be shown or proved, we argued it was most inaccurate and illogical to make or assume such a difference by giving a distinctive name to one and the same thing. If they can be shown—as we held they

could—to be endowed with reasoning powers, why not call them reasoning powers? Why say it is all instinct? Every trait, every incident which might be observed, bearing upon our favourite theory, was noted and commented upon. Examples of more than ordinary sagacity, reflection, or foresight, were eagerly rehearsed as affording unmistakable proofs of reason.

Shetland is a locality exceptionally favourable to the keeping of pets. There is ample scope. Neighbours impose no restrictions on the ground of nuisance, for they are almost always the reverse of near neighbours. Pets, especially of the feathered tribe—of which there is a vast variety in the islands—are obtainable generally at no cost whatever. Provisions in abundance are, for the most part, easily procured, and cheap withal, as one has only to call in the aid of rod or fishing-line or fowling-piece to stock the pet's larder on the shortest notice. The winter climate is remarkably mild; and lastly, there is a plentiful supply of water, salt and fresh. Add to these natural advantages of the locality that in our case, far from any limitation being put to the number and variety of our pets, we were not only permitted to keep as many as we chose, but were always encouraged in every possible way. The small inclosures about our house, the paddocks, and the garden, were always at our command. Corners of the out-houses were sometimes allowed to be appropriated, and any quantity of stones and turf was at hand and available. We did the building and tendance ourselves, and many a comfortable little dormitory we built for our pets. The thing most difficult to procure was wood; for no timber grows in the islands, and in the days I am speaking of, when I was a boy and our pocket-money scanty in the extreme, we were often put to our shifts for wood, which was very expensive. But we were always on the look-out for pieces of driftwood, and not unfrequently were fortunate enough to pick up after a gale in one or other of the numerous little creeks—vernacularly *gyos*—around the coast, a plank or piece of broken spar washed off the deck of some passing vessel, and that was always regarded as a great prize. Many a time did we scramble down steep and slippery precipices of one or two hundred feet to secure such a prize, and never did we pass the *gyos* without a look for something of the kind. If our eye fell on the smallest scrap of wood a few feet long, and no thicker than a man's arm, tossing about in the broken water, down we clambered, with a few yards of fishing-line always carried on the chance of such opportunities. A stone was tied to the end of this line, and standing on some slippery rock with the sea surging around us, cast after cast was made over the miserable, bruised and splintered, perhaps worm-eaten waif, till it was brought within reach of our hands, and secured.

I well remember two of us making a grand find in this way. It was a fine fresh spar, which after much dexterous manœuvring, we landed safely in the *gyo*. The next thing was to get it up the precipice of two hundred feet. The plan we adopted was this. We doubled the line for strength, and tied it round one end of the spar. My companion—a servant boy about my own age—climbed up with the slack of the line as far as it would reach. Having secured a good footing, he hauled

up the spar till it reached his hand, and then held it firm and steadied it, while I made my way up to its lower end, which having supported in some convenient niche or projection of rock, Magnie proceeded upwards to another vantage point, and hauled up as before. And so we crept upwards bit by bit. When not far from the top, a sudden exclamation of warning from Magnie made me glance quickly upwards. Right above me I saw the spar slipping through the loop. I had barely time to swerve a little to one side when down went our prize with a crash amongst the rocks far below. It was an exceedingly narrow escape, for if it had struck me—and it passed me within a few inches—I must have been carried down with it to certain destruction. I was a boy then, and never thought of that, but only felt disappointed at so much labour being lost. Nothing daunted, we followed the spar; and our second essay was more successful. That spar was converted into couples for the roof of a splendid house for several of our pets. This is how, often at the risk of our lives, we were wont to get wood. In lieu of slates, we always used turf, which we thatched with straw.

In giving a short account of our principal pets, domestic and domesticated, I should begin with by far the noblest of all the lower animals, and discourse of our dogs. But as space would fail me if I should attempt to enter upon so wide and interesting a field, I shall merely say, that there were generally two or three dogs of different breeds in the house—Newfoundland, retriever, Scotch terrier, or collie, as might happen. I have always given the preference to the last-named variety, perhaps because, at a very early age, I became the proud master of one. He was the constant companion and friend of my boyhood and later years, the most faithful, affectionate, and intelligent of his species I ever knew. With the utmost ease I taught him every useful and ornamental accomplishment. He understood and obeyed my slightest wish or command. As a sporting dog, he was invaluable; while he lived and retained his vigour, I never needed another—pointing, hunting otters, coursing rabbits, retrieving on land or water, according to the exigencies of the occasion. Anything and everything of the sort he took to with a promptness and accuracy of appreciation that never failed. His sagacity saved my life once when in utmost peril, as your readers who have read the Story of Rolf, already know. Dear old fellow! little wonder his memory is green, associated as it is with my happy long ago. We never chained our canine pets, that being regarded as a barbarous and cruel practice.

We always had an unlimited number of cats amongst our pets, each member of the family—by no means a small one—being the master or mistress, as the case might be, of at least one. I could say many things about cats, and plead in their behalf many powerful arguments for more generous and kindly treatment than they often receive, but I forbear. The generic term always applied to cats in our circle was *Mirza*, which had originated in an observation of one of our family, that like the hero of Addison's inimitable 'Vision,' they seemed to be continually falling into 'a profound contemplation on the vanities of human—or shall we say feline?—life.' From that day forward, cats were always spoken of as *Mirzas*.

Once we had an otter amongst our pets; a funny, active, energetic, little fellow he was. The dogs and he were excellent friends, and it was exceedingly interesting and entertaining to watch them at their sham battles-royal, which took place almost every day. Worrying at each other's throat, locked in each other's embrace, and with no small pretence of seriousness, as evidenced by the fierce din and terrible exhibition of teeth, they rolled over and over on the lawn, till one of the combatants would lose his temper, and perhaps snap rather viciously; then they would slowly and decorously separate, apparently thinking they had had enough of the rough sport, and it would be prudent not to prolong it. Once our pet otter gave us a great fright. All the members of the household had retired to their rooms and were preparing for bed, when we were startled by a series of the wildest shrieks proceeding from the servant-girl's bedroom. In the full persuasion of finding the house on fire at the very least, we all rushed frantically to the scene of alarm, where we soon discovered the cause of the hubbub. One of the girls, never very remarkable for strength of nerve, had jumped into bed, gathered the blankets about her, and shoved down her feet, which came into violent and unexpected contact with *something* which clearly had no legitimate business there. That something was our pet otter. His comfortable slumbers thus unceremoniously disturbed, he had, naturally enough, seized with what was very much the reverse of gentleness, the big toe of the offending foot, and certainly left his mark there. It was not to be wondered at that the poor girl got a great fright, although I am happy to say it was not followed by such disastrous results as she anticipated when she protested hysterically that she would never get over it—never! The intruder was of course relegated to his own proper dormitory amid peals of unrestrainable laughter.

Twice we had a tame seal. What fellows they were to eat! A few hundred sillocks—young of the suite or coal-fish—barely served them for a meal; but after a short time, when they became quite tame, they fished for themselves in the sea, always returning to their comfortable quarters in one of the outhouses. The fate of one was tragic. On one of his hunting expeditions he had apparently roamed beyond the limits of his usual haunts, and lost his way in a snow-storm. Landing several miles from home, he was making for the nearest fisherman's hut, when he was met by some thoughtless lads, who knocked him on the head, converted his blubber into oil, and his skin into *Rivins*—the vernacular for a kind of moccasin made of untanned hide. When taxed with the murder of our pet, the rascals pretended they thought it was a wild selkie driven on shore by stress of weather. The other seal, after thriving splendidly, and growing fast and fat, suddenly refused food, got dull, would scarcely stay a minute in the sea which had formerly been his delight, and after pining away for three weeks, died. A post-mortem examination discovered a considerable quantity of gravel in his stomach, which there could be no doubt had been the cause of death. He had swallowed it with his food, which had been thoughtlessly thrown on the floor of his house. We were very sorry when we lost

our pet seals, for they were intelligent, gentle, and affectionate creatures, and albeit their movements on land were ungainly, it was delightful and refreshing to see them disporting themselves in their native element. And their eyes! such eyes! they were simply the loveliest I ever saw in any creature—large, dark, liquid, and lustrous, with a wistful, pleading, melancholy expression that went far to justify the local legend which represents them as a certain class of fallen spirits in metempsychosis, enduring a mitigated punishment for their sins. The seal has a way of looking right into your eyes, as though asking for sympathy and kind treatment. It makes one feel pitiful towards them, and I wonder exceedingly how the sailors who make 'seal-fishing' in the polar regions their trade, can have the heart to knock them on the head with a bludgeon.

But our principal pets were of the feathered tribe, and I pass on to say something of them. I should have mentioned that we gave names to all our pets, beasts and birds. Our patriotism, and consequent partiality for everything Norsk, led us to prefer those of Scandinavian mythology or history—Odin, Thor, Baldur, Sigmund, Harald, Rolf, Ronald, Ingeborg, Dagmar, and the like. The great Wizard's charming romance made Pirate and Norna and Minna and Brenda great favorites; other names were suggested by some peculiarity of appearance or trait of character in our pets, or some circumstance connected with their capture or early life. Thus two ducks that always selected for their nest a spot amongst some long grass on the bank of a little stream, and year after year, in the most friendly and sisterly manner, incubated side by side, were dubbed Bessie Bell and Mary Gray. A splendid gamecock of impetuous valour and unconquerable prowess, received the distinguished name of Cœur-de-lion. A burly pigeon remarkable for the inconstancy of his attachments and the number of his wives, was Henry VIII., and his mates were of course namesakes of that monarch's consorts. A gull recovering from the gunshot wound which made him a prisoner, but deprived him of an eye and a pinion, was Nelson. A raven—simply, I suppose, because he was black—was Othello. And so on. Thus we were never at a loss for names. The individuality which close observation soon discovers in animals even of the same species is truly wonderful; the variety is just as great as in the genus *homo*. It was a common practice with us, therefore, to change the original name into a characteristic one.

Of fowls, ducks, geese, pigeons, we had a goodly number; but in making pets of these, there was one considerable drawback. It was against the rules to transfer any of them to the larder, despite the old cook's loud, and I am afraid sometimes contemptuous protestations against the sentimentality which refused to permit Bessie Bell or Mary Gray, or Cœur-de-lion, or the Templar, or Henry VIII., or any of their families, to be converted into roast duck, even when the peas were temptingly green, or boiled fowl or pigeon-pie, when not a scrap of fresh butcher-meat was to be had for love or money—a thing by no means of unfrequent occurrence in our island in those days. How could one sign the death-warrant of the affectionate and confiding creatures that flew to you whenever you appeared for the

crust of bread or oatmeal cake with which your pocket was always well supplied, and whose characters and dispositions you had been making an interesting study? To dine or sup off one of our pets was not to be thought of. *We* could not have done it; and happily our father would listen to no appeals in that direction. He peremptorily refused his permission, and no one dared to attempt surreptitious slaughter. The only thing allowed was an occasional exchange with a neighbour, and even that was only in the case of young birds—chickens, ducks, or geese.

Multiplying of the stock was certainly not encouraged, rather discouraged indeed; but the adults were allowed to live and roam about in peace, and to die of old age or by accident as chance might befall.

It will be understood from this that our poultry-yard birds—which, though I give them that name, were never confined to any such limits as a poultry-yard—were the reverse of profitable. Eggs we had certainly in tolerable abundance; but that was about all. Owing to the predatory practices of raven and hooded crow, the only kind of fowls we were able to keep was the game variety, and these were always safe. If chanticler was at hand, these rapacious and wily robbers did not dare to attack one of his wives or progeny. They perfectly understood the clear note of defiance which challenged them to the combat. Even the hens in the absence of their natural protector never failed to give battle when attacked. Once a venturesome raven pounced upon some chickens, but was fiercely met by the mother-bird. Her lord and master, the redoubted Cœur-de-lion, not far off, hearing the scuffle, flew to the rescue, and instantly closed in mortal combat with the audacious assailant. The battle was furious, but brief and decisive. The raven was hurled senseless, with outspread wings, into a ditch close by; and the cock's 'shrill clarion' proclaimed him victor. Our father, who witnessed this rencontre, ran out; and not till within a few feet of the raven, did the latter gather himself together and make off.

## HORSE-BREAKING IN THE BUSH.

FROM AN AUSTRALIAN CORRESPONDENT.

'RUNNING-IN' a 'mob' of some sixty or seventy head of horses is a thrilling and exciting scene, especially as they have, perhaps, hardly seen a human being for months, and have been running wild in the Australian Bush. They have thus become somewhat frisky, and are quite able and willing to lead one a good chase, if they are disturbed and pursued. Of course, the greater number of these are horses that have been broken-in, and know the way to the stockyard; but naturally, they have no wish to proceed thither, if they can avoid it. On the other hand, there are also a good many foals and yearlings, two-year, and even perhaps a few three-year old colts and fillies that have not yet experienced the sorrows of being under the yoke of and subject to man.

Riding out leisurely in the morning through the Bush, the stockman takes the direction of the 'run' usually frequented by the 'mob' which

he wishes to find, keeping a sharp look-out for either the horses or their tracks. He is not encumbered with many superfluous articles of dress, his rig-out consisting simply of a cotton or woollen shirt, with white moleskin pants, incased below the knee in brown leathern leggings; a broad-rimmed white felt hat on his head, a pair of spurs on his heels, and a white handkerchief, folded in the form of a scarf, and tied loosely round his neck, complete his rig-out. He also carries in his hand the omnipresent stockwhip, without which the stockman rarely ever goes forth; and bestriding a lively active horse, which steps briskly along at a smart walk or amble, and upon the slightest irritation from the spur, breaks at once into an easy canter, which does not weary the rider whose business may possibly keep him in the saddle from shortly after sunrise until sundown.

Proceeding along in this manner, he pays little attention to the beauties of nature in the glory and splendour of an Australian summer morning, with the sun shining in all the brightness of a cloudless sky, and warming the clear dry atmosphere of the shady forest; now riding up a sandy ridge, covered, it may be, with pines of every size, from the youngest shoot, rising only a foot or two above the ground, up to the towering tree which rears its head from a hundred to a hundred and fifty feet in height, rising in lofty grandeur with the tall, rough, trunked iron-bark with which they intermingle. Among these are also dispersed knots of wattle-bushes in all the brightness and luxuriance of their yellow blossoms; and here and there a group of slender myrtle-trees clustering closely together, and a chance stray iron-wood for variety.

He now passes on through a strip of bendee scrub—smaller trees, but much more numerous, each giving out innumerable branches, which approach those of the neighbouring trees so closely, that the rider requires to duck and dodge, in order to prevent his being caught by them and pulled from his horse. As he proceeds, he disturbs numbers of beautifully plumaged doves, and gorgeously arrayed parrots, that scream as they fly swiftly past. The hoarse screech of the cockatoos is heard as they flap slowly along above the tallest trees in groups of three or four, or the harsh and grating demoniacal laugh of that curious bird the laughing-jackass, as it keeps a sharp watch for snakes.

The stockwhip, without which no stockman's accoutrement is complete, consists of a thong made of plaited green hide (bullock's) from ten to fifteen feet long, to the lower end of which is attached a plain strip of hide about eighteen inches in length by a quarter of an inch in breadth, called the 'fall.' To this is fastened the lash or cracker, usually made of silk or twisted horse-hair, the latter being the commoner, as it is more easily procured in the Bush. This extensive thong is attached to a handle made of hard, heavy wood—such as that taken from the heart of the bendee, or the myal tree—which is thick at one end, but tapering at the other, and not more than a foot and a half long. However, when the stockwhip is skilfully handled on horse-back, whence, of course, it is only intended to be used, and 'dropped' upon a bullock's back, it is a truly formidable weapon; and when it is cracked

in the air, it gives a report almost like that of a gun. Some, indeed, are so expert with it as to be able from horseback to kill a snake, or even so small an object as a fly creeping upon the wall.

After our stockman has ridden for some four or five miles in this manner, the forest opens out into a small treeless plain, inclosed on every side by the smooth gray trunks and dark-green leafy boughs of the rather plentiful box. Here he comes upon fresh horse-tracks, and by following them, soon finds the 'mob' he is in search of. He then rides leisurely round, collecting the horses together, and turning them in the homeward direction, flourishes his whip high in the air, and lets it fall with its usual loud report. Away go the mob at a canter, while he directs them towards the station. Now they whirl across the plain with mane and tail streaming in the wind; and entering the forest of towering box, they rush swiftly up the ridge, and soon reach the bendee scrub, through which they dash at headlong speed. The rider, never drawing rein, follows at the same speed, but alters his position in the saddle; for now he stands in the stirrups, with his body bent somewhat forwards, in order to better escape the overhanging boughs; and holding the bridle with his left hand, he takes a handful of the mane in his right, that he may be able to change his position the more readily. This he is now constantly doing; at one moment bending close down along the horse's neck, to pass under a bough which is perhaps not more than eighteen inches above the horse's back; now leaning out of the saddle to one side, now to the other, to escape the trunk of a tree, round which the horse springs without any apparent guidance on the rider's part, who seems every moment just about to be dashed up against one, yet always escaping. Now he is down again on the horse's neck, dodging a bough; and before he has time to raise himself, his well-trained steel bounds over one of the logs, with which the ground is pretty well strewn. Thus he continues with all his faculties on the alert, until horse and rider dash out once more into the open forest, now composed of tall magnificent iron-barks, which stretch far up towards the blue sky. And here our stockman is able once more to resume his seat.

You may well imagine that these vicissitudes require that the rider should have a quick eye, steady nerves, and a firm seat in the saddle, with a horse also that has been accustomed to the work of going through the scrub at a canter, or even at a gallop.

But now the horses, instead of going straight on, as the driver wishes them to do, have turned off to the left along the edge of the scrub, no doubt intending to move round again in the direction of their 'run,' thinking they have come far enough in this course. But quick as thought, the rider leans forward, and touching his horse with the spur, away it springs like an arrow, and stretches at a gallop along the flank of the mob between this and the scrub; whereupon the stockman, cracking his whip loudly, soon heads them off amongst the pines and iron-barks, and drives down the ridge, towards the station. When the stockyard is reached, the horses trot slowly round it until the leaders are almost opposite the 'slip-panels,' which being removed, leaves the open

gate. Now again the rider spurs his horse, which bounds forward like the wind; and in a few moments he has headed the leaders in through the opening, the remainder following hurriedly. After the last has passed the gate, the rider quickly dismounts, and putting up the 'slip-rails' again in their place, the 'running-in' is complete.

The horse-breaker having now unsaddled and 'hobbled out' his horse on the bank of the creek, where it will be able to refresh itself after its run, with some food and drink, proceeds to draft the colt which is to be broken-in, from among the other horses, into one of the several smaller compartments which enter into the formation of the stockyard, these being shut off from one another by means of the slip-panels, which may be taken down at will. The colt being secured alone in a yard of some forty or fifty feet square, is caught by means of a head-rope made of plaited hide with a noose at one end. This noose, supported on the end of a long slender pole, is slipped over the head of the frightened animal, and immediately pulled tight upon its neck by one or two assistants, who are stationed outside the yard, as one man could scarcely cope successfully with the bewildered colt in its mad plungings. The only effect, however, of its fruitless endeavours is to tighten the noose more securely on its neck, rendering its respiration laboured and gasping, and thus quickly exhausting its strength. At length when, finding escape hopeless, its struggles become fainter and its resistance less determined, the head-rope is slackened, allowing it to regain its breath. The horse-breaker still having hold of the rope, and remaining at a respectful distance from the always easily alarmed and irritated yet somewhat quieted horse, now rubs its body and legs with the pole, used previously in roping it, till it becomes more accustomed to, and less afraid of being touched. After this, discarding the pole, he approaches it quietly, and patting it gently, talks to it in a soothing manner; then being handed a halter slyly from behind, so as not to disturb the nerves of the young horse, he slips it gently upon its head; and then hobbles its fore-feet together.

Now comes, perhaps, the most difficult and dangerous part of the proceedings—namely, the 'side-lining,' which consists in fettering the near fore and hind legs together. He is, however, enabled to do this more easily by using a leg-rope, which, being fastened on the hind-leg, gives him much more command over the limb. Then drawing the latter forwards, yet not without considerable resistance on the horse's part, by cautious and careful management, though running the risk of receiving a severe kick, he succeeds in buckling one of the 'side-line' straps on this ankle; after which it is comparatively easy to fasten the other upon the fore-limb. The animal now being hobbled and side-lined, the breaking-in-bit, attached to a bridle, is put into its mouth, a girth round its body, and as the motions of its legs are now in a great measure rendered harmless, the crupper can be put on without much danger. When these are all fastened, the head-rope is taken off, and the colt left to its own reflections for the night.

Next morning, a pack-saddle is secured upon its back, and the hobbles and side-line being removed, it is led for a while through the yard. Then the

horse-breaker mounting his steed, rides forth into the Bush, leading the colt alongside, accompanied by another horseman, who assists him by driving on the young horse when it shows any unwillingness to proceed; and who may also render aid should it attempt to break away, or if it run foul of a tree, which last may readily happen, on account of the closeness of the timber. In this manner it is led for a few hours, when the pack-saddle is removed, and again having recourse to the hobbles and side-line, the animal is left to feed. About sundown, it is again inclosed in the yard for the night with the pack-saddle on its back. Next morning, this is changed for the riding-saddle. Then the colt is mounted, and ridden within the stockyard for a short time. This is done partly to prevent the colt 'bucking,' as it will not feel so much its own master while it remains shut in on every side by the high wooden rails of the stockyard, as it would be likely to if out in the wide Bush, with no restraint on its movements; and partly in order that the horse may be unable to get away from, and be the more readily caught again by the rider, should it succeed in throwing him. It is then ridden outside until pretty well tired and quieted, when it is again 'hobbled out,' with a bell hung to its neck, so that its whereabouts may be easily known next day, as it is permitted to spend this night on the grass. The colt may now be considered broken-in. It is not, however, allowed to rejoin its mob at present, but is worked very frequently until quite subdued.

Some horses yield to their fate calmly enough; others refuse to be ridden, and carry on a fierce and vehement struggle in the form of buck-jumping. This may perhaps require a word of explanation. It consists in the horse putting his head between his fore-legs, gathering all his feet closely together, and elevating his back into a hump, so as to form as insecure a seat as possible for the rider, then making 'pig-jumps' in every direction forwards and backwards, to the right side and to the left, and sometimes round in a complete circle—the latter being the most difficult to sit—in its efforts to throw the horseman. All this, however, generally proves fruitless, unless the girth gives way, when, of course, saddle and all will be discarded; but this does not often happen. Occasionally, when the horse finds all its bucking useless, it lies down and rolls on the ground, when the rider steps lightly from its back. But they rarely carry their resistance so far, though buck-jumpers commonly renew their pranks, when quite fresh after a few months' 'spell.'

It is now, of course, only fit for a saddle-horse; but as riding is the general mode of travelling, the greater number are seldom, and some of them never in harness. Should it, however, be desired for a draught or 'buggy horse,' it undergoes its second breaking at any subsequent period when its services may be required. This training is as speedily got over as the former, and is done, for example, by taking a five-horse team, one of them being in the drag-shafts, and the remaining four in pairs in front of it. What I may now call the 'saddle-horse' is placed second on the off-side, where it can do little harm, being in the company of quiet animals. When it has become thoroughly used to this position, it may, if desirable, be changed to the near-side, or to that of

off-side leader. There are, however, two situations from which the now comparatively new draught-horse is excluded, these being the near-side leadership and the shafts. These can only be properly filled by two tractable and experienced animals, which not only know their own name, but also understand the 'language' of the driver. For upon a leader not only depends the movements of his colleague, but those of all the intervening horses between him and the shafts, and to some extent the direction of the drag; and upon the shaft-horse—in some of the larger carriers' drays drawn by a dozen horses, there are two pair of shafts, but the animal on the near-side is always the important one—devolves the duty of steering the dray clear of the close-growing trees. As no reins are used, the horses are guided by the voice, occasionally assisted by slight touches on each side of their neck, according to the direction sought, from a light whip carried by the driver, who either walks or rides beside them as he pleases. It is an interesting sight to see six pair of horses winding their way among the trees, inclining to this side or that at the driver's word.

The training of a horse to form one of a team or to run in a spring-cart does not seem to be regarded as at all forming a part of the breaking of a colt, but is, in fact, quite a secondary consideration. And naturally it is so; for, as we have already said, riding being the almost universal mode of going from one place to another in the Bush, the majority of the squatters' horses are of light make, and so only suited for the saddle or buggy. But as the latter may not be in use perhaps more than two or three times in a year—and generally only for the accommodation of ladies, or when going a long journey, for luggage unsuited to a pack-horse—there is not much need of harness-horses. Then, again, the readiness with which the saddle-horse may be taught to run in the buggy team—four is the usual number—is another point against the necessity of breaking them to this at first. For example, in a journey down the country, the present writer being one of the party, a young horse was harnessed to the off-side of the buggy pole, and the leaders being started, we proceeded on as before. The new member gave some little trouble at first; but by the time it had done its ten miles—which was about the usual distance before changing—it had become somewhat used to its confinement. About thirteen spare horses were driven after the vehicle, with which those in it were changed, from thirty to forty miles being generally the distance covered in a day. Fifty miles is considered about a day's journey on horseback.

## SHALL SHE BE SACRIFICED?

### CHAPTER I.—OUR MYSTERIOUS NEIGHBOURS.

In the little town of Spanners, in a semi-detached villa, lived my Aunt and I. My profession was that of a Doctor, my practice being large for a young man of only twenty-five. The next house had been long unoccupied. Wooden palings divided its garden in the back and front from ours. The garden, however, was totally uncared-for. The grass, unmown for many months, was long and straggling, and overgrown with decayed

leaves, which no one ever thought of removing. Near the gate was a black board, supported on a pole, on which was painted in large staring characters, 'To be Let, Furnished or Unfurnished, or Sold. Inquire at Mr Bleggs, House Agent, 15 Corn Row.' The same information was exhibited in the cobwebbed windows. The owner had been abroad for some time, and possessed a few other houses besides this in the town. At first the rent was fifty pounds per annum. No one would give that for it. It was then lowered to forty, and lastly to thirty-five pounds. Two or three times I noticed people stopping at the gate; but the outward appearance of the villa was so unprepossessing and untidy, that no one cared to take it, and thus it remained unlet for upwards of two years. It was an eyesore to me and to my Aunt; for our side being so neat, and our little garden so flourishing and gay, the contrast was all the more painful. One spring morning, as I was gathering some violets for our breakfast-table, to my agreeable surprise I observed a gardener clearing away the long-unswept leaves, and preparing to mow the long-neglected grass. He touched his cap on seeing me. I asked if the house was let. He replied that it was, and that the new-comers would take possession in a few days. They had purchased the old furniture for a song—so he had heard—and had taken the house by the month.

A pleasing change was soon visible in the outward appearance of the place. The windows were cleaned and made to look bright and shining. Behind them were hung new green venetians, and the door was freshly painted. The dust within the building, the accumulations of many months, must have been great. Indeed, in hyperbolic language, the charwoman engaged told our cook, who told my Aunt, who told me, that there was dust enough to bury a man. I can imagine that the statement could not have been far from the truth. I should not like to have been the unfortunate charwoman; I hope she was paid well for her trouble. About a week after, as I was in my surgery, at eleven o'clock at night, I heard a cab stop. I went to the window, and shading my face against the panes, looked out; but the darkness was too great to permit me to observe the new-comers.

The next morning, our neighbours sent their compliments, asking us to lend them a few coals, which my good Aunt gladly did. We ascertained that the fresh arrivals were a young orphan lady, and her sole servant, a housekeeper. The former's name we were told was Colebrooke. This was the only information my good Aunt could give our acquaintances when they made inquiries. Several people called and left cards; but none were admitted, and so my Aunt thought it would be useless for her to call, especially as we learned that the young lady returned no visits. This gave occasion for much speculation and gossip among the chatterboxes of Spanners, which was one of those places where every one knows every one, and everybody's affairs are canvassed and commented on by the community in general. Miss Colebrooke was a new inhabitant; no one knew her, nor anything about her; and so folks were curious, and being curious, talked. It thus happened that before I saw her, I felt a kind of interest in her. For about three weeks she never went out at all.

What a lonely life hers must be, I thought, knowing none, and known by none, except one old servant. Such a strange thing too it was, for a young girl to live thus by herself. Had she no relations? The postman never left a letter at her door. What a lot, to be left thus friendless and desolate in the wide world!

I caught my first glimpse of her from our breakfast-room window as she was walking in the back-garden one morning. I was at once struck by the elegance of her form. But her face—when I saw that, I felt drawn to her at once, it was so sweet and pure; and there was such a depth of sadness in her soft, liquid, dark-gray eyes! She could not have been more than eighteen or nineteen, as far as I could judge. When she caught my eye, she blushed vividly, and quickly turned away her face, as if not caring to be seen.

The next time I saw her was in church; but she wore a thick black veil, and it was not possible to see her features distinctly. I observed many people eyeing her inquisitively. She had taken a seat with her housekeeper, at the end of the church, amongst the free seats, and behind a pillar; so those who were rude enough to stare had to turn round. Don't think I did so. I glanced at her when I entered the church, but not again. I could perceive she was embarrassed by the curiosity of her fellow-worshippers.

Several weeks passed away, but we and our neighbours became no better acquainted. Occasionally, but that was not often, I saw her either in the garden or at the window; but she never walked out except on Sundays to church. Every morning the housekeeper went into the town to purchase the food for the day. I never noticed any tradesman call at the door; ready-money was paid for everything bought. This circumstance only increased the inquisitiveness of the Spanners. I persuaded my Aunt to call one day, but she had no better luck than others who had done so. The servant told her that her young mistress received no one. The act of courtesy was unreturned.

Some weeks after this, when my Aunt had gone to bed, and I was preparing to do the same, I heard a faint, hesitating ring at the night-bell. Thinking it might be a summons to a patient, I opened the door myself, and was surprised to see Miss Colebrooke.

'You are the Doctor, I think?' she said rather timidly.

'Yes. Can I be of any service to you?' I inquired.

'My servant has been taken very ill with bronchitis. Will you kindly come and see her?'

I said I would come immediately; and putting on my hat, followed her down the steps and into the house. The servant was indeed seriously ill; and the attack was sharp and dangerous. I prescribed the necessary remedies, and left the room, promising to return in the morning.

Miss Colebrooke followed me to the door. 'Is it very serious?' she asked anxiously.

'In such cases,' I replied, 'there is always a certain amount of danger; but I hope, with care, that she will recover.'

'I hope so too, Doctor. I don't know what I should do if anything happened to her;' and the tears rose to her beautiful eyes.

'Would it not be as well,' I said, 'that you should have a nurse to attend her? I could recommend you one.'

'Thank you; but I must nurse her myself,' she said quickly. 'But yes; I forgot,' she added after a moment, as if recollecting something. 'I must have some one to attend to the house and go to the town for me.'

'Just so. Then I will send you a servant to-morrow. Mrs Stonewell, my Aunt, can recommend her highly.'

'You are very kind, sir; but'—

I waited for her to continue. 'Yes?' I said, seeing she did not conclude her sentence.

'I was thinking,' she answered hesitatingly, 'that she cannot sleep here—she must sleep at her home.'

This struck me as strange, as there were enough rooms in the house—which was built on the same plan as ours—for visitors as well as servants. But without questioning her, I said I would request the person to sleep at her own house, and departed.

Mrs Thompson—which was the housekeeper's name—was worse the next day. Her mistress was in a state of feverish anxiety about her. When the woman I recommended came, she was told that she need not attend to the top rooms, as they were locked. While I was there, Miss Colebrooke went to one of these rooms, and I fancied I heard her say something in a low remonstrating tone. Could she be speaking to herself? I wondered. But later in the day I found the rooms above had an inhabitant, and one whom no one guessed could be there. In the afternoon, as I was passing to the hall-door, I looked up on hearing a swift movement above me. I wondered to see looking at me over the balustrade on the top landing the face of a man, beardless and whiskerless, with only a thick black moustache on his lip. He withdrew his head hastily when he saw I had noticed him. Who could he be? I resolved not to raise Miss Colebrooke's suspicions by asking questions, but during my visit that evening, she looked at me very uneasily and inquiringly as if she expected me to question her about the man, who I fancied must have told her that I had seen him. But she said nothing, nor did I.

For the next three days Mrs Thompson continued in a very critical condition. On the fourth I saw an improvement, and on telling Miss Colebrooke so, had the pleasure of seeing the first bright smile on her pretty face. 'I am so glad,' she said hopefully. 'You think then she will get over it? Please, say so.'

I said so, but added that the patient must be very carefully attended, and every precaution taken to prevent her catching increased cold, which would certainly prove fatal. She asked when I thought Mrs Thompson could leave her room. I replied, that it was impossible to say.

'You are looking tired with watching,' I added. 'I hope you allow the new maid to take turns with you in watching by Mrs Thompson?'

'She does a little in the daytime.'

'But why not let her take turns in watching at night?' I pursued. 'It must, I am sure, fatigue you. Want of sleep always exhausts the human frame.'

'Oh, I am strong, Doctor. I can do it.'

'Well, take care then,' I said as I went to the

door, 'that I do not have to doctor you as well as Mrs Thompson; and then we must have a regular hospital nurse.'

'I hope not,' she returned, smiling. 'That would indeed be a misfortune.'

I told my Aunt what I had said to Miss Colebrooke, and with her never-failing kindness, she offered to help in the watching, and I gave Miss Colebrooke the message the next time I saw her.

'How very good of your Aunt,' she said gratefully. 'I feel her kindness very much the more so, as we are quite strangers; and'—

'And,' I concluded, 'I may therefore tell her that her proposal is accepted. You will know her at once, and no one knowing her could help liking her. She would be a friend to you.'

'She must be a charming person, Doctor.'

'Well, I will tell her then that she can come this evening.'

'Oh, please do not! I'— She spoke quickly, in an embarrassed tone. 'But I must watch by Mrs Thompson myself at night. Do tell Mrs Stonewell how very much obliged I am to her.'

'Then, Miss Colebrooke, if you would rather watch by night, you must let her take turns with you in the daytime. I assure you it won't put her out. It will be a pleasure to her.'

This was more favourably received. After some hesitation, she consented; and during the day, I brought my Aunt in, and introduced her. I saw they took a mutual fancy to each other, of which I was glad. My Aunt pitied the apparently friendless girl, who seemed to have no one to care for her but the sick housekeeper. She felt drawn to her as I had been, when she saw the gentle, beautiful face, and divined as I had done, that the young heart hid a sorrow the nature of which we did not know. And on her part, Miss Colebrooke—and who could help it?—was attracted by my dear Aunt's kindly smile, her sweet sympathising words, as well as by her dear loving old face, pretty still, in spite of sixty summers, and many cares and troubles which had furrowed the brow, that had once been one of the smoothest and fairest. She stayed the whole afternoon with Mrs Thompson, and gently insisted on the young girl taking rest while she did so.

### 'DORNBUSCH.'

WHILE the art of printing is primarily beneficial to mankind, by the facility which it affords for the preservation and dissemination of those literary works that are intrinsically valuable for the philosophy and morality which they inculcate, or the knowledge which they convey; yet the art has been serviceable to the world in a hundred other ways, for which no other art is so adapted or so readily applicable. This is especially true of the present century, when the press has been utilised for the advocacy and advancement of every conceivable branch of human industry or skill. There is not a sect or society but has its organ, and scarcely a trade or profession but has its means of appeal through its own literary channels. The advantage of the printing-press as a means of gathering and spreading information, is felt by no class more than the commercial classes, chiefly those of them whose business does not depend so much upon local conditions, as upon the state of the markets throughout the country, or it may be

throughout the greater part of the civilised globe. For such, therefore, the press is invaluable; and there has never been wanting at one time or another some one with the sagacity and practical foresight to render it serviceable for the particular branch of commerce to be benefited.

One of these pioneers was George Dornbusch, the proprietor, editor, and publisher of a privately circulated newspaper, devoted exclusively to the interests of the corn and seed trade. The whole of the work connected with the publication—including the editing and printing—was carried on at South Sea House, Threadneedle Street, City; and, known as *Dornbusch's Floating Cargoes List*, was, at the time of its establishment in 1851, altogether unique, and has since continued to supply information which, to those interested, has oftentimes proved to be of an exceedingly important and valuable character. It was published twice a day: the Morning List giving particulars of arrivals, clearances, and sailings of grain-laden vessels at and from various ports; whilst the Evening Edition contained reports from all the principal markets in the United Kingdom, the continent, the United States, and Canada; together with particulars of the day's transactions in cargoes either on passage or arrival; and remarks concerning the general position and prospects of the trade. The circulation of the Morning List was confined chiefly to London merchants; but the Evening List, in addition to being delivered by hand to a large number of subscribers in London, was posted to many of the principal corn and seed factors throughout the world. The subscription was high; and Mr Dornbusch was at considerable pains to insure the private character of the circular being maintained. Every subscriber was therefore required to sign an agreement to the effect that no unauthorised person should be permitted to benefit by the information given in the *List*; and the right was reserved of cutting off the supply, in the event of such agreement being violated.

The arrangements for obtaining information were both elaborate and costly.—In addition to correspondents at the principal inland centres of the corn-trade, agents were employed at all the principal ports, whose duty it was to telegraph details of all grain-laden vessels arriving or sailing. Thus a subscriber to 'Dornbusch' was enabled to see at a glance what cargoes had been shipped; what vessels had arrived; the latest fluctuations in values; the most recent transactions; and the exact position and prospects of the trade in all parts of the world. Particulars as to sales were not always easy to obtain; and this department was attended to principally by Mr Dornbusch himself, who thus became one of the best known frequenters of Mark Lane, the 'Baltic,' in Threadneedle Street, and other business centres. Certain factors would oftentimes have an interest in the real state of the market being either suppressed, or actually misrepresented, and they would also have reasons for not wishing some particular transaction to be made public; but on these points Mr Dornbusch was inexorable; and neither entreaty nor threat could induce him to withhold from his clients that with which he considered himself in honour bound to furnish them.

The *List*, as has been said, was established in

1854; and up till 1873, Mr Dornbusch was the leading spirit of the concern, having every branch of it under his immediate superintendence. In the early part of 1873, however, he caught a violent cold, which in less than a fortnight proved fatal. But the publication of the *List* was not interfered with by his death; and it is still carried on, being conducted on the same principles as those which marked its institution.

As a man of business, Mr Dornbusch was scrupulously honourable, and thoroughly master of the difficult as well as peculiar position he had won. Seldom, indeed, was he at fault, either in his facts or his deductions; and equally seldom had his clients to regret acting upon his information or taking his advice. That it was necessary to approach as nearly as possible to absolute accuracy in issuing the *List* may be gathered from the fact, that the merely accidental substitution of a '5' for a '3'—thus making a certain cargo appear 5000 quarters instead of 3000, or *rice versa*—might prove to be a very serious affair, as the cargo would probably change hands upon the strength of the bulk being the exact quantity represented. Mistakes *did* occur, it is true, but they were few and far between; and woe to that luckless wight to whose stupidity or negligence they happened to be traceable!

In his private capacity, Mr Dornbusch was a man of much eccentricity, both in habits and opinions. Among other things, he was an uncompromising vegetarian. Not merely was all manner of flesh-food an abomination to him, but milk, eggs, butter, and cheese were rigidly excluded from his table, and his bread was made from home-ground wheat, uncontaminated by either salt or yeast. As a rule, he would eat nothing between breakfast before leaving home in the morning, and dinner upon his return in the evening. When, however, some public engagement would interfere with returning at the usual hour, he would dine at the office; his dinner on such occasions consisting of an immense hunch of brown bread, followed by half-a-dozen apples, or a bunch or two of choice grapes, which, with sundry glasses of water, made up the sum-total of his repast. Dining at home, however, was altogether another affair with him. The writer once had that pleasure. We went into the dining-room, and found the table most tastefully laid; but when the covers were removed, I was more than astonished by what I saw. There were cold boiled potatoes, cold boiled cauliflower, and cold boiled rice, with tomato sauce as a relish, and the aforesaid home-baked brown bread—inno-cent of either salt or yeast—as an accompaniment! The old gentleman ate with amazing gusto, and platful after platful fell a prey to what must have been a decidedly good, if not exactly a voracious appetite. But as for me, I was 'out in the cold.' Every now and again, my host would look across the table, and—with what bore a suspicious resemblance to a mischievous smile—would say: 'Come, I am afraid you are not getting on.' And in truth I was not getting on. I did my best; but my depraved appetite yearned for something more congenial than cold cauliflower and tomato sauce; and I was sorely in danger of starving altogether, until a bounteous supply of luscious fruit appeared on the table, and I was invited to fall to without stint.

Mr Dornbusch's career went far to prove what is possible to a man of strong determination. The state of his health, which was never robust, must have handicapped him heavily in the struggle of city life; and yet, in spite of physical deformity and weakness, he succeeded, not only in starting, but also in prosperously maintaining an enterprise which is still intimately associated with one of the most important branches of the commerce of the world. But what is still more worthy of notice is the fact, that he was one of those men of whom England has so much reason to be proud, who, amidst all the pressure of business life, devote an amount of thought, time, and money, such as outsiders have little conception of, to the amelioration of human misery, and the improvement of our common humanity.

### COPYRIGHT IN CHINA.

At present, after so much has been said and done on the copyright question as regards England and America, it is interesting to learn in what light the people of the Celestial Empire view this question of literary property. While it may be said that there is no statute law of copyright in China, there is on the other hand an 'unwritten law' that is equally effective. From a paper on this subject, read by Mr Macgowan at a meeting of the North-China Branch of the Royal Asiatic Society, Shanghai, we find that on the title-page of newly published books in China, there is not infrequently a caution against their unauthorised publication; showing at once that literary property is liable to be stolen, and that redress is afforded to authors thus wronged. The Penal Code, however, will be searched in vain for an enactment on the subject of copyright. Chinese law, indeed, has never conceived it necessary to specify that particular form of robbery which consists in despoiling a scholar of the fruit of his toil, any more than to name the products of husbandmen and artisans as under the protection of law; all alike being regarded as property by natural right. Hence, those who infringe the rights of an author are liable to a punishment of one hundred blows and three years' deportation if they print and sell his works without authority; but if the trespass has gone no further than printing, no copies having been sold, the punishment inflicted is only fifty blows and forfeiture of the books and blocks. The right of exclusive publication thus protected, is not only vested in the author, but is held in perpetuity by his heirs and assigns. Equal protection is given to inventors and discoverers; the section of the Penal Code that takes cognisance of larcenies of a grave character, acting at the same time both as a copyright and a patent law. The productions of artists also come under its operation; and in all these cases, the rights of the individual in his property, whether it be literary, artistic, or mechanical, are held to be identical in principle, and are treated as equally inherent and inalienable.

This is one respect in which the Chinese are a long way ahead of us. Our copyright law is in many respects ill-defined, and its assertion frequently leads to expensive litigation; whilst an inventor, after perhaps many years' hard work and study, and often the expenditure of not a little money—or time, which to him means money

—cannot have the product of his ingenuity preserved to him unless he is able to pay out a large round sum of money to purchase the protection of our patent law, and this, after all, only for a limited number of years. It is difficult, at first sight, to understand how a country like Great Britain, which depends for so much of its prosperity on the inventive skill of its inhabitants, should yet exact from each inventor what is equivalent to a heavy money-fine before he can have the profitable use of his own invention. This is one department of the state in which there is much room for useful and rational legislation.

### THE CONVENT GIRL.

FAR up the wall, amid the eglantine,  
Her window stood embow'ed in thickest green;  
And oft she came throughout the livelong day  
To sigh, and muse upon the changing scene.

'Twas there the sweetest breath of morning stole,  
And bright-t there the dews of evening lay;  
There wand'ring bees sipped nectar hour by hour,  
And murmured dreamily their lullaby.

From her high seat she saw the shining bay,  
And where the singing river kissed the shore:  
From it she watched the dreary winter pass,  
And longed for summer twilight as of yore.

Once in her eyes a 'witching coyness played,  
Once o'er her cheeks the mantling blushes spread;  
But now on them there lay a winter's snow,  
And from her eyes the glance of youth had fled.

One partner shared the quiet of her room—  
A linnet caged, that flattered all the day:  
She tended it, and loved its merry trill—  
A song of joyous welcome to the May.

'At last,' she said, 'thou long-sought one, at last!  
Thou fill'st the world from brook to sunny sky;  
O Spring, thou thrice-blest daughter of the year;  
O thou who comest when the snowdrops die.

'And May is here—the month of love and flowers:  
One year ago, a weary year to me,  
I know so well the way we used to take,  
And see the moonlight glitter on the sea.

'Heaven knows, I loved him in those happy days  
With all a girl's first love—and *not* too well;  
But in my inmost heart the secret lay;  
And *still* I cherish what I could not tell.

'I well remember how he bade "good-bye,"  
Under the trees beside the glassy river,  
And how he took my hand and drew me near,  
And kissed a fond farewell, as if for ever.

'And thou, sweet bird, art singing of thy skies,  
Thy rills, thy mossy bank, thy ivy tree,  
And of thy mate upon the breezy hills,  
And days that swiftly flew when thou wast free.

'And I, a captive too within these walls,  
Am living o'er again my sunny past,  
And dreaming olden dreams of youth and hope,  
Too sweet, too fair, too ravishing to last.

'Oh, give me one bright hour from out the past!  
One moment of that vanished golden year;  
Oh, break these bonds, and make me free once more!  
'Twere but a living death, a lifetime here.'

## ALCOHOLICS.

BY AN ANALYST.

IN the earlier days of human history, we may suppose the free-will gifts of Nature were sufficient for the wants of man. He lived content with such things as he found, and satisfied his thirst with nothing stronger than a draught of milk; or water, Adam's good old wine. But this golden age of temperance had an end, although when, or how, we know not. This much, at least, is certain, that a long way back in history, either by accident or by experiment, some one discovered how to make fermented liquors, and mankind speedily became acquainted with the properties of alcohol; although the art of calling forth the fiery spirit from its habitation is an attainment of quite modern date.

Forming as it does the intoxicating ingredient in fermented liquors, and having regard to the enormous consumption of these at the present day, alcohol is a substance at once of national importance and general interest. While theoretically obtainable from various chemical substances, practically the whole of our alcohol is derived from starch, sugar, or other saccharine materials; in this country, commonly from grain of various kinds, either malted or unmalted; while in Germany, spirits are largely made from potatoes; in France, from beetroot and carrots; and in Sweden, from the birch and maple.

When barley or other grain is steeped in water till it sprouts, and is then carefully dried, it becomes what is termed malt. By this process, part of the starch of which the grain is mainly composed has been converted into sugar, and a new substance has been developed, known as diastase, a nitrogenous body, which immediately, when the malt is mixed with water, reacts on the remaining starch, and transforms it also into sugar, the liquid consequently soon assuming a sweet taste. We have now, in fact, a solution of sugar, which is known as *wort*; but we may attain the same end by using unmalted grain—potatoes, peas, beans, or other

starchy material, which, by the addition of dilute sulphuric acid, is converted into a soluble sugar. Having thus obtained a solution of sugar from any of these sources, or still more directly from beetroot or the 'toothsome cane,' yeast is added to the wort, and the process known as 'fermentation' is rapidly set up, by which the sugar is decomposed into two chief products, alcohol and carbonic acid gas; and several minor ones, glycerine, succinic acid, &c., ninety-five out of every hundred parts of sugar being transformed into alcohol and carbonic acid, four parts going to form glycerine, &c., and one part as nourishment to the yeast plant, which has multiplied immensely, and now forms a frothy scum upon the surface of the liquid. By the fermentation, spirits have been produced; and the object of the next process, the distillation of the fermented wort or wash, is to separate the spirit from the liquid in which it exists. The produce of this operation is an impure spirit known as 'low wines,' which has to be re-distilled at a lower temperature, to get rid of part of the water and the oils with which it is contaminated; the product of this second distillation being the mixture of alcohol and water known as 'whisky' or 'spirits of wine,' because it was by the distillation of wine that spirits were first obtained. Of late years, however, by means of a modern invention known as Coffey's Still, a purer spirit is obtained by a single distillation than that produced by the double operation with an ordinary 'pot still.'

Alcohol has such a strong affinity for water, that by simple distillation it is impossible to obtain a stronger spirit than one containing about ninety-two per cent. of absolute alcohol; but except for chemical purposes, the pure material is never made, spirits intended for whisky usually ranging from 'proof' to about twenty degrees over-proof, and that produced above forty-three degrees O.P. (over-proof) being classed as spirits of wine. The modern and legal definition of 'proof-spirit is such as at fifty-one degrees Fahrenheit shall be twelvethirtieths the weight of an equal measure of distilled water;' and such spirit contains about

equal parts of alcohol and water. Nowadays, we are very scientific and exact in all our methods; but we borrow our word 'proof' from the olden smuggling times, when the country-folks used to make their own whisky, and test its strength by soaking some gunpowder in it, and on the application of a light, pronouncing it to be under or over proof according as it failed or succeeded in allowing the gunpowder to ignite.

Thus far we have considered merely alcohol, or simple *aqua vite*. But were it simply ethylic alcohol and water which were obtained by distillation, we should have spirits all possessing a uniform taste and character; this is not the case, however, for some of the essential oils pass over with the spirit. Thus, whisky has a flavour due to fusel oil, or to peat-dried malt; brandy, which is made by distilling wine, to a peculiar oil in the grape; rum, which is obtained from molasses, to an essential oil in the sugar-cane; arrack, to an oil in the rice from which it is made; and gin, to the juniper berries, coriander, or orris-root with which it is distilled. Some of these oils are hurtful—fusel oil, for instance; and the difference between old and new whisky is chiefly due to the evaporation of this oil, or its absorption into the cask; although the improvement in the older material may be likewise brought about by keeping in a sherry cask, which gives it a pleasant flavour and a slightly straw-coloured tint. Many people have an idea that the best whisky is highly coloured; but the truth is whisky is quite colourless when distilled, and will remain so, unless kept in a wine-cask, or some artificial colouring be added, as is frequently done to please the public fancy, and deceive the would-be judges of a 'fine old article.' It is rather interesting to know the way in which some of the much-trumpeted 'old whiskies' are compounded. We believe it is no uncommon practice to mix together a few casks of old whisky in a vat, add a cask or two of strong spirits of wine, reduce with water, and add burnt sugar till a fine sherry colour is obtained—thus producing a delightful 'blend,' which goes down with the utmost satisfaction. By means of pelargonate of ethyl, the peat-reek flavour can be imitated; but this is not very commonly practised; and over a glass of some modern blend, many an old Highlander bewails the loss of the smuggled 'sma'-still' whisky of his younger days, so highly esteemed because of its strength, acquired by being carried about in bladders or skins, which allowed most of the water—but very little of the alcohol—to pass through and evaporate; the spirit thus left being much stronger than could otherwise be produced.

Such a whisky, when shaken up in a clear glass bottle, or when poured into a glass, gave a fine bead or bubble; and according as the beads were large and numerous and quickly disappeared, so was the spirit held in popular esteem. But such rude methods of pronouncing on the strength of spirits are as little practised now as smuggling itself. For a time, sets of small hollow bulbs

of glass, called Lovi's Beads, were used, each when it just floated indicating a particular strength, or rather a specific gravity; but now the only legal instrument in use is the hydrometer, on the accuracy of which depends the vast revenue arising from the duty on some thirty million gallons of spirits annually produced in the United Kingdom.

About the beginning of the eighteenth century, the duty upon spirits was twenty shillings a gallon; but smuggling flourished so much in consequence, that a much lower rate became necessary; and after many fluctuations and different scales for the three countries, in 1860 the duty was fixed at the present uniform rate of ten shillings per proof gallon for the whole kingdom; the export trade being encouraged by a drawback of two-pence on every gallon sent abroad; while the import of foreign spirit is checked by a duty of fivepence per gallon. At such a high figure, the duty on spirits of wine would interfere with many industries, and be a serious check to science; but to obviate this difficulty, spirits of wine may be used for manufacturing and scientific purposes free of duty, if containing ten per cent. of wood naphtha, so as to unfit it for human consumption. This mixture of ninety per cent. spirits of wine and ten per cent. wood naphtha is known as 'methylated spirit,' and for most purposes is quite as good as pure spirit. Under the name of 'Finish,' the same article is allowed to be retailed provided it contain three ounces of shell-lac or gum-resin dissolved in every gallon of the spirit.

In the manufacture of wine, the 'must' or expressed juice of the grape is simply set aside in vats, and fermentation is allowed to take place naturally—in the case of red wines, the skins being left to ferment with the juice, as they contain a large proportion of colouring matter. The sugar of the grape becomes converted into alcohol; but where there is a large amount of sugar present, some of it may remain unchanged, thus yielding a sweet or 'fruity' wine; while one in which all the sugar has been fermented is known as a 'dry' wine.

The cost of a wine appears to bear no relation to the amount of spirit in it, but to depend upon the *bouquet* or peculiar flavour given by ethereal salts produced by the acid and alcohol in the wine; and the chief object of adulteration is to imitate this characteristic flavour. For this purpose, the Greeks use turpentine or resin, just as the ancient Romans used pitch or tar; and most of the cheap champagne sold in this country is prepared from gooseberry wine. The flavour of Moselle is imitated by a tincture of elder-flowers; while extract of sweet-brier, orris-root, almonds, cherry, and laurel water are largely used for producing various artificial bouquets. The astringency of wine is imitated by oak sawdust or grape-seeds; while the 'crust' of wine is now no reliable indication of age; for if a bottle of new port be put into hot water, and afterwards placed in a cellar, it soon deposits a crust like that of years; and when well cobwebbed, the deception is complete.

People in this country fancy that the same variety of wine should have one uniform flavour and colour; but frequently it happens that through deficiency in sunshine or some other cause, the produce of one year is much lighter in

colour or poorer in bouquet than usual; so, to satisfy the popular idea, some additional flavour is added, and the colour is made up by various ingredients. In Portugal and Spain, many plants, such as blackberries and bilberries, are cultivated solely for this purpose; and in one year, Spain alone imported three hundred thousand pounds-weight of elder-berries to be thus employed. But besides these, logwood and Brazil-wood are quite commonly used for colouring red wines, especially port, the sophistication of which is so proverbial. For the manufacture of the artificial article, spoiled cider is largely used; and in Hamburg, large quantities of it are made from materials which have never seen Oporto. In like manner, 'the vine-clad hills of Bingen' do not yield anything like the quantity of wine which is produced in that old town 'beside the castled Rhine.' So at Cotte, in Normandy, there are large works which unblushingly hang out the sign, 'Wines manufactured here.' At this place, great quantities of sherry (!) are prepared for the English market from a cheap white wine, which is 'fortified' with brandy, coloured up with treacle, and flavoured with almonds. Although we must in fairness admit that the sherry we import is not invariably so doctored, we are not exaggerating when we say that scarcely a single natural sherry reaches this country, almost all the stronger wines, sherry, port, Madeira, and many of the light wines of France and Germany, being more or less fortified by the addition of spirit before exportation; the alleged object being to arrest fermentation, and so avoid souring, as well as to make them stand the voyage; while many of them are still further fortified upon arrival in this country.

Although sherry is the only wine admitted into the pharmacopœia, port is quite as frequently recommended by the medical faculty; but so seldom is good port to be obtained at anything like a moderate price, that brandy for a stimulant, and Madeira for its nutritive value, are much preferable. The best of the cheap wines are those of Hungary and Bordeaux (clarets); and of the effervescing wines—those bottled while fermentation is still proceeding—the white champagnes are generally purer than the pink, there being much less cover for adulteration in the former.

Brandy is usually supposed to be obtained by distilling the fermented juice of the grape; and the most esteemed quality is that produced in the district of Cognac. But alas! comparatively little of the so-called Cognac now comes from that quarter, much of it being brandy made from the red wines of Portugal and Spain, and also from the refuse of the wine-press; while a large percentage of the brandy sold in Britain has been originally 'raw grain' whisky manufactured in Scotland and sent to the continent to be doctored. Like whisky, brandy is quite colourless when newly made; but when kept in wooden casks, it acquires a light sherry tint from the colouring matter of the wood; and this is frequently deepened by the addition of burnt sugar, to adapt it for the public taste.

Gin or geneva, which takes its name from *genièvre*, the French for juniper, is made by distilling ordinary spirit with juniper-berries and other flavouring materials, the essential oils of

which pass over with the spirit, and is an article largely consumed in London. Like most alcoholic liquors, it is seldom retailed unsophisticated; the quantity obtainable for a few coppers being sufficient proof to any one of ordinary perception and intelligence that it is watered to an enormous extent. But mere dilution is not the only way in which it suffers; for on the addition of water, the liquid becomes turbid, owing to the precipitation of the flavouring oils, thus necessitating an addition known as 'the doctor.' This usually consists of alum and carbonate of potash with some additional flavouring material, whereby the gin is again rendered bright and palatable.

Beer—which may be termed the national beverage of England—should be made entirely from malt and hops; and such is the beer brewed by the leading English firms, which is so famous all the world over. In the manufacture of beer, the process is to some extent identical with that for making spirits; but for beer, the wort is boiled in large copper vessels with the necessary amount of hops; and the character of the beer depends in great measure on the malt, hops, and water used in brewing, and the careful management of the wort during fermentation. Pale and amber coloured malts are used for brewing bitter beer, table beer, and pale ale; whilst a darker variety is used for sweet ale; and a quantity of black or charred malt for stout and porter. For the successful preparation of pale ale, the finest Kentish hops, and a very hard water containing a large amount of earthy salts in solution, are both of the utmost importance.

In the brewery, though inferior articles may be used, beer is seldom doctored. It is on the retailer's premises that it suffers such adulteration as the addition of water, sugar, treacle, liquorice, caramel, picric acid, *Cocculus indicus*, alum, salt, copperas, chalk, soda, &c.; and there are very few publicans—in the Metropolis at least—who do not use some one or more of these ingredients, to 'suit it to the tastes of their customers.'

The amount of alcohol present varies greatly in the several liquors of which it forms the intoxicating ingredient, rum containing about seventy-five per cent.; whisky and brandy averaging about fifty; port-wine, twenty; sherry, fifteen to twenty-four; Madeira, nineteen; claret, ten; champagne, fourteen; cider, six; ales and porter, from six to twelve; and abstainers will probably be surprised to learn that *all fermented drinks* contain alcohol, ginger beer, &c., usually containing from one to three per cent. of it. Indeed, total abstinence from alcohol would seem almost an impossibility, for even milk contains small quantities of it; and in bread-making, it is produced in considerable quantity by the action of the yeast upon the sugar in the flour; the aggregate amount of spirit thus produced in London being some three hundred thousand gallons annually. Some chemists go the length of asserting that even water itself is not entirely free from it!

It is quite beyond the purpose of the present paper to discuss the much-debated temperance question, or to touch upon the interesting lore connected with the drinking customs of the various races and ages of mankind; and if perhaps in these remarks we have revealed one of the darker sides of human nature, this much may be confidently asserted, that at least the leading manu-

facturers of our national beverages, beer and whisky, can be thoroughly depended upon for producing the genuine unadulterated article. And while consumers of our own home produce have this satisfaction, let them, at the same time, be mindful of the good old maxim, in their alcoholics as in all things else, to observe the happy mean of moderation.

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER XXXIV.—THE HEIRESS.

BERTRAM OAKLEY, when he reached the Westons' house in Portland Place, and was shown, as a matter of course, into the drawing-room, found it empty. The windows were open, and, among others, the French-window opening upon the broad shallow stone steps that led to the garden, then in its pride of summer-bloom. The ladies—so the servant who admitted Bertram, said—were at home. But the first of these who entered the room was Miss Carrington. And Miss Carrington was ever gracious, in these later days, to Bertram Oakley. It was no trilling compliment, on the part of the proud heiress, to be gracious to a young man. That brilliant young amazon, armed in the double panoply of her charms and her cash, having a masterful temper and tolerable brains, was apt to snub, twit, and harass the opposite sex on every available opportunity, and had caused some honest, stupid admirers, higher placed than Messrs Mervyn's Assistant Manager, to spend some miserable half-hours under fire of her mocking eyes and irritating remarks. But towards Bertram, her manner had strangely softened.

'You are tired to death, Mr Oakley, if you would only confess it; but you are too thorough a Spartan for that,' said the fair Julia. 'You have been dreadfully busy, I suppose.'

'We are always busy, Miss Carrington, in Mervyn's Yard,' answered Bertram, smiling.

'I wish I were a man!' said she, rather inconsistently, and perhaps a little insincerely, for very pretty girls seldom repine at the impossibility of a change of sex. 'If I were, I might be of some good in the world, and win a name and distinction, as I am sure you will do, Mr Oakley. But men must work, and women must weep, as the song says, to the end of time, I fear.'

'Work is wholesome for us; and you, Miss Carrington, have, I hope, little reason to weep,' replied Bertram.

'How can you tell that?' she asked, with a ring of melancholy in her modulated voice, and a drooping of her half-closed eyelids, the long dark lashes of which fell to her rounded cheek, as she propped her graceful head on her gloved hand. She had risen from her chair, and was now standing, leaning against the corner of the marble chimney-piece, a great vaseful of ferns making a background to her beautiful face, as she looked down upon Bertram with all the witchery of art and loveliness combined. There are young ladies who regard this attitude as irresistible; and indeed the *pose*, if well managed, is a fascinating one. Even Bertram could not help remarking to himself how very handsome was Julia Carrington; but he bore the battery of her dark eyes, for so young a man, well. Perhaps his own freedom from vanity, the honest

purpose that never slumbered in his breast, served as a shield against the artifices that have humbled many a warrior and sage and statesman since the days of Vivien and Merlin.

'How little you men know of women, or their feelings, or their hearts!' continued Miss Carrington. 'You have your ambitious, your pursuits, which are apart from ours; and when our sympathy tries to follow you, you smile superior, as though we were but children of a larger growth, unworthy of your confidence. As for us, you appear to consider that if we have good homes, and new dresses, and amusements, we must be happy. It would be our own fault, I suppose, if we are not.'

'I should have thought you happy, Miss Carrington,' replied Bertram, rising from his chair; 'for you are young, and rich, as I have heard, and have so many friends.'

He could not speak of the patent and notable fact of her beauty, because, in these plain-spoken and uncomplimentary days, it trenches on the confines of love-making to do that, and to flirt with Julia Carrington was wholly foreign to Bertram's thoughts. So he used the safe word—friends; and Julia felt a little annoyed, and beat upon the carpet with the tip of her well-booted foot, partly, perhaps, because, by getting up, Bertram had got away from under the raking artillery of her dark-glancing eyes, and spoiled the advantage of her carefully studied attitude.

'Friends! yes,' she retorted petulantly. 'No doubt of that. When one is rich, as you tell me that I am, Mr Oakley, one seldom finds a dearth of friends. How would it be, if I were poor!'

'I am poor, and I have found very kind ones,' answered Bertram, with his quiet smile.

'You—you are a man, with a career before you, and that is so different,' said Miss Carrington. 'We women find our only possible happiness in merging our own wishes, our own hopes, in those of another, and?—'

At this moment, in came the two Weston girls, with their honest, good-humoured faces, and their prattle about the events of the day and the gossip of the town; and very soon afterwards their mother entered; and thus a stop was put to Julia Carrington's psychological dissertation on the tastes and aspirations of the sex whereof she was an ornament; nor was Bertram sorry that the conversation should become general and commonplace. There had been, indeed, something slightly embarrassing in the persistent desire of the fair Julia—not now evinced for the first time—to entangle him in that species of talk from which it is difficult to emerge without saying something silly, at best. And Bertram, who was no coxcomb, attributed to the mere idle desire of conquest the palpable wish of the heiress to bring him, as a wooer, to her feet. The thing did not vex him much. It did not amuse him at all. He owed her face to be very fair, and her form and bearing full of a stately grace; but he felt thankful to Mrs Weston and her daughters for their opportune arrival.

The talk of the Weston ladies was not such as to deserve minute record. To chronicle small-beer is seldom worth the while. There certainly was 'something' between Lydia Snooks and young Tomkins of the Peninsular and Oriental, who

expected to command the steamer of which he was first-officer. Mrs Snooks was smilingly oracular; but the engagement was considered certain.—The Burtons' children had scarlatina.—Old Colonel Hanchett's gout had caused the grand dinner-party to be put off.—There was the sweetest thing in hats, a duck of a hat, fresh from Paris, it was said, to be seen at Madame Flahaut, the milliner's, in High Street.—Papa was at the Club still, engaged at whist, no doubt. Mr Weston did enjoy a rubber between office-hours and dinner-time; and though the claims of imperious podagra deprived him of Colonel Hanchett's society, no doubt there were contemporaries enough to cut and shuffle and deal those marvellous pieces of painted pasteboard which harsh Methodist preachers of the last century used to designate as the books of Apollyon.

The conversation now turned upon a certain Patent which Bertram was about to take out, to explain which, it should be mentioned that one of his inventions in steam-machinery having met with high praise from Mr Mervyn and the technical judges to whom it had been shown, was about to be legally protected. Good Mrs Weston and her girls were almost as proud and as pleased as if their new friend had been a son of the one and a brother of the other two. That Bertram was a rising man, and one sure of success, had come to be an article of faith in the Weston household; and even gruff, good-natured Mr Weston had acknowledged to his wife that 'the boy was born with a diamond spoon in his mouth, which is better than a gold or silver one; and would rise to the surface, let wltg would try to sink him. It was noticed, too, that the Manager took a pleasure in the talk of his young Assistant, which he did not take in that of the highly respectable and substantial householders with whom he conferred over the card-table and the mahogany. And when Mrs Weston pressed Bertram to stay and dine, she knew that her lord would be pleased to see that bright, thoughtful young face beside the board. Bertram, however, did not accept the invitation to dinner. He had work, he said, to do.

'Work is all very well; but it does not do to make a toil of a pleasure,' said honest Mrs Weston, with a pardonable confusion of ideas. 'You are getting pale and fagged, Mr Oakley.—Yes; you may laugh; but I have had experience of young people, and know that a holiday does good, now and then. Next month, for instance, there is the great Southampton Archery meeting—North and South—and we shall have a sight to show you worth looking at. We are famous bowmen and archeresses here, you know, so near the New Forest; and yet we shall have enough to do, against Nottingham and Cheshire and York, and the rest, to keep the Gold Cup.'

'You will be there, at anyrate, on the 27th?' asked Julia Carrington.

'Yes,' Bertram answered. He certainly meant to be present at that contest with bows and arrows, the rather that by that time his labours with respect to the Patent, which absorbed most of his spare time, would be over. Then he took his leave. Miss Carrington, as they parted, gave him a strange look from under the silken fringe of her eyelids—a long, languishing look, which haunted him afterwards, in spite of himself. He fancied,

too, that there was a sadness in her air and bearing which may not have been wholly feigned; but he went resolutely back to his lodgings, and busied himself with his models and his drawings and his books, and presently forgot, as students can, the enchantress and her wiles. It was deep in the night when he laid his head upon his pillow, at last to sleep the dreamless sleep that waits on toil.

## HOW SOME AUTHORS WORK.

INTELLIGENT people are generally curious about authors and authorship. They long to know how certain ideas originated in the minds of the writers. Was such and such a book composed under the influence of sudden inspiration, or was it the slow product of laborious thought? Was it written off at once without stop or stay, or was it corrected and revised with years of anxious care? There are indeed few things more interesting, though few more difficult, than to trace the growth of a book from its first conception till it develops into full life and vigour. For the growth is different in different minds; and authors are peculiarly chary of lifting the veil, and letting outsiders penetrate behind the scenes.

It is only comparatively recently that we knew to a certainty how the idea of *Adam Bede* began to arise in George Eliot's mind. The usual report was that the Quakeress, Dinah Morris, was literally 'copied' from Elizabeth Evans, George Eliot's aunt, who had been a female preacher at Wirksworth in Derbyshire. But from George Eliot's own account, given in her letter to Miss Sara Hennell, we find what the facts of the case really were. She only saw her aunt for a short time. Elizabeth Evans was then a 'tiny little woman about sixty, with bright, small, dark eyes, and hair that had been black, but was now gray;' of a totally different physical type from Dinah. For a fortnight, Elizabeth Evans left her home and visited her niece in Warwickshire. One sunny afternoon, she happened casually to mention that in her youth she had, with another pious woman, visited an unhappy girl in prison, stayed with her all night, and gone with her to execution. 'This incident,' adds George Eliot, 'lay on my mind for years, as a dead germ apparently, till time had made a *nidus* in which it could fructify. It then turned out to be the germ of *Adam Bede*.' We may take this very remarkable account as a fresh proof of the adaptive faculty of genius. A slight newspaper paragraph; a passing word in ordinary conversation; a sentence in a book; a trifling anecdote, may suggest ideas which will eventually blossom out into volumes of intense interest. That germ is, however, the root of the matter; it is the main-spring on which the whole depends.

Mr James Payn, the novelist, tells us that when he was a very young man, and had very little experience, he was reading on a coach-box an account of some gigantic trees. One of them was described as sound outside; but within, for many feet, a mass of rottenness and decay. 'If a boy should climb up, bird-nesting, into the fork of it, thought I, he might go down feet first, and never be heard of again.' 'Then,' he adds, 'it struck me what an appropriate end it would be for a bad character of a novel. Before I had left

the coach-box, I had thought out *Lost Sir Massingberd*. Such a process lasted for a shorter time with Mr Payn than with the majority of novelists; with many, the little seed might have germinated for years before it brought forth fruit. Yet Mr Payn is remarkable for the clearness and coherency of his plots; they always hang well together, and have a substantial back-bone.

Other writers do not lay so great a stress on plots. Dickens's plots are rambling and discursive in the extreme. They resemble a high-road that winds, now into a green lane, now up a steep hill, and now down to a broad valley, while we are quite unable to tell how we arrived there. His personages are his strong point; it was they who haunted his imagination day and night. He wrote under strong pressure, and with an intense consciousness of the reality of his men and women. For the time being, he lost his own identity in that of the creations of his brain. The first ideas that came to him were at once eagerly seized and committed to paper, without any elaborate circumspection, though he was at infinite subsequent pains to revise and correct both MS. and proof. With regard to Kingsley, we learn from his *Life*, that none of his prose fictions, except *Alton Locke*, was ever copied, his usual habit being to dictate to his wife as he walked up and down his study. Hence, probably, the inequality of his writings. His habit was thoroughly to master his subject, whether book or sermon, generally out in the open air, in his garden on the moor, or by the side of a lonely trout stream, and never to put pen to paper till the ideas were clothed in words. And these, except in the case of poetry, he seldom altered.

Charles Lever was one of those authors who hated the drudgery of copying and revising. He says himself: 'I wrote as I felt, sometimes in good spirits, sometimes in bad, always carelessly, for, God help me! I can do no better. When I sat down to write *O'Malley*, I was as I have ever been, very low with fortune; and the success of a new venture was pretty much as eventful to me as the turn of a right colour at *rouge-et-noir*. At the same time, I had then an amount of spring in my temperament and a power of enjoying life, which I can honestly say I never found surpassed. The world had for me all the interest of an admirable comedy.' Lever had remarkably little of the professional author about him; and his biographer tells us that no panegyric about his last book would have given him as much satisfaction as an acknowledgment of his superiority; at whist!

It constantly happens that authors themselves prefer those of their books which the public fail to appreciate. This was certainly the case with the late Lord Lytton. In one of his letters to Lady Blessington, he says: 'I have always found one is never so successful as when one is least sanguine. I felt in the deepest despondency about *Pompeii* and *Eugene Aram*, and was certain, nay, most presumptuous about *Devereux*, which is the least generally popular of my writings.' In the same way, George Eliot was far more anxious to be known as the author of *The Spanish Gypsy* than of *Adam Bede*. It is quite natural that authors who make composition a study, should pride themselves on those books which have cost them most pains and trouble. But

these books are not always their masterpieces. The comic actor who is full of the idea that his forte is tragedy, suddenly and unexpectedly finds himself hissed.

Hardly any form of composition seems as easy as a good comedy; yet those theatre-goers who smile at the sparkling dialogue of *The School for Scandal*, would hardly believe the amount of thought and labour it cost Sheridan. The characters were altered and recast again and again. Many of the speeches put into the mouths of Sir Peter and Lady Teazle are so shifted and remodelled from what they were in the first rough draft, that hardly a word stands in the same order as it originally did.

Of all literary workers, Balzac was certainly the most extraordinary in his *modus operandi*. At first, he would write his novel in a few pages—hardly more than the plot. These would be sent to the printer, who would return the few columns of print, pasted in the middle of half-a-dozen blank sheets in such a way that there was an immense margin left all round. On this margin, Balzac would begin to work, sketching the personages of the story, interpolating the dialogue, perhaps even completely altering the original design of the book. Horizontal, diagonal, and vertical lines would run everywhere; the paper would be scrawled over with asterisks, crosses, and every kind of mark. The dreams of the unlucky printers must surely have been haunted by those terrible sheets, besprinkled with all the signs of the zodiac, and interspersed with long feelers like the legs of spiders. To decipher such hieroglyphics must indeed have been no enviable task. Four or five times this process was repeated, until at last the few columns had swelled into a book; and the book, in its turn, never went through a fresh edition without being revised by its over-scrupulous creator, 'who sacrificed a considerable portion of his profits by this eccentric plan of building up a book.'

Harriet Martineau at first believed copying to be absolutely necessary. She had read Miss Edgeworth's account of her method of writing—submitting her rough sketch to her father, then copying and altering many times, till no one page of her *Leonora* stood at last as it did at first. But such a tedious process did not suit Miss Martineau's habits of thought, and her haste to appear in print. She found that there was no use copying if she did not alter, and that even if she did alter, she had to change back again; so she adopted Abbott's maxim, 'To know first what you want to say, and then say it in the first words that come to you.'

We have a very different style and a different result in Charlotte Brontë's toil in authorship. She was in the habit of writing her first drafts in a very small square book or folding of paper, from which she copied with extreme care. Samuel Rogers's advice was, 'To write a very little and seldom—to put it by—and read it from time to time, and copy it pretty often, and show it to good judges.' Another contemporary authoress, Mary Russell Mitford, frankly confesses that she was always a most slow and laborious writer. 'The Preface to the Tragedies was written three times over throughout, and many parts of it five or six. Almost every line of *Atherton* has been written three times over, and it is certainly the most cheerful and sunshiny story that was ever

composed in such a state of helpless feebleness and suffering.'

Every author must choose the mode of composition which suits him or her best. With some, copying may be but a needless labour; but to beginners it is almost indispensable; and the work which is not subjected to such careful consideration and revision is not likely to serve more than a temporary purpose. From this may be excepted the work of daily journalists and others whose writings are demanded as fast as they can be penned; but on the part of those who would aspire to do work that seeks a permanent place in the world of literature, much care as well as never-ceasing diligence is required.

## SHALL SHE BE SACRIFICED?

### CHAPTER II.—IS HE MAD?

SEVERAL days passed away, and Miss Colebrooke soon became quite fond of my Aunt. Mrs. Thompson improved; and I rejoiced at this, especially for her young mistress's sake. Twice during the next week the mysterious stranger made his presence known. Once I caught sight of him at one of the upper windows at the back of the house, peeping stealthily behind the blind; and another time, the hall-door having been by accident left ajar, I had walked up-stairs without giving notice of my arrival, when I again saw him suddenly disappear up the stairs. It was in the evening, after the maid had gone home. But still I said nothing to Miss Colebrooke about it. I thought it was not my place to question her, being a comparative stranger; but I felt extremely inclined to do so. That there was some mystery connected with her, was evident enough. What it was, I could only conjecture. It might be that she had made a runaway marriage, abetted by Mrs. Thompson, and which circumstances rendered necessary should be kept secret. I could not bear to think of this; but an incident that occurred a few days later strengthened my suspicion.

My last evening visit had been paid to the patient. It was past eleven; and I was standing at the open window of my bedroom, looking out on the night, which was very starry, but moonless, when I heard voices below in the next garden, and distinguished two dark figures.

'I must take a walk out to-morrow. I tell you, Ida, I shall die moping up in that room all day, and you being obliged to be so much with Mrs. Thompson makes me lonelier than ever. I want exercise.'

'Hush! Don't speak so loudly; you will be heard. Listen to me. For my sake, do remember;' and here her voice sank, so that I did not catch the conclusion of her speech. It was Miss Colebrooke who spoke. They could not see me, though I saw them. I waited for more.

'Yes, yes,' he replied to whatever it was she had said to him. 'I know that, my darling. Have they said anything about having seen me?'

I did not hear her answer. But presently I heard her sob, and he put his arm round her and kissed her, and then drew her gently into the house.

That was all; but it was enough to confirm

my ideas. I cannot describe what I felt. No one could have known her for a fortnight, as I had, without having their peace of mind disturbed. I need not say that I slept very little that night; and I did not wonder at my Aunt telling me at breakfast, next morning, that I was not looking well. Before paying my next visit to the house-keeper, I had made up my mind to tell Miss Colebrooke what I had seen. It would put my suspense at an end to know the truth.

'Miss Colebrooke,' I said to her rather abruptly as she was walking down the hall passage with me, 'you are married, I believe?'

She started, and stared me in the face in complete astonishment, and then burst into a low musical laugh.

I had never heard her laugh before, and I liked to hear it; it gave me a certain hope too. 'Why do you laugh?' I asked. 'Am I not right?'

'How can you think I am married?' she said.

'My thought is wrong, then?'

'Indeed, it is. If I am married, I don't know it myself. But why do you ask, Doctor?'

'Well, I will tell you. If you were to see a man put his arm round a young lady and kiss her affectionately, what would you think?—That they were married, or at anyrate engaged to be married?'

She gave a slight involuntary exclamation, but did not reply.

I repeated my words and looked straight into her eyes. She turned them away, with an uneasy expression on her face.

'The people you saw,' she replied presently, 'need not be husband and wife, or even lovers. They might be brother and sister.'

'Well, yes; so they might be. Have you a brother, Miss Colebrooke?'

'I do not,' she said, drawing up her pretty head with dignity, 'understand why you want to know, or why should you ask me so many questions—especially when'—She stopped.

'Then the gentleman I saw was your brother?'

'You will not mention'—she began.

'You don't think,' I interrupted, 'that I gossip about what I may learn during my visits to patients. You must consider'—

'I did not mean to offend you,' she interposed. 'I was only going to ask you not to mention that you have seen this man.'

'I understand,' I said quietly.

'I cannot tell you now,' she continued, 'who the gentleman is, the sight of whom has naturally roused your curiosity. I may perhaps tell you soon—not that I am bound to do so, but you and Mrs. Stonewell have been so very good and kind, that I should not like you to think unkindly of me.'

I went away with a lighter spirit. I felt happier. I had ascertained at least that she had not passed the gates of wedlock.

The next day I learned from her that the mysterious stranger was her father! Before telling me, she made me solemnly promise not to reveal the information to any one. This extreme caution surprised me very much. Why should she object to it being known that he was her father? I jumped to the conclusion that he had done something wrong, or why was this strict concealment necessary?

She perceived in my face the doubts in my

mind. I frankly avowed them. I asked her why he was hiding himself from the world.

She was so evidently distressed and troubled at my question, that it made me vexed that I had asked it.

'Do not inquire, Doctor. There is a sad reason for it. I will speak to him. He may like to see you, now you have found out his being in the house.'

'I should like to know him. Will you introduce me?'

She paused a moment, pondering. 'Well, I will tell him,' she said, 'so that you promise not to reveal to a single soul his presence in this place.'

'You have my word for it. It is a word that has never been broken.'

Next time I called, she told me that her father had consented to see me, then led the way to his room.

'Papa,' she said, as she opened the door, 'this is Dr Aylmer, who has been so kind to me and to poor Thompson. I have brought him to see you.'

He was sitting at a desk with his head bent over some writing. As soon as he saw me, he rose and bowed. He was a tall, well-formed man, and gentleman-like in appearance. He had strongly marked features, with eager eyes, capable, I thought, of flashing with fiery passion, when he was vexed. His manner with me, at first, was restless and suspicious. He watched me attentively, but after a few minutes he became more at ease. I soon saw he had something on his mind. He did not attend to my remarks, for he continually begged my pardon, and asked me to repeat what I had been saying. He looked unhappy and wretched, except when his daughter spoke to him, and then what a change came across his face! He smiled brightly, and seemed for a moment to forget his trouble.

'I see Ida very seldom now,' he said; 'her time is so fully taken up with Mrs Thompson. I feel very dull when she leaves me. It is a lonely life—shut up here. I don't like it, and yet'—

'But why stay up here, then?' I asked. 'There are many families in Spanners in whose society you would find pleasure.'

'It cannot be, Dr Aylmer. You do not know my unhappy circumstances.'

'That is true.'

'Well then, those circumstances compel me to keep myself away from my fellow-creatures.'

'I am sorry to hear you say so,' I remarked.

'Well, at anyrate I have reason enough in all conscience to be sorry for myself.' He spoke so strangely that I began to fear that his brain was affected. 'Do you know?' he continued, 'but for her!'—pointing to his daughter—'I would wish I were dead—rather, that I had never been born.'

'Oh, dear papa,' remonstrated Ida gently.

'Unhappiness makes you despond,' I remarked.

'Yes, sir; and misery caused by—'

'I had rather not hear it,' I said, 'if it pains you to tell me.'

'It would shock you, Doctor. You and your Aunt have been very kind to my child, and I feel I can safely confide in you; but I will not burden you with a secret, that you might not

think right to conceal, and which would endanger me if it were published.'

His words made me wonder whether his brain was affected by some strange mania, or whether, as I had thought at first, he had committed a crime that was imperilling his liberty. Whatever the dread mystery was, I knew it was a frightful load on his conscience, and that the knowledge of it was saddening the life of his innocent young daughter. Even now as he spoke, the tears rose involuntarily to her eyes. He noticed this.

'Ida, dear child, come to me,' he said tenderly. 'Kiss me, my darling. You are unhappy. Oh, how cruel I am! If I were dead, you would get over my loss, after a time, and be cheerful again, and lead a brighter and a freer life. Shall I lie? Say the word.'

'Papa, dear, what are you saying?' she cried in a distressed voice.

Poor man, I thought, he must surely be insane. I rose to take my leave.

'When shall I have the pleasure of seeing you again?' he asked, as he bowed, refusing for some reason to shake the hand I offered him. 'Tomorrow, will you again favour me? I am so dull, never seeing any one.'

I willingly promised, and left the room feeling wretched at the thought that Ida's father was the victim of some dread form of monomania.

#### CHAPTER III.—AN UNWELCOME VISITOR.

For several days after that, I, at his repeated wish, visited this strange man. I soon found him to be very intelligent, and capable of talking sensibly on most subjects. Sometimes I doubted that the opinion I had formed of him was correct; and yet every now and then some words of his would confirm it. That wild flash too in his eyes which I often observed when he was excited, gave colour to my suspicion.

Of Ida, the more I knew of her, the more she attracted me, and the more I suffered. If there was hereditary madness in the family, might not she also be afflicted some day? To think that such a misfortune could be reserved for that gentle girl, gave me much anxiety. To put an end to this painful suspense, I one day asked her if my conjecture was a right one.

'My father mad! Oh Doctor, what can make you think so?' she asked in astonishment.

I told her that his own occasional remarks had led me to form this belief.

'You are wrong, Dr Aylmer. His words have too true a meaning. It would be dreadful enough if he had been insane, but as it is'—She stopped, as if afraid she had said too much.

I would not pain her by asking her more; but when she gave me her hand and said good-bye, I could not resist pressing it warmly in my own.

At the gate, a man stopped me. 'That house is let, isn't it?'

'It is.'

'For how long, do you know?'

I said I was not certain, which was the fact.

'You know the people, don't you?'

'Yes; I do.'

'And their name?'

'Certainly, if I know them, I know their name.'

'What is their name?'

Not knowing who the person was, and disliking his manner, I waived answering his query. I did not think it right to answer inquiries about my acquaintances from strangers in the streets. I therefore passed on to pay some professional visits, without waiting for him to speak again. I saw that he looked angry, as he moved away in the opposite direction.

When I returned home I observed the man again. He was watching attentively the windows of the house in which my neighbour lived; his hat was very much drawn over his eyes, as if he did not wish to be recognised. The next morning when I was passing through our gate to go next door, I saw him entering their gate. He marched boldly up the steps before me and knocked. The servant answered the door.

'I have come to see your mistress on business.'

'My missus can't see no visitors, and there's illness in the house.'

'Indeed. But she will see me. Please to show me to the sitting-room?'

'I will ask her, sir. What name shall I say?'

'Oh, never mind my name.'

'I will tell her, sir, if you will wait here.'

'Show me to the parlour or drawing-room, then, while you go. You can say, if you like, that I am from the house-agent.' As he said this, I noticed a sinister smile on his face—which was an ill-looking one that made me think he was uttering an untruth. I seemed instinctively to distrust him. I followed him into the house; but he looked displeased as I entered the room, into which he had been conducted.

'You're a friend, and a privileged one, I suppose?' he asked.

'Whose friend?'

'The young lady's.'

'You seem not to have yet ascertained her name,' I observed. 'If you *do* come from the house-agent, I should have thought you would have known it!'

'I do know their name, sir, and perhaps better than you do, though you had the incivility to refuse to answer my question when I politely asked you yesterday.'

'It is no business of mine,' I returned, 'to tell my friends' names to any stranger in the road who may choose to ask me.'

'You are, I suppose, the doctor who lives next door?'

I bowed coldly.

The door opened, and Ida came in.

'Oh, is it you, Doctor? I thought it was'—She stopped suddenly, as the young man standing behind me met her sight. She turned very pale, and looked on him with an expression of disgust, mingled with fear. I cannot call it any other name; it *was* fear. He was, I perceived, an unwelcome visitor. He held out his hand to her; but she refused to touch it. She simply bowed still more coldly than I had done.

'I was beginning to fear some of you were ill,' he said, with a hasty smile, 'seeing that Doctor here. I hope it is not your father?'

I never saw such a look of contempt as that with which she surveyed him.

He moved round and stared at me, which I took as a hint that he wished to be relieved of my presence. Thinking she might not like

speaking openly to him when I was in the room, I proceeded up-stairs to see my patient, who was now progressing favourably, and was on the fair road towards recovery. I did not see Ida again before I left, as she was still with her visitor. I observed the following day that she looked weary and harassed.

'You have been sitting up too late,' I said, taking her hand.

'No, indeed, Doctor. But it is true I have not slept at all since yesterday morning.'

'Mrs Thompson does not require such close watching now,' I continued. 'You should have gone to rest as usual.'

'So I did; but my thoughts kept me awake.'

'Then you must try and not think to-night; that's your Doctor's command, remember, and you must obey it.'

She tried to smile, but with very poor success, and the tears came to her eyes instead. How I longed to be able to comfort her.

'I am afraid,' I said, 'that your visitor yesterday caused you annoyance.'

'Don't speak of him; he is one of the chief causes of our unhappiness. If— But *ifs* are of no use.'

I told her that he had asked me the day before what their name was, and that I had refused to say. I inquired if her father knew he had called; she replied that he did. After a few minutes' conversation, I proceeded to the housekeeper's room. She was so very much better, that I told her she might get up—which she much wished to do—but that she was not to go farther than the next room, as she must avoid the slightest cold for some time to come. When I left Mrs Thompson, Ida asked me if I would go up to her father, as he had expressed a desire to see me. Before going to him, however, she made me promise not to say anything about the gentleman I had seen, as Mr Colebrooke did not like him.

I found him looking more thoughtful and melancholy than usual. I told him so.

'Yes,' he assented. 'Continual anxiety is no preserver of health or spirits.'

'But you should keep your mind calm, and not let your anxiety overcome you.'

'Ah, Doctor, what's done cannot be undone. Sin leads to sorrow, and it may now lead to a worse one than has yet been. The innocent may suffer for the guilty.'

I did not understand him; but I was sure his words had an ominous meaning.

Ida looked at him, and then gave a slight involuntary shiver. He noticed it.

'Ida, my child, you love me, don't you?'

'Dear papa, you know it.'

'You would do a great deal for me?'

'Try me,' she said, quietly and firmly.

'Even sacrifice yourself, my treasure?'

'Yes, I would even sacrifice myself.'

'Rather than see me die of my own choice?'

'Yes, yes; a thousand times.' She spoke emphatically, but with agitation.

'God grant,' I observed, 'that there will never be any need for such a sacrifice.'

'There may be, though,' said Colebrooke in a serious tone. 'Dr Aylmer, I repeat, strange though it may sound, there may be, and soon.'

I glanced at Ida, quite unable to comprehend

this singular speech; but she looked away, apparently shunning my gaze.

'Ida,' continued her father, 'your assertion, then, is deliberate and unalterable!'

'Nothing can change it, papa.'

He smiled, and a gleam of hope, such as I had never seen on it before, lighted up his face. He kissed her tenderly. There was no doubt he was dotingly fond of his daughter, and at this no one could wonder. Who *could* help being fond of such a treasure?

'You hear her,' he said proudly; 'and it is true. I know she would do anything for me.'

'But I do not understand what you mean,' I said. 'In the, I hope, improbable event happening of your life depending on your daughter sacrificing hers, would you not willingly yield yours, rather than accept such an alternative?'

'Her life!' exclaimed he. 'No; you don't understand me. I mean her happiness, her free wishes—not her death. God forbid!'

'That is another matter, Mr Colebrooke. But you would not let her do even that, would you?'

He made no answer. But I observed that a struggle was going on in his mind, the contentions of self-interest and self-love on the one hand, and affection for his child on the other. Such a battle may soon have to be decided. Which force will be victorious?

### THE HOMES OF THE INCAS.

PERHAPS some of the most remarkable of ancient dwelling-places are the ruined homes of the Incas, still scattered about on that great continent which, by a strange misuse of terms, we call the New World. In these vestiges of palaces and large cities, on the worn stones of grand and massive monuments, lies the undeciphered history of that motley empire, in which fragments of surrounding races conquered by the Incas were mixed up in a high degree; for before the waves of the Spanish invasion surged over Peru, there were no pages of history to turn back for a faithful picture of the national life; no possibility of tracing the successive steps which led the Incas from their early seat of civilisation to the shores of the Pacific Ocean.

Tradition says that the first homes of the Incas are to be found on the shores and islands of the sacred lake, Titicaca; and amongst the ruins there, many objects of interest in gold and silver and pottery have been discovered. Some of the few rare specimens of pottery present fair representations of the people of those far-off times, which show that they were identical in feature with their descendants of the present day. But at the period when this race of kings are first met with in history, their empire extended for two thousand five hundred miles, and included the present states of Ecuador, Peru, Bolivia, and part of Chili. It was traversed by the two great mountain-ranges of the Cordilleras. The eastern chain, which forms the true watershed of the South American continent, and which is unbroken even by the passage of rivers, runs parallel with the coast, sometimes a hundred

miles away, sometimes approaching so closely, that its rocky feet are washed by the long billows of the Pacific. At a varying distance rise the majestic snow-clad mountains of the Western Cordilleras, or the Andes proper, all rugged and intersected by deep valleys, through which the rivers, running sometimes a thousand miles due northward, find their way at last. From the vast bosom of the glaciers flow the Aperamae and the Vilcomaya, affluents of the Amazon—that mighty river, which discharges its wealth of waters into the Atlantic Ocean four thousand miles away.

But a great portion of this vast kingdom was practically uninhabitable. On the plateau of the Despoblado, which lies far above the limits of eternal snow, between the mountain-ranges, there is no trace of human habitation, excepting the small huts of refuge built by the Incas on the main road between the northern and southern parts of their dominions. And in the desolate region around the lake Umayo, the only distinguishing feature are the innumerable *chulpas* or burying towers, which stand singly or in groups upon the desert plain. Round or square, these tombs are solid structures, with one small cavity at the base, entered by a narrow hole in the side. Some are in ruins; a few as perfect as when first completed; many, doubtless, as completely vanished as the ashes they were meant to cover.

At the time of the Spanish conquest, the seat of the Inca power was at Cuzco, which is dominated by the stupendous fortress of Sacsalmachan; and a lovely Yucay amongst the woods that clothe the lower spurs of the Cordilleras. Here, in this lofty and semi-tropical valley, surrounded by a coronet of mountains that throw their glittering peaks against the pure blue sky to a height of eighteen thousand feet, the Incas built their palaces, and those far-famed gardens which sweep in curves around the hills, and descend into the narrow valleys. Washed by the rapid waters of a stream which flashes back a winding line of silver far away, each terraced garden was provided with an *acequia* or canal, to receive the overflowing water of the mountain streams when the snow melted. Mr Squiers, late United States Commissioner to Peru, says: 'The system of irrigation of the ancient Peruvians is well worthy of attention. Even in those parts where rain falls during six months in the year, they constructed immense irrigating canals. They not only economised every rood of ground, by building their towns and habitations in places unfit for cultivation, and buried their dead where they would not encumber the arable land; but they terraced the hillsides and mountains to heights of hundreds and thousands of feet, and led the waters of mountain springs and torrents downward until they were lost in the valley below. These *acequias*, as they are now called, were often of considerable size and great length, extending in some instances for hundreds of miles.'

Every pass to this secluded valley, hemmed in

by glaciers, ravines, and precipices, was guarded by an impregnable fortress: on one side rises Ollantaytambo; on the other, looming out grandly against the snowy mass of the Andes on a headland four thousand feet high, stands the irregular oval of Pisac. Each point of access to these strongholds was carefully walled up with stones, or crowned with towers. Not far from the modern city of Truxillo, the vast structure known as the Temple of the Sun covers an area of seven acres. It rises eight hundred feet, as a double rectangle, formed of huge adobes, and incases a central core of earth; beneath which is said to be hidden away an immense treasure called 'the great fish,' belonging to the ancient dynasty. A smaller treasure—the 'little fish'—was secured long ago by a Spaniard, to whom the secret of its hiding-place was revealed by an Indian cacique.

There are extensive ruins at Pachacamac, in the immediate neighbourhood of Peru; but perhaps the most interesting remains of an ancient city are those in the valley of the Rimac, where several miles of the heavy wall which surrounded the town still stand. Built not unlike the ancient Babylon, this curious city consisted of a labyrinthine maze of streets, passages, apartments, and pyramidal structures rising stage by stage, with terraces and broad flights of steps leading to their summits. The houses—generally formed in squares—were divided into an immense number of small apartments, none of which communicated; and only through the low doorways could the light and air gain admittance; these opened on to narrow alleys disposed in straight lines, and were so arranged that no door was opposite another.

Far anterior to the earliest legends of Peru, the shores of the Pacific Ocean were peopled by the Chimu, a race said to have been conquered by the war-like son of the ninth Inca, according to the Catalogue left by Garcilasso de la Vega, which commencing in the eleventh century, reaches to the Spanish invasion. They gave their name to the great city whose immense ruins now extend for many miles along the coast. Who can look without wonder and reverence on the vestiges of this ancient dwelling-place—on the mysterious tombs and temples which are the only record of millions of men who in unknown ages laboured and worshipped here! Of the temple built by the Incas in Chim, only the walls remain; but the Sacred Virgins have left some curious relics amongst the ruins of their convent. Numerous dried-up human bodies, which have been preserved without embalming, were found sitting side by side, swathed up in winding sheets, and tightly corded.

On the same desolate sea-coast there is a vast and lonely space, which bears the name of El Castillo. In its sandy soil lie hundreds of buried skeletons; and the storms of Time in disinterring these remains, show that they are those of men who died a violent death. What battle-field is this overlooking the mighty sea? What manner of men were they who found a grave upon its surf-beaten shores? Within sound of the tides which for centuries have ebbcd and flowed since these dry bones lived, they still remain to tell us that some great hosts did sweep across the plain; but their race, their feuds, their very names are now unknown.

So also of the Incas, that race which has left

such 'footprints on the sands of Time,' there is no record but in the blood-stained chronicles of the Spanish historians. And even in the dark history of the conquest of Peru, one of the saddest episodes in the annals of the world, where a monotony of bloodshed, of fire and sword and plunder, marked the progress of the Spanish arms, but little reliance can be placed on the exaggerated statements of Las Casas and other chroniclers of that period. They found no written language in the conquered land; and it was only dimly and vaguely, through the intermingled myths and legends of the people, that any record of the ancient Inca dynasty could be briefly traced.

## OUR PETS.

### IN THREE PARTS.—PART II.

I MUST now give some account of those pets which were our especial charge and delight, namely, the wild birds which we tamed, and of which we had always a considerable number. In what follows, I merely make a selection of the most interesting of our pets of this description.

The starling, which is one of the commonest of Shetland birds, makes a charming pet. He is easily domesticated, and becomes exceedingly familiar—a brisk, bustling, pert little fellow, with really a great amount of fun in his composition. One starling we had for many years. When not quite able to fly properly, he had been pounced upon by one of the cats; but was rescued, and, soon recovering from the fright, grew to be a beauty and a great favourite with us all. We never attempted to teach him to speak; but his natural powers of mimicry were extraordinary. He imitated the notes or cries of other birds to perfection. When the weather was fine, his cage was slung up out of doors, where he enjoyed immensely the sunshine and fresh air, and had ample opportunities for exercising his peculiar gift. The whistle of the curlew and ringed plover—the plaintive sound of the long-tailed duck—the croak of the raven—the caw of the hooded crow—the wild scream of the scawew—the sharp chatter of the tern, he perfectly reproduced. We had a mountain linnet at the same time, an exceedingly sweet songster. As soon as the latter commenced his morning song, Jack the starling began to fidget about and ruffle up his feathers, and work himself into a state of anger and indignation most amusing to witness. Presently he seemed to come to the conclusion that the linnet was either chaffing or challenging him; and as such a thing was not to be endured by such a very superior bird as himself, he resolved not to be outdone; so, settling himself on his perch, and drawing in his head between his shoulders till he appeared to have no neck at all, he poured forth a song so exactly after the linnet fashion and on the linnet key, that the imitation was pronounced as good as the original. But the exertion seemed to be great and fatiguing, and was seldom sustained for any length of time, and always concluded with a few harsh, loud, and utterly unmusical bars of his own proper pipe, shrieked out in an angry and impatient manner intensely ludicrous, and just as if he meant to say: 'There! Whatever you may think, that's as good as yours any day.' After a few minutes'

rest and a little refreshment of water, he would begin again, and repeat the same performance.

Several times we had amongst our pets a snowy owl. This magnificent and rare bird does not seem now to breed in Shetland, though there is reason to believe it did at one time. Our pets of this species were, therefore, adults which had been slightly wounded, or caught when asleep at the side of a stone on the hill-top. They are certainly the most beautiful and handsome of their kind; but they do not make good pets. They are too powerful and naturally fierce to make it safe to allow them much liberty; and possibly owing to their not having been tamed from the nest, they never got reconciled to confinement and restraint. They always recognised the person who usually fed them, and showed, in a certain uncouth way, that they were not ungrateful for the rabbits, mice, starlings, buntings, and the like fare with which they were liberally supplied; but on the whole, we found them sulky, fierce, and untractable; and they showed very little intelligence, justifying the phrase which describes a man who is dull of apprehension to be as 'stupid as an owl.'

We had a splendid peregrine falcon once, and he had no lack of the brightest intelligence. He was my especial property, and although always gentle and fond of being noticed and caressed by any one, towards me he showed the most devoted attachment and affection. He flew after me whenever I allowed him, and was never so happy as when perched upon my arm or shoulder. I was wont to take him to a fine warren, and he soon got quite adroit at catching rabbits.

Often we had merlins, kestrels, and sparrow-hawks brought us from their nests in some wild and lofty cliff by a noted and obliging cragsman, who was always able and willing to supply us with almost any kind of young birds we might wish for pets. All the hawks we found easy to tame, docile and intelligent; and they were consequently great favourites. But of all our pets amongst the land birds, I select for special notice the hooded crow. He is not a beautiful bird certainly; but he makes up for his not handsome appearance, by his exceeding cleverness. Birds as a general rule do not seem to be endowed with a great sense of humour; but the hooded crow is an exception. He is brimful of fun of a certain description, delighting in nothing so much as practical jokes; and withal he is good-tempered, merry, and cheerful. The sly cock of his head, and twinkle of his keen little eye, it is impossible to misinterpret; he is continually meditating a trick or mischief of some sort. No bird is easier to tame; and he speedily becomes not only confident, but pertly familiar and impudent. We had one in particular for many years. We called him Crabbie because of his sidelong mode of progression when not on wing. His liberty was seldom restricted, unless he had been guilty of some prank more than usually audacious, and then his punishment would be a day or two's confinement, which he greatly hated; but he soon managed to coax us into giving him his freedom, and manifested the utmost gratitude to his liberator. His moral sense was at least as obtuse as a cat's. He delighted in stealing, simply as it seemed for its own sake, not because he could make any use of his plunder. Spoons, needles, wires, pins of thread, balls of worsted, little one's

shoes and socks, anything and everything that was portable to which he could get access, he would carry off, and carefully hide, covering them over with bits of turf; and then wiping his bill, in the most self-satisfied manner hop away as though he had performed a highly meritorious action. Alas for the half-knitted stocking which might be left on a chair or table, if Crabbie was about! The wires would quickly be pulled out and removed, and the stocking torn to tatters. I caught him one day—and an intensely droll figure he cut—hopping out of doors with a pipe in his bill. On another occasion he made off with a piece of tobacco. We never could make out whether he had any intention of himself trying the soothing effects of the weed. He had, or affected to have, a great dislike to bare feet, as the little boys who often came to the house with baskets of sillocks or with messages, had but too good reason to know. On the whole, he was on terms of very good friendship with the dogs and cats; but it always afforded him exquisite delight to tease them, particularly to pinch the point of an outstretched tail, if the owner thereof happened to be asleep; and a pinch of his sharp and powerful bill, whatever pleasure it might afford him to inflict, was no joke to his victim.

Once an old woman was bringing a message to the house. Just as she was crossing a stile, Crabbie's quick eye fell on the spotless cap which adorned the old body's head. It was an opportunity too tempting to be resisted. Down he swooped, neatly plucked off her head-dress, and with a triumphant 'Cra, Cra,' flew away with it. Not being aware there was any such 'uncanny brute' about the house, her consternation may be imagined; and when she appeared at the back door bereft of her white muslin nuch, and told, in tones of horrified agitation, how she had been despoiled of it by a 'cra,' she met with much sympathy from the domestics, who hated Crabbie with a most perfect hatred. And little wonder they hated him, for he teased and tormented them unmercifully, and by his never-ending tricks often imposed upon them a great amount of additional work. For instance, clothes on the bleaching green he seemed to regard as spread out for the special purpose of affording him an opportunity of showing how completely he could soil them. At anyrate, what he did, whenever he got the chance, was to march and hop all over them in the most systematic manner, with the dirtiest effect.

What I am about to relate will appear to many incredible; but having frequently witnessed it, I can vouch for its accuracy in every particular. Our old cook was a most expert dresser of the fine Shetland shawls so well known and so much prized. It is quite an accomplishment to be able to dress these delicate fabrics, and none but a Shetlander can do it properly. The shawl having been washed and slightly starched, is stretched over the bleaching-green, a few inches from the ground, with a multitude of wooden pegs like pencils, and allowed to dry in the sun. Crabbie would sit on some wall at a little distance, intently watching the proceedings of the old cook, who particularly detested him, and with whom he had a standing feud. Then he would fly off, and presently return with the very filthiest and wettest clod he could find, and of set purpose drop it

upon the outstretched shawl, thereby rousing the righteous indignation of poor Meggy, who gave expression to her wrathful and outraged feelings in language much more forcible than choice; all which did not in the least affect Crabbie or disturb his equanimity. In these ways, however, he got to be such a nuisance, that it became necessary on bleaching days, or when a shawl was being dressed, to make sure he was not at large, else the bleaching or dressing was certain to prove labour lost. But then he soon got so exceedingly cunning and adroit in avoiding capture, that it was often impossible to secure and confine him. At last, as we could fall upon no plan of curing him of his thievish and mischievous propensities, we were obliged, most reluctantly, to part with our poor Crabbie, who was sent to a friend in the south.

Sometimes we had ravens amongst our feathered pets, once a piebald of this species from the Farøe Islands, where that variety is not uncommon. The raven, like his congener the hooded crow, is by nature a thief. Indeed, thievish proclivities may be said to be a conspicuous characteristic of the whole genus, as the magpie, jay, rook, jackdaw. No other class of birds, or beasts either, with which I am acquainted shows the same complete obliquity of moral sense. They steal not merely to satisfy the cravings of hunger—that one can understand and even condone—but apparently for the pleasure of the thing. It is clear they can make no use of needles and pins, knives and forks, brushes and combs, rings and other trinkets; but just you let them have the chance, and everything of this sort they will carry off and hide carefully, as a dog hides a bone. It is not with them a case of stealing in order to live, but living in order to steal; and I have no doubt their community always holds in highest esteem, and raises to the highest rank in their republic, the raven that is the most adroit and successful thief.

The raven is as easily tamed as the hooded crow; but he does not make so interesting and amusing a pet, being rather of a sulky and solitary disposition. In his wild state, he is excessively suspicious and wary, and he needs to be, for no mercy is ever shown him. He is a terrible robber of the poultry-yard, destroys great numbers of young lambs, and will never hesitate, if he gets the chance, to attack a weak or sickly pony. The poor ponies, even in the most inclement weather, never know the luxury of a sheltering roof, and during the long winter seldom get any food but the scanty pickings of a barren common, varied with an occasional breakfast of seaweed. Consequently, they become very lean and weak in spring; and after lying down on the cold, damp ground, which they never do in winter, they often get so stiff as to be unable to rise without assistance. They are then said to be 'in lifting.' This is the cruel raven's opportunity. In the cold gray dawn of the morning, he spies his victim making unavailing efforts to rise, swoops down upon him, and with a fierce dab of his powerful bill destroys one eye; a second thrust, and the pony is blinded; and in a few hours his carcass affords a rich repast to his murderer and a score of his kind. No wonder, then, that this 'bird of ill omen' is persecuted and slaughtered without mercy, and that sometimes a price is set upon his head. But in

spite of gun and poison, the wary and sagacious ravens are still all too numerous. They build their nests in the loftiest and most inaccessible precipices, which generally defy the most expert and daring cragsmen to scale, and it is therefore not always easy to get a young raven for a pet; and the universal detestation in which they are held perhaps helps to make them regarded as not particularly desirable ones.

## A CUBAN BALL, AND HOW IT ENDED.

I WAS dreamily reclining in the balcony of my house in Cuba one evening, the half-burnt cigar almost dropping from my fingers, when I became aware, by the barking of Jack, that some one was making his way up-stairs. Turning rather lazily towards the *sala*, and shading my eyes from the strong light within, I waited with true West Indian patience for a glimpse of my visitor. Jack's welcoming bark proclaimed the arrival to be a well-known individual; and I felt relieved; for the mail had been distributed that day, and I was too tired with work to feel in a humour for entertaining any but an intimate friend.

'Hollo! Fred,' I exclaimed, as I caught sight of the figure of a tall, stalwart, young Englishman. 'Is that you?'

Without replying to my unnecessary query, Fred advanced, and throwing himself into a comfortable bamboo chair opposite, said that I was the very man he wanted to see.

'I know why,' I remarked. 'You want to know if I am going to Montero's? What sort of an affair it is going to be? Who are going? And last of all, is *she* going?'

'Of course, that's why I came round here; for I knew that Inez would send you word as soon as it was arranged. Are you going?'

'Well, perhaps I am. But you know that you don't care a rush whether I am going or not, and that your chief, I may say only anxiety is as to whether *she* is going. Let me relieve your anxious mind at once. She is. But it was hard work to persuade her. You know that she was going into retirement to the convent for six weeks: she had forsworn dancing and all the other little social allurements; but Inez managed it all splendidly.'

'Do you know that from Inez herself?'

'Yes; I was there last night.'

'But I thought she was going to no more dances.'

'So I have just told you; and you knew it already, or at least that she *said* she had done with them; but then she had heard that you were not going; and it was not until Inez had vowed that you would be there, that she changed her mind, and agreed to go.—But I say, old fellow, you must look out for yourself; and now I am speaking seriously. You know as well as I do that Juan Morillo is pretty far gone in that quarter. He is a man I don't like; and the fact that Conchita cordially detests him, makes me all the more anxious to put you on your guard. He

is to be there ; so be careful, and keep clear of a row.'

For some weeks past we had known that Don Carlos Montero was going to celebrate the anniversary of his wedding by giving a grand fête at his country estate. Some seven or eight of those interesting seasons had already passed, and there seemed to be no particular reason why this one should be specially honoured ; but the truth was, that his young wife wanted to have a ball ; and he was too fond of company and amusement himself, not to accept the plea of the wedding anniversary as a sufficient excuse for giving his consent.

Don Carlos did nothing by halves. A splendid estate and ample fortune enabled him to gratify desires which in any other country than Cuba would have seemed extravagant whims ; and whether it was a picnic or a ball, those who were fortunate enough to be invited were sure of a hearty welcome and a glorious time. It was not to be the first of the fêtes for which the Quinta Montero was so justly celebrated ; but it was to surpass them all. His relations and most intimate friends from the city and country were to arrive early on the day of the fête, in good time for breakfast ; the guests who were invited for the ball were expected at eight o'clock in the evening.

The momentous day arrived at last ; and never had the Cuban sun shone on a merrier party than that assembled at the station at six in the morning. About a dozen dark-eyed señoritas, chaperoned by three or four mammas—quite enough too, the girls thought—and seven or eight gentlemen, married and single, nearly filled the long railway carriage, open from end to end, which was specially engaged to take us to our destination. How pleasant the ride was in the early morning air, as we rushed through cane-fields, cocoa-nut groves, and plantain-walks ! Station after station was passed, and field after field, where the cane was being cut down and gathered by the scantily attired slaves ; and at last, about eight o'clock, we arrived at the little station of Colmillos. This was our stopping-place ; and here we found *quitrines*—the Cuban country carriages—and horses for the gentlemen, waiting to carry us to the *quinta* (country-house).

A smart ride of half an hour brought us to the long avenue of Indian laurel trees which led up to the house ; and in a few moments more we had dismounted, and were assisting the ladies to alight.

I need say nothing about our welcome ; it was a truly Cuban one ; and only those who know the Cubans, can understand how sincerely demonstrative it was. But I must say something about the place where we expected to pass two nights at least. It was a square two-storied house, built of the coral stone of which the island is composed, a broad veranda running round the two sides and front. A flight of wide steps led from the veranda to the broad carriage-sweep, the centre of which

was tastefully laid out into plots luxuriant with shrubs and flowers. Opening on to the veranda in front was the *sala* or hall, the principal room in a Cuban house. This was a large and lofty apartment, about sixty by thirty-five feet, having at one extremity a cabinet, where the elders could play chess or cards while watching the dancers, and at the other the principal bedroom. Immediately at the rear of the *sala* was the dining-room, a long wide corridor, opening on to a veranda or gallery at the back, where the two side-wings of the house and the outhouses at the far end formed the *patio* or court-yard. At one end of the dining-room, a winding staircase led to the upper bedrooms, the balconies of which commanded a view of almost the entire estate.

As we drew up in front of the house, we scarcely recognised the old acquaintance whose hospitable roof had so often sheltered us before. The veranda pillars were already clothed by nature with heavy wreaths of honeysuckle ; but all the rest of the front of the house was decorated by a mass of rich green dotted with flowers. From the roof hung festoons of laurel leaves and choice flowers ; while hundreds of Chinese lanterns in verandas and gardens were to illuminate the whole at night. On the open space in front of the garden, and outside the gate, curious-looking objects mounted on posts told us that a grand display of fireworks was to form part of the evening's programme.

About a dozen young negroes were busily engaged opening cocoa-nuts, whose cool delicious water was to refresh us after our long and dusty ride. Presently the ladies came down, looking fresher and brighter than in the early morning ; and soon the welcome sound of a gong told us that breakfast was on the table. And what a breakfast ! This over, we lit our cigars, and followed the ladies to the veranda, where we found rocking-chairs and hammocks in plenty. But Cuban ladies are passionately fond of dancing at all times and seasons, and we had not been long enjoying our *doles far niente* ease, before some of them had persuaded the band, which had come with us by rail in the morning, to take up their instruments in exchange for the knife and fork. So there was no help for it ; and in spite of the warnings of our host against tiring ourselves out before evening, we were soon slowly moving over the marble floor of the *sala* in the Cuban dance.

The *danza* is peculiar to all Spanish-American countries, and is admirably adapted for hot climates. It is a simple slow three-step movement, the feet scarcely rising from the floor ; and it is one of the best dances in the world for carrying on either a conversation or a flirtation with your partner. At regular intervals, the music dashes off into quick time, the dancing stops, and the ladies of each four couples which happen to be nearest to each other form a chain and back to their partners. By the time this has been done, the music strikes off into the original measure, and the dance is resumed. The music is so peculiar, that a foreigner must become accustomed to it before he learns to understand and appreciate its strange weird symphony.

After this, a lady and gentleman danced the

*zapateo*, a favourite dance of the country-people. The two performers stand opposite to each other, the gentleman with his hands clasped behind his back, and the lady holding up her dress in front just high enough to display the feet and ankles, of whose symmetrical smallness Cuban ladies are pardonably vain; then, to the accompaniment of an air that is too musical to be called jerky, they begin with a slow side-to-side movement, the feet stamping the floor, as, advancing and retiring, they move round each other, the lady coquettishly inviting her companion to approach her; and then, as he obeys, suddenly turning from him with a wicked gleam of mischief in her sparkling black eyes, which seem to say: 'Follow me if you dare!' Quicker and quicker speed the dancers, constantly varying the figures; until at last, after a quarter of an hour's dancing--no slight exertion in a tropical climate--they give place to another couple. Tired at last, we went for our well-earned sangaree, cigars, and siesta, and so put off the day.

As evening drew on we were obliged to exchange our cool white drill suits for something staidier and heavier; for alas, even in a country ball, unless it happens to be a *guajiro* or peasant-ball, where the concourse is a mixture of country-folk and town swells in peasant dress, black coats at least are *de rigueur*. They would not have been allowed in Don Carlos' house, however, where every one did and dressed as he pleased, had it not been that the Governor of the district had accepted an invitation; so, while wishing the Governor at Jericho, we were obliged to submit.

When, after dressing, we descended to the *sala*, we found that the guests were already arriving in numbers. The presence of the ladies was marked by quite a cloud of muslins and tarlatans and other light stuffs, of a bewildering variety of colour, surmounted by the black lace mantillas, that fell in graceful folds from the head far down the back. The civilians among the gentlemen were in black broadcloth coats, white vests and trousers, and patent leather boots; and this uniformity was pleasantly broken by the presence of a goodly number of officers in full dress, many of them covered with decorations.

Fred and I were standing together near one end of the *sala*, and Conchita, who had come out from town with our party in the morning, was standing with Inez not very far from us, when I saw a gentleman, on whose arm a rather elderly lady was leaning, dart a swift glance, and give a distant bow as he recognised us. It was Juan Morillo. I looked mechanically towards Conchita, and saw that she was visibly agitated, for the same eyes had met hers. I repeated in English my previous caution to Fred; and then recognising some old friends, who entered at that moment, left him.

Precisely at eight o'clock, the hour at which dancing was to commence, the orchestra, which was placed out on the piazza, began the Imperial Quadrilles, always the first dance at a Cuban ball. By some fatality, I saw that Morillo and Fred were *vis-à-vis* in the set next to ours; and I knew that Conchita had promised to dance that quadrille with her Englishman. I was so absorbed in looking at them, that I was only recalled to myself by my partner tapping me with her fan as she asked me if I were asleep. I saw no more of them for

some time. Indeed I was so thoroughly enjoying myself, that the excitement and my reliance on Fred's prudence made me forget him and Conchita entirely. There were strolls on the piazza and through the less crowded garden-paths, sparkling with Chinese lanterns, and through shrubberies enlivened by myriads of fire-flies; ices and lemonades were in request, and had to be brought; and scarcely had the duties and pleasures of one dance been concluded, when another began.

At eleven o'clock we were to have supper; but it was nearly half-past that hour before two hundred, or about one half of the guests, sat down in the immense dining corridor. The other half, of which we, Don Carlos' most intimate friends, formed part, were to wait until the first had finished; and long enough it seemed, for we were both tired and hungry. We danced, flirted, and strolled; but at length our turn came; and great was our surprise when the gong again sounded, to find the same table as though it had not been used at all. How Don Carlos managed it, I know not; but a fresh relay of viands had been placed on the table, as it were in the twinkling of an eye. Not one of the numerous dishes broken into, not a spot of the table-cloth, not a particle of cork on the table or floor. It was as though he had had an army of genii in his service. Small wonder that the first two hundred took so long when we saw what was set before us. It was pleasant to be in that second table, and to know that no hungry crowd was waiting impatiently to succeed us; so we took our time. When at last we rose, the signal was given for the display of fireworks to commence. At any time, they would have been beautiful; but on this night they were more than beautiful, and could I have stationed myself in the crown of one of the tall palm-trees and looked down on the spectacle, I might have imagined that I was gazing on a scene out of the *Arabian Nights*. The brilliant dresses of the ladies, strangely lit up by the many-coloured blaze of light from the house in the background, the black and white costumes of the gentlemen, the gay uniforms of the military, and the lights from the cigars, made a fairy scene under that starlit Cuban sky which I shall never forget.

'*Bravo! Bravissimo!*' how magnificent!' was the cry when the finest work of the artist was at length displayed. The applause had scarcely died away, when suddenly, far above the hissing and explosions of the fireworks, were heard two reports of a pistol and the loud shriek of a woman. The shots came from a shrubbery on the right of the house; and in an instant a score of the party were on the spot.

Bending over poor Fred, who was to all appearance dead, we found Conchita. 'He has gone, there! there!' she cried, pointing in the direction of the nearest cane-field; and at once a number of the gentlemen started off in pursuit. We carried my poor friend into the house, where after some time the doctors, of whom several were at the ball, gave us the gratifying intelligence that he was still alive. Later on, he was able to tell us how it had occurred. High words had passed between him and Morillo, who wanted him to fight without delay. Fred refused to have anything to say to him that night at least, and they parted. When the fireworks began, Fred

and Conchita, no doubt taking more interest in each other than in pyrotechnics, wandered off when they knew that they would not be missed. It was then that Morillo confronted them, and again challenged Fred to fight there and then. He again refused; and the refusal had no sooner passed his lips, than Morillo raised his pistol, and firing first at Fred, and then at Conchita, fled through the shrubbery. At the moment, Fred felt nothing, but almost immediately became unconscious. Conchita had escaped unhurt. Fred's wound, though dangerous, might not prove fatal. He had a strong constitution, and on that the doctors pinned their faith in his recovery.

Of course the ball was brought to a sudden termination; and there were now none in the house but the guests from town. Three hours after the event, the pursuers returned, no trace of the fugitive having been found. Fred recovered in time; and six months afterwards, I saw him and Conchita on board the steamer leaving for Europe, where they were going to spend their honeymoon.

Two years passed away, and during that time nothing was heard of Juan Morillo, although no doubt ever existed in our minds that he had joined the insurrection. Time showed the correctness of our suspicions. I was in Santiago de Cuba, when one day the Spanish cruiser *Tornado* came into the magnificent bay towing the steamer *Virginus*, which had been captured after a long exciting chase. The news soon spread through the town that a large number of insurgents, arms and ammunition, were on board; and sincerely we pitied the poor unfortunates whose fate was only too certain. In the evening, we knew that a number of them had been condemned and, in accordance with Spanish custom, had been placed in the 'chapel' (*capilla*) where, strongly guarded, and attended by priests, they were to pass their last night on earth engaged in devotions. At eight o'clock next morning, they were to be shot; and from my balcony I saw the sad procession pass on its way to the place of execution. The foremost of the prisoners was the captain of the captured steamer. Above six feet in height, of a noble, commanding presence, which was strengthened by his long flowing gray beard, he walked to his death with an air of quiet dignity, which was strangely in contrast with the demeanour of many of his companions. I do not mean that there was any flinching in them. Brave and defiant to the last, the condemned Cubans seemed to glory in the prospect of their approaching fate. It could be nothing worse than death, that they were sure of; and again and again their cries of '*Viva Cuba libre!*' rose on the still morning air. Several of them belonged to some of the best Cuban families; one of them I knew, who, as he passed a house near mine, threw his hat up to some ladies who were weeping on the balcony.

With a start, my eyes fell on a prisoner in one of the last files. It was Juan Morillo! I pitied him then, and wished I could make him understand it; but he passed without looking towards me. A quarter of an hour afterwards, the hush of silence which everywhere prevailed was broken by the first sharp volley which sent six souls into eternity. The firing went on until all had paid the penalty.

We have often spoken of our ball and its tragic ending; and when Morillo's name is mentioned, none speak more feelingly of his sad end than Fred and Conchita.

#### THE RAIN-TREE.

Some travellers in South America, in traversing an arid and desolate tract of country, were struck (says *Land and Water*) with a strange contrast. On one side there was a barren desert, on the other a rich and luxuriant vegetation. The French consul at Loreto, Mexico, says that this remarkable contrast is due to the presence of the *Tumai caspi*, or the rain-tree. This tree grows to the height of sixty feet, with a diameter of three feet at its base, and possesses the power of strongly attracting, absorbing, and condensing the humidity of the atmosphere. Water is always to be seen dripping from its trunk in such quantity as to convert the surrounding soil into a veritable marsh. It is in summer especially, when the rivers are nearly dried up, that the tree is most active. If this admirable quality of the rain-tree were utilised in the arid regions near the equator, the people there, living in misery on account of the unproductive soil, would derive great advantages from its introduction, as well as the people of more favoured countries where the climate is dry and droughts frequent.

#### NIGHTFALL.

LIE still, O heart!

Crush out thy vainness and unreach'd desires.

Mark how the sunset-fires,

Which kindled all the west with red and gold,

Are slumbering 'neath the amethystine glow

Of the receding day, whose tale is told.

Stay, stay thy questionings; what would'st thou know,

O anxious heart?

Soft is the air;

And not a leaflet rustles to the ground

To break the calm around.

Creep, little wakeful heart, into thy nest;

The world is full of flowers even yet.

Close fast thy dewy eyes, and be at rest.

Pour out thy plaints at day, if thou must fret;

Day is for care.

Now, turn to Go!

Night is too beautiful for us to cling

To selfish sorrowing.

O memory! the grass is ever green

Above thy grave; but we have brighter things

Than thou hast ever claimed or known, I ween.

Day is for tears. At night, the soul hath wings

To leave the sod.

The thought of night,

That comes to us like breath of primrose-time,

That comes like the sweet rhyme

Of a pure thought expressed, lulls all our fears,

And stirs the angel that is in us—night,

Which is a sermon to the soul that hears.

Hush! for the heavens with starlets are alight.

Thank God for night!

HARRIET KENDALL.

## ANECDOTES OF BIBLES.

IN view of the recent publication of a revised translation of the New Testament, it may not prove uninteresting to glance at the many curious vicissitudes which have befallen the early translations and editions of the Bible; for the early editions of the Book, which should always have commanded the most anxious solicitude, were not even favoured with the care and attention now bestowed on a halfpenny newspaper. In the early days of printing, the necessity of carefully revising the printers' work could not have been realised, for it seems to have been a difficult matter to get a book through the press, particularly a large book like the Bible, without a great number of *errata*. Small books even, were not so exempt from blunders as we might suppose. A thin octavo volume of one hundred and seventy-two pages, entitled *The Anatomy of the Mass*, was published in 1561, which was followed by fifteen pages of *errata*! The pious monk who wrote it informs his readers in the Preface to the *Errata* that the blunders in his little book were caused by the machinations of Satan!

During the Commonwealth, and even a short time before Charles I.'s execution, the printers, in order to meet the great demand which then existed, sent out Bibles from their presses as quickly as they could, regardless of errors and omissions. One of the Harleian Manuscripts relates that the learned Archbishop Usher while on his way to preach at Paul's Cross—a wooden pulpit adjoining the Cathedral of St Paul's, in which the most eminent divines were appointed to preach every Sunday morning—went into a bookseller's shop and inquired for a Bible of the London edition. He was horrified to discover that the text from which he was to preach was omitted! This formed the first complaint to the king of the careless manner in which Bibles were printed; and as one of the results, the printing of them was created a monopoly. A great competition then arose between the king's printers of London and those of the University of Cam-

bridge. The privilege of printing Bibles was at a later date conceded to one William Bentley; but he was opposed by Hills and Field; and many paper alterations took place between them. The Pearl Bible, of Field, printed in 1653, is perhaps the most blundering Bible ever issued. A manuscript in the British Museum affirms that one of these Bibles swarmed with six thousand faults. In Garrard's Letter to the Earl of Strathord, it is said: 'Sterne, a solid scholar, was the first who summed up the three thousand and six hundred faults that were in our printed Bibles of London.' The name Pearl given to this book by collectors, and a copy of which is to be found in the British Museum, is derived from the printers' name for a diminutive kind of type. It must not be supposed that those many 'faults' were all printers' errors only, for it is well known that Field was an unscrupulous forger. He is said to have been paid fifteen hundred pounds by the Independents to corrupt a text in Acts vi. 3 by substituting a 'ye' for a 'we,' to sanction the right of the people to appoint their own pastors. Two *errata* may also be mentioned. In Romans vi. 13, 'righteousness' was printed for 'unrighteousness'; and at First Corinthians vi. 9, a 'not' was omitted, so that the text read—'The unrighteous shall inherit the kingdom of God.'

Before and during the Civil War, a large number of Bibles were printed in Holland in the English language, and imported to this country. As this violated the rights of the 'king's printers,' twelve thousand of those duodecimo Dutch Bibles were seized and destroyed. A large impression of the same smuggled Bibles was burned by order of the Assembly of Divines for errors such as the following—the words in brackets being those in the Authorised Version: Genesis xxxvi. 24, 'This is that ass [Anah] that found the rulers [mules] in the wilderness;' Luke xxi. 28, 'Look up, lift up your hands [heads]; for your condemnation [redemption] draweth nigh.' It may be added, in the case of the passage from Genesis, that the correctors, as well as the corrected, were wrong. Anah neither found 'rulers' nor 'mules' in the

wilderness, but simply 'warm springs,' as our future Bibles will have it. The Vulgate, or Latin Bible, notwithstanding its other faults, has the passage correct: 'Iste est Ana qui invenit *aquas calidas* in solitudine.' (This is Anah who found warm springs in the desert.)

Anthony Bonnemere printed a Bible in French at Paris in 1538, in the reign of Francis I. He says in his preface that this Bible was originally printed at the request of His Most Christian Majesty Charles VIII. in 1495, and that the French translator 'has added nothing but the genuine truths, according to the express terms of the Latin Bible, nor omitted anything but what was improper to be translated.' Yet the following is interwoven with the thirty-second chapter of Exodus at the twentieth verse: 'The ashes of the golden calf which Moses caused to be burnt, and mixed with the water that was drunk by the Israelites, stuck to the beards of such as had fallen down before it; by which they appeared with gilt beards, as a peculiar mark to distinguish those which had worshipped the calf.' Another interpolation of a similar nature was also made in the same chapter: 'Upon Aaron's refusing to make gods for the Israelites, they spat upon him with so much fury and violence that they quite suffocated him.' We may also note the fact that the three thousand men stated, in the twenty-eighth verse of Exodus xxxii. of the Authorised Version, to have been slain, is increased by the Mohammedan commentators of the Koran to seventy thousand; and in the Latin Bible known as the Vulgate, the number is stated to be twenty-three thousand.

The Vulgate of Pope Sixtus V. comes near to, if it does not equal, Field's Pearl Bible in the multiplicity of its errors. This pope, who ascended the Chair in 1585, was resolved to have a correct and carefully printed Bible. He specially revised and corrected every sheet; and on its publication, prefixed to the first edition a Bull excommunicating all printers who in reprinting should make any alteration in the text. Yet the book so swarmed with blunders, that a number of scraps had to be printed for the purpose of being pasted over the erroneous passages, giving the true text. The heretics of course exulted in this flagrant proof of papal infallibility! A copy of this 'Scrap Book' was sold some time since for sixty guineas.

There are several 'Treacle Bibles' known to book-collectors. The edition of May 1541 of Cranmer's Bible, at Jeremiah viii. 22, asks: 'Is there no *tryacle* at Gilead? Is there no phisycyon there?' There also appeared a 'Rosin' Bible in which that word was substituted for treacle; and a 'Bug' Bible, because that unpleasant insect was said by the printers to be the 'terror by night' mentioned in the fifth verse of Psalm xci. The 'Vinegar' Bible, printed at the Clarendon Press, Oxford, in 1717, is so called from the twentieth chapter of Luke's Gospel being said to

contain 'The Parable of the Vinegar' (instead of 'vineyard') in the summary of contents at the head of the chapter. It was looked upon as a good joke in the times of political corruption when Matthew (v. 9) was made to say, 'Blessed are the *place-makers*.' The 'Breeches' Bible, printed at Geneva in 1560, said at Genesis iii. 7, that Adam and Eve 'made themselves *breeches*.' This version is as old as Wycliffe's time, and appears in his Bible. Some curious changes in the uses of words have taken place even since the date of the Authorised Version. For instance the word 'prevent,' which in the seventeenth century meant, and ought still to mean, 'to anticipate.' It is derived from the Latin *prævenire*, 'to come before,' and in the Authorised Version never means 'to hinder.' Shakespeare uses 'prevent' for 'anticipate' in *Julius Cæsar*, v. 1.; and Burns in his *Cottar's Saturday Night*. A printer's error in the Authorised Version which has been allowed to remain, may be noted in this place: the letter *s* has been prefixed without authority to the word 'needez' in Second Kings iv. 35. It is printed correctly (neesings) in the only other place where it occurs, at Job xli. 18. 'Neeze' is also to be found in *A Midsummer Night's Dream*, ii. 1.

In 1616, some revision and correction was attempted with partial success; but the two Cambridge Bibles of 1629 and 1638 were the first which were printed with tolerable correctness. The edition of 1638 is said to have been revised at the king's command by several learned men of Cambridge, such as Dr Ward, Dr Goad, and others. Buck and Daniel, the University printers, were so confident of its correctness, that they challenged all Cambridge by a bill affixed to the door of St Mary's Church, in which they offered a copy of their Bible to any scholar who would find a literal fault in it. The first person who publicly noticed any of its errata was Dr William Wotton, who in a sermon preached at Newport-Pagnell, Bucks, noticed an error ('ye' for 'we') at Acts vi. 3. An edition printed at Oxford in 1711 is remarkable for a mistake at Isaiah lvii. 12, where a 'not' is omitted. And the Oxford Bible of 1792 declared that Philip (instead of Peter) would deny Christ before cock-crow.

Great difficulty was experienced by the early translators with the enumeration of the articles composing Jacob's present to Joseph (Genesis xliii. 11), as little was known at that time of the botany of the Holy Land. Tyndale was not far wrong in his version of the Pentateuch in 1530, although 'a curte-sye hawlmie,' &c., looks quaint nowadays. The Geneva of 1560 and the Douay of 1609 had 'rosen' where we now have 'balm.' Dr Geddes introduces 'laudanum' among the presents; but in his manuscripts in the Bodleian Library, Wycliffe translates the first on the list as 'a lytle of precious liquor of sibote,' and adds slyly in the margin that this 'precious liquor' is 'ginne.' A printer's widow in Germany thought

to secure the supremacy of her sex by secretly altering the last clause of the sixteenth verse of the third chapter of Genesis. By substituting the letters 'Na' for the first half of the word Herr (lord or master) it made the word read 'Narri;' the altered text reading, 'And he shall be thy fool.' It is said this attempt at 'improving' the text cost the good woman her life. The translation of St Paul's Epistles in the Ethiopic language was full of errors, which the editors good-naturedly excused by the following plea: 'They who printed the work could not read, and we could not print; they helped us, and we helped them, as the blind helps the blind.' Dr John Jortin, in his *Remarks on Ecclesiastical History* (1754), notices a Gothic Bishop who translated the Scriptures into the language of the Goths, omitting the Book of Kings, lest the was recorded there should increase their inclination for fighting.

Dr Alexander Geddes already referred to, resolved to undertake a new translation; and in 1780, as a preliminary, he published a sketch of his plan under the title of an *Idea of a New Version of the Holy Bible for the Use of the English Catholics*. In 1786, he published another *Prospectus*; in 1787, *An Appendix to the Prospectus*, containing 'queries, doubts, and difficulties relative to a vernacular version of the Holy Scriptures.' In 1788 and following years, he issued *Proposals for Printing*, and several *Answers* to the advice he had received. After all these preliminary flourishes, in 1792 the first volume appeared of a translation which was never completed. Christians of every description rejected it; and the Catholics, for whose benefit it was intended, were forbidden to read it. Yet another *Address* in defence the following year, and the project ends. In what he has translated, Geddes introduces us to Hebrew 'constables,' and the Passover is rather humorously translated 'the Skipover.'

From those blundered editions let us now go back to the first complete printed Bible—that by John Fust or Faust, printed at Mayence, in Germany, in 1455. This magnificent work was executed with cut-metal types on six hundred and thirty-seven leaves, some of the copies on fine paper, and others on vellum; and is sometimes known as the 'Mazarin Bible,' a copy having been unexpectedly found in Cardinal Mazarin's library at Paris. It is also called the 'Forty-two Line Bible,' because each full column contains that number of lines; and lastly, as Gutenberg's Bible, because John Gutenberg was associated with Fust and Schöffer in its issue. It was printed in Latin; and the letters were such an exact imitation of the work of an amanuensis, that the copies were passed off by Fust, when he visited Paris, as manuscript, the discovery of the art of printing being kept a profound secret. Fust sold a copy to the king of France for seven hundred crowns, and another to the Archbishop of Paris for four hundred crowns; although he appears to have charged less noble customers as low as sixty crowns. The low price and a uniformity of the lettering of these Bibles, caused universal astonishment. The capital letters in red ink were said to be printed with his blood; and as he could immediately produce new copies *ad libitum*, he was adjudged in league with Satan. Fust was apprehended, and was forced to

reveal the newly discovered art of printing, to save himself from the flames. This is supposed to be the origin of the tradition of the 'devil and Dr Faustus,' dramatised by Christopher Marlowe and others.

One of the highest prices—if not the highest—realised by any book was for a copy of this splendid Bible, at the sale of the 'Perkins Library' at Hamworth Park, on 6th June 1873. A copy on vellum was sold for three thousand four hundred pounds; another on paper for two thousand six hundred and ninety pounds. This large price is rather surprising; for there are about twenty copies in different libraries, half of them belonging to private persons, in Britain. Before this sale, the most expensive book was Boccaccio's *Decamerone*, printed at Venice in 1471, which was bought at the Duke of Roxburghe's sale in 1811 by the Marquis of Blandford (Duke of Marlborough), for two thousand two hundred and sixty pounds; although its value fell afterwards to nine hundred and eighteen pounds in 1819, when Lord Spencer became its purchaser.

When Dr Castell was engaged in the preparation of his Polyglot Bible, he was much patronised by Cromwell, who allowed the paper to be imported free of duty. It was published during the Protectorate, and dedicated to Cromwell in a respectful preface. At the Restoration (1660), Cromwell's name was omitted, and the Republican strains of the preface toned down. The different editions are known as 'Republican' and 'Royal' among book-collectors. At that time, there was a mania for dedicating books to somebody—a celebrity, if possible.

Before types were invented, printing pictures from engraved wooden blocks was accomplished in the fourteenth century. Books were made of engravings of the most remarkable incidents in the books of Moses, the Gospels, and Apocalypse; they were called *Biblia Pauperum*, or Poor Men's Bibles. Fair copies of these have brought two hundred and fifty pounds; and the very worst, rarely less than fifty pounds. The rare edition of the *Biblia Germanica*, published in 1487, contains many coloured wood-cuts remarkable for the singularity of their designs; for instance, Bathsheba is represented washing her feet in a tub, and Elijah as ascending to heaven in a four-wheeled wagon! The Bishops' Bible—so called from the fact that most of the translators were bishops—was published in 1568. It contained a portrait of the Earl of Leicester, the great and powerful favourite of Elizabeth, placed before the Book of Joshua; whilst another portrait, that of Sir William Cecil—also a favourite of the queen—adorned the Psalms. In the edition of 1574, a map of the Holy Land, and the Arms of Archbishop Parker, the chief translator, were substituted.

We will conclude with the following anecdotes of Prayer Books. The Clarendon Press, Oxford, printed in 1813 an edition in which occurs twice in the Litany, 'O Lamb of God, which takest away the sins of the Lord.' A copy is still in use, we believe, in Cashel Cathedral. Dr Cotton says he has seen a Prayer Book in which a prayer concluded thus, 'Through the unrighteousness of our Lord Jesus Christ.'

Our last story is from an American newspaper of 1776. A printer in England who printed the

Book of Common Prayer, unluckily omitted the letter *c* in the word 'changed' in the following sentence, 'We shall all be changed in the twinkling of an eye.' A clergyman not so attentive to his duties as he should have been, read it to his congregation as it was printed, thus, 'We shall all be *hanged* in the twinkling of an eye.'

### THE FORTUNES OF BERTRAM OAKLEY.

#### CHAPTER XXXV.—UNCLE WALTER AGAIN.

THERE came the day, earlier than he had expected, perhaps, but not very soon, when Bertram's business at the Yard was completed early by the signature of certain cheques and the indorsement of certain vouchers; and then there was nothing to do that exacted an Assistant Manager's attendance. Mr Weston was in London. The shipwrights, Long Tom and his muscular colleagues, knew their work. The clerks plied the pen, yawning at intervals, and intermitting their clerky tasks to skim over leading articles in the *Daily Something*, or to chat about cricket and the Glee Club. Bertram had time to pay his promised visit to Shirley Villa. It was a pretty, white, bay-windowed house, the Villa, one of many villas and ornamental cottages on the edge of the breezy Common; bordering on which, old oaks yet grew; and giant holly-trees, the boast of that southern shire, showed their dark-glistening greenery and winter wealth of scarlet berries almost as profusely as when the Red King, with an arrow in his heart, lay dead in the Royal Forest hard by. Peat-fires were burning yet, with sullen crimson glow, on many a cottage hearth for miles around; and some of the quaintest customs and most mediæval traditions that our island knows held fast to the tenacious root which they had taken, but a little way, so far as mileage goes, from that Southampton which has for years been the British gateway of the golden East.

Bertram found a kindly welcome at Shirley Villa. As a friend of the Westons, as a friend of Rose Denham, whose story was perfectly well known to her employers, he was very well received. Mr. and Mrs. Denshire were pleasant-natured people. Theodore Denshire had been a barrister, and indeed, was probably a barrister still; but he had doffed the terrors of the wig he had so seldom worn in open court; nor indeed need the most nervous of witnesses have been much alarmed, in a *vis prius* trial, at cross-examination from such a counsel as he had been. Partly from weak health, partly because he had inherited the small property of a childless elder brother, he had turned his back upon the Temple, and lived a quiet life, driving about to picturesque spots, and photographing gnarled trees and thatched roofs for miles around. Mrs. Denshire was no mean member of the Archery Society, a kindly matron, with strong wrists, shrewd black eyes, and a ringing laugh. Alice and Hugh were the children; and then there was Rose. Governesses, I hope, are often as happy as was good Dr. Denham's youngest daughter under the roof of her pupils' parents. She had to earn her bread, and that she cheerfully did, but nobody made it bitter to her by tyranny or insolence. The only clouds that darkened Rose's young life were that Louisa was

far away; and that the man who dogged her steps, the nameless persistent suitor, or persecutor, who plied her with threat and promise, never long allowed her to forget him.

The first greetings over, Mr. Denshire trotted out all his inoffensive hobbies for exhibition to the stranger. Here were his photographs—scraps of still-life in the Forest, the ruined chapelry at Capel, the Hollow Oak of Rufus, the grass-grown roofs and wooden church spire of Toadhurst, the Gipsies' Dell, the huts of Nomansland, where basket-makers and tinkers lived by a precarious industry that was reported to be supplemented by poaching and purloining of timber. These were the bits of decorative wood-carving, a triptych after—a long way after—Albert Dürer; an entablature of nymphs and Grecian warriors, copied from a stone frieze of the ruined gateway of some Morean town, crumbling under the combined effects of weather, negligence, and the Turkish cannon that breached it two centuries ago. And this was Mr. Denshire's law-watering machine, his own invention, really his own; and which seemed to Bertram's unprejudiced judgment an ingenious if cumbrous contrivance for squirting as much water as possible into the face and over the garments of the operator, and projecting a minimum of the same wholesome element, with the maximum of pumping, over the greensward.

Bertram was invited to stay for luncheon; and that meal, synchronic with the children's dinner, being despatched, he took leave of his entertainers, and accompanied Rose Denham and her two pupils in their daily walk, across the Common itself, where the golden gorse was in its summer luxuriance of yellow flower; and then into the leafy Avenue, where the great elms stood towering in their majesty, like so many castles, the strongholds of the birds, that twittered or carolled securely on twig and bough, high above the reach or the aim of man or boy.

At the end of the Avenue, Bertram bade Rose good-bye. He had himself a visit of ceremony to pay to some potent magnate of that P. and O. Company whose passenger steamships first metamorphosed Southampton from the clean, bright city, beloved of aristocratic old maids, into the wealthy seaport that it is now. Great men and men of note in the commercial world had begun now, moved by some instinct which enabled them to scent success, as swine and spaniels in the New Forest scent buried truffles, afar off, to be polite to Bertram Oakley. Bertram had been bidden to a heavy dinner, with heavy company, at the house of this gentleman, and had been grandly patronised, and solemnly lionised, as the clever youngster from Mervyn's, of whom Mr. Mervyn thought so well, and as the inventor of the new double oscillating steam-something of which newspaper writers—who knew nothing about it—spoke in terms of such glib approval. Rose was silent, Rose was shy. She busied herself a good deal with the children. At luncheon, which was dinner, whenever Bertram spoke, he had had no listener so faithful as this slender, golden-haired girl. But out of doors she was not talkative, and at last they two shook hands and parted.

Bertram, as he walked on townwards, was not so much vexed, after a minute's thoughtfulness,

with the change in Rose's manner as many a young man, in his place, would have been. Somehow, he felt, rather than knew, that the alteration boded him no harm—that she did not like him the less, because she had grown to be so silent and bashful and shy—so unsisterly, as he would once have said, with him. No man could have been less inclined to plume himself on his knowledge of women—and indeed those whom women like the best, know the least of them—than Bertram Oakley; but Rose's behaviour did not exactly displease him. A perfectly frank bearing, the indications of a mind fancy-free, are perhaps the most disheartening symptoms of any that are written down in Love's Medical Guide.

Half-way down the broad white High Street, in front of that ancient *Dolphin Hotel* before which hundreds of carriages, gorgeous with coronets, or rich with emblazoned heraldry that would have dazzled foreign eyes, were wont to draw up, in the old coaching and posting days, Bertram suddenly caught sight of a face not to be easily forgotten. A gentleman was giving instructions to his Italian valet, a brown, white-toothed, black-whiskered Neapolitan, as to the luggage which two town porters were stowing away, in leisurely fashion, on a green hand-truck. Uncle Walter himself, as gay, light hearted, and brisk as ever, like an elderly butterfly that had successfully for many years flourished in decorous indolence. Bertram hesitated. But Mr Walter Denham's eyes were nearly as good as his; and the *ricchioso* waved his kidded hand, and beckoned, blithely, across the street, so that the young man was, as it were, compelled to go over and speak to his old acquaintance.

'How d'ye do?' was Uncle Walter's half-caressing, half-indifferent greeting. 'I knew you were here, for I saw your name in the *Times*. A new steam-engine, hey?'

'A slight improvement only—if it be an improvement, which practice must prove,' answered Bertram, as he took the well-gloved hand. It needs a very churlish temper, or a very stern resolve, to make any of us refuse a hand offered to our grasp.

'And I wanted you to be a painter's model—you were quite handsome enough—at seven-and-six, when required,' said Uncle Walter, amused at the reminiscence. 'Right, lad, right! to use the inside of your head, instead of the exterior.—And so you live here, now?' And the artistic amateur surveyed the broad, white, rather empty High Street, as if with renewed interest, on account of his young friend.

'Yes; I live here, sir; and so does your niece—your brother's daughter—Miss Rose Denham. I left her but half an hour since,' said Bertram steadily.

'Does she, really?' asked Uncle Walter, in his pretty, playful way, as if he had been a masculine Peri, poised on starry wings, and condescending to take a little concern in the ways and fates of mankind.—'Luigi, tell the clumsy curs to be careful with that box.' This last sentence was couched in fluent Italian, and prudently; for clumsy curs, if of our island breed, are sometimes apt to snarl and turn.

'Si, si, Eccellenza,' answered the brown man from Naples, displaying his sharkish teeth; and Bertram himself was fain to smile.

'You understood me?' said Uncle Walter rapidly. 'I forgot your knack of picking up languages—sharp-witted lad that you are!—Niece Rose lives here, then? I didn't know it. Where is she, and is she as pretty as ever? Sometimes, those blondes go off, in looks, early.'

'Miss Rose Denham is very pretty. She is governess, now, to the young children of Mr and Mrs Denshire, at Shirley Common, three miles from the town,' answered Bertram.

'How very nice of her—and how very nice of them!' chimed in Uncle Walter airily. 'I'm sure she has chosen for the best; and that good, sensible Louisa—with whom, I fear, I am no favourite—has also chosen for the best.—Are they ever going to bring that carriage, Luigi?—in procuring for her such congenial employment. A governess! Well! well! Governesses, except in a novel, are never bullied, I believe; and the constant contact with fresh young minds—Steady, blockheads, with the luggage—must be ineffably sweet. Dear Louisa, she is, perhaps, pardonably prejudiced. We should always be patient.—Luigi, hurry the scoundrels with that carriage!'

'You are going abroad, sir?' asked Bertram, who scarcely knew what tone to assume when confronted by this light, gay nature, that seemed so successfully to repudiate the responsibilities which conscience and custom impose.

'Yes; I am going to Spain, to Granada,' replied Uncle Walter, with a sigh of satisfaction as the laggard vehicle at last rolled out of the hotel yard. 'The *Victoria*, which is to take me to Gib, sails, or rather steams, to-day. Something wrong with the Alhambra—a landslip, they call it, which has caused, I fear, irreparable damage to the dear old place, on which I wish to feast my loving eyes again before it becomes an absolute heap of ruins, or, worse still, gets restored beyond recognition.—Ta! ta!' added the worthy gentleman, as he stepped into his open carriage, and waved his hand in token of adieu. 'My love to my niece!'

Off went the carriage at a brisk pace; and Bertram, after watching it until it got beyond the range of vision, walked slowly and sorrowfully away.

## HAIL AND HAILSTORMS.

To us, living in our temperate climate, the destructive power of the hailstorms of other regions almost exceeds belief. The hailstones which we see occasionally fall during a thunderstorm are not worthy to be named beside the enormous masses of ice, sometimes many pounds in weight, which frequently demolish the crops in Southern France and other countries. While our much-abused climate may have—and undoubtedly has—its drawbacks, it also has its advantages; for whether it is worse to have a bad season from the beginning, with the consequent failure of the crops, or a promising harvest, all but ready for the reaper, cut down and ruined by one dire hailstorm of perhaps not more than a few minutes' duration?

The most remarkable hailstorm on record is that which occurred in France on the 13th of July 1788. It was divided into two distinct bands—the western one four hundred and twenty miles long and ten miles broad; and the eastern one five hundred miles long and only five miles broad.

There was a mean interval of twelve miles between them, in which space rain fell. The storm moved at the rate of thirty-two miles per hour, the hail falling for not more than seven or eight minutes at the same place. The western branch began at Touraine, near Loches, at half-past six A.M., passed over Chartres, Rambouillet, Pontoise, Clermont, Douai, entered Belgium, and passed over Courtrai, and finally died out beyond Flushing at half-past one P.M. The eastern branch began at Orleans at half-past seven A.M., passed over Arthenay and Andouville, reached the Faubourg St-Antoine in Paris at half-past eight, Cressy-en-Valois at half-past nine, Cateau-Cambresis at eleven, and Utrecht at half-past two P.M. Though the hail fell for such a short time at each place, the destruction of property was immense. No less than ten hundred and thirty-nine communes in France suffered, the damage being found to amount to about a million pounds sterling. Some of the hailstones weighed more than half a pound. There are several very remarkable features in this hailstorm: its extraordinary length, its comparatively narrow width, and its short continuance at one place. These peculiarities might be conveniently accounted for by supposing an immense cloud or body of clouds carried along by a steady current of wind, and discharging as it moved in its course. But how can we conceive a single cloud bearing along in its bosom nearly twenty-eight million tons of ice?—which was about the quantity, estimating it at one pound per square foot, that fell to the earth during the storm.

Another storm of exceptional severity was that experienced in the neighbourhood of Angoulême on August 3, 1813. It began at six P.M., having been preceded by profound darkness. The hailstones, which were very large, wounded several persons severely, and killed a child near Barbezieux; injured the cattle, sheep, and pigs; entirely stripped the trees of their leaves; cut the vines into pieces, and crushed the crops. The next day, the landscape had the appearance of mid-winter, the hail having accumulated in the hollows and roads to a depth of almost three feet. The whole neighbourhood was deprived of game; and the effects of the storm were visible five years afterwards, the vines in particular not having recovered their productive powers.

The annals of meteorology afford many examples of storms almost as severe as those mentioned above. One which burst over the department of the Aisne, on the 7th of May 1865, caused damages amounting to several million francs. In the Valley of the Scheldt the hailstones lay fifteen feet deep upon the ground, and were still visible five days after. On the 9th of May in the same year, the hail which fell upon the Catelet meadows, in the arrondissement of St Quentin, formed a crystal mass a mile and a quarter long and two thousand feet broad—estimated to amount altogether to twenty-one million cubic feet.

Although hailstorms in this country are comparatively rare, we cannot boast of exemption from them. They never assume the desolation-spreading character, however, so common in France. One that occurred in 1809 broke two hundred thousand panes of glass in London alone. In 1824, the crops were almost completely destroyed in Hertfordshire, Middlesex, and Essex; the damage done upon a space of three thousand

four hundred and eighty-seven acres in the last-mentioned county alone being estimated at fourteen thousand five hundred and seventy-four pounds, or about four pounds three shillings and sevenpence per acre on an average. In 1843, during the months of July and August, severe storms were experienced in Cambridgeshire, Berkshire, Norfolk, Suffolk, Essex, Hertfordshire, Kent, Oxfordshire, Bedfordshire, Gloucestershire and Yorkshire, some farmers suffering an individual loss amounting to upwards of two thousand pounds. By the storm of August 1, 1846, gardeners alone sustained a loss estimated at fifteen thousand pounds; and more recently that of August 2, 1879, in the neighbourhood of Richmond, inflicted damage in broken glass alone, estimated at thirty thousand pounds. Melancholy though this category of disasters is, it is a pleasing picture when contrasted with the French record of similar calamities, which would well-nigh fill a volume.

Hailstones vary greatly in size. In ordinary storms, they weigh from forty-six to one hundred and twenty grains. It may be interesting to notice some of the largest on record. Holmshed (who is, however, a persistent wonder-monger) says that hailstones as large as eggs fell in England in the year 1202, during the reign of John; and that in the twentieth year of that good King Alexander III. of Scotland (1269) there arose 'great winds, with storms of such immeasurable hailstones, that many towns were thrown down' by their violence, and fires spread throughout the kingdom 'burning up steeples with such force of fire that the bells were in divers places melted.' Those of the Abbey of Aberbrothock (Arbroath) were thus destroyed. In 1323, while Edward III. was marching near Chartres in France, his army was so much injured by a storm of immense hailstones, that he concluded peace. Count de Mezeray relates that when Louis XII. of France made war against the Pope, and carried his army into Italy (1510), bluish hailstones descended during a thunderstorm, which weighed about one hundred pounds! On June 21, 1545, there fell in Lancashire 'hailstones as big as men's fists, which had diverse prints in them, some like gun-holes.' On the 7th of June 1573, in Northamptonshire, some were found which measured six inches in circumference; and on the 29th of April 1697, a storm passed over Cheshire and Lancashire, during which hailstones, weighing eight ounces and measuring nine inches in circumference, fell. Hertfordshire, on the 4th of May in the same year, was visited by a shower of hail, which killed several persons. The stones were fourteen inches in circumference. M. Parent relates that hailstones as big as a man's fist, and weighing from nine and a half to twelve and three quarter ounces, fell in Le Perche on May 15, 1703. Passing over many recorded, and perhaps doubtful, instances such as the above, we learn that during a hailstorm at Constantinople on October 5, 1831, there fell stones weighing more than one pound. Similar ones are said to have been picked up in May 1821, at Palestrina (Italy). Blocks of ice fell at Cazorta in Spain on June 5, 1829, which weighed four and a half pounds; and in the south of France, during the latter part of October 1844, some fell which weighed eleven pounds. After a hailstorm on May 8, 1802, in Hungary, a piece of ice was found which

measured more than three feet both in length and in width, with a thickness of two and a quarter feet. To conclude this list, a hailstone is said to have fallen in the reign of Tippoo Saib which was the size of an elephant! It is possible that many of those so-called gigantic hailstones were simply masses of ice composed of a collection of hailstones agglomerated together in some hollow space into which they had fallen, and where they may have remained for some time after the general fall of hailstones had melted and disappeared.

With regard to the composition of hailstones, it would seem that they have but one feature in common—they are all formed of congealed water. They differ in size, in shape, and in structure. Some are nearly round, some oval, some pear-shaped. Some are white and opaque, others are clear as crystal. Kämtz considered the pyramid to be the primitive form of the hailstone; while, on the other hand, Descartes, Elie de Beaumont, Airy, Delcros, and Nöggerath, believed it to be the sphere broken in its fall. Professor Osborne Reynolds has lately advanced the opinion that it is a sort of spherical pyramid, dense at the base, and soft towards the apex. A good example of this form of hailstone was noticed on May 22, 1870, in Paris by M. Trécul. It was pyriform, and about three quarters of an inch long by half an inch wide. The third part of it, at the top—the narrowest portion of the hailstone—was opaque and white; while the lower or the broadest part was perfectly translucent, like the purest ice. When looked at from the broadest end, it presented the shape of an obtuse-angled rhombus, and from the sides there started oblique facets, which converged and died away towards the obtuse summit. Captain Delcros picked up some very remarkable hailstones on July 4, 1819, which fell during a nocturnal hailstorm in Western France. They were nearly spherical, and in the centre was visible a spherical nucleus of a somewhat opaque, whitish hue, which showed traces of concentric layers. Around this nucleus was an envelope of compact bluish ice, with radial lines running from the centre to the circumference. This in turn was surrounded by a coating of concentric layers, upon the surface of which were twelve large crystalline pyramids of clear ice, with smaller pyramids intercalated between them. The whole formed a spherical mass nearly three and a half inches in diameter. Hailstones with a surrounding crust of transparent ice-crystals fell during a violent storm in the Thraileth Mountains, near Bjeloi Klintsch, a short distance south of the Caucasus, on June 9, 1869, and were carefully sketched by Mr H. Alach, a Russian gentleman residing on the spot. Their structure was in many respects similar to that of the ones described by Delcros. M. Parent remarked some at Montargis on July 29, 1871, which were from one to two inches in length, oval in shape, and transparent as crystal. These hailstones are of special interest, as it is the only case on record in which they showed no traces of a central nucleus of soft snowy material. Descriptions might be multiplied indefinitely.—Each observer has had some anomalous feature to record. Many have hoped in a dissected hailstone to read its mysterious history; but as they exhibit such diversity of form and structure, we may be prepared to hear different

causes and processes assigned to almost every hailstorm that occurs.

The indications of a hailstorm are sufficiently well marked. The barometer sinks very low; and, what is unusual before any other atmospheric disturbance, the thermometric column suffers a corresponding depression. Previous to a storm that occurred in the Orkney Islands in the year 1818, the barometer descended 1.15 inches, and the thermometer has been known to sink through seventy-seven degrees Fahrenheit. The clouds usually assume a peculiar aspect. They show here and there immense irregular protuberances, and, judging from the profound darkness which they produce, are very thick. Arago pointed out that they seem to be distinguishable from other storm-clouds by their ashen hue. Nevertheless, hail has been observed to fall from an almost cloudless sky, with the sun shining brightly, and unaccompanied by any tempest or atmospheric disturbance. A sound likened by some to the galloping of a flock of sheep over hard rocky ground, and by others to the noise of a heavy luggage train, a cavalry squadron at full gallop, or the pouring of shot from one vessel into another, is said to be the precursor of a violent hailstorm. It is long since this phenomenon was first observed. Aristotle and Lucretius, among ancient writers, mention it; Kalm noticed it on the 30th of April 1744, at Moscow; Tessier, on the 13th of July 1768, in France; and Peltier heard it in the department of La Somme. A sound was also heard at Auxerre on the 29th of July 1871, previous to the cloudless hailstorm above mentioned. It has been explained by the striking together of the hailstones aloft, as they are whirled about by the wind.

An annual loss of about two millions sterling has not been suffered without many attempts being made to prevent, or, at least, to mitigate the evil of hailstorms. Electricity has always been regarded as the principal agent in their production, and hence it has been proposed to tap the clouds and run off that dangerous element by means of lightning-conductors, or something of that kind. This idea appears first to have been suggested by Guenaut de Montbeillard in 1776. In 1820, La Postolle, and subsequently Thollard, invented a peculiar instrument consisting of straw ropes, in which a metallic wire was interwoven, suspended by means of pointed rods similar to lightning-conductors. These, together with Arago's *paragrêles*, which were captive balloons armed with an iron point and held to the earth by a cord with a copper wire running through it, have all proved unavailing; and the attempt to subdue Nature in this respect, has been abandoned in despair until we shall know something more about her strange ways.

## SHALL SHE BE SACRIFICED?

### CHAPTER IV.—COLEBROOKE'S SECRET REVEALED.

ON the following Monday I went to pay some long promised visits in London, and did not return for a week. My first call on my arrival was to our neighbours. Mrs Thompson was now well enough to resume her usual duties, and the temporary servant had been sent away. Ida looked careworn and weary. How I wished I

could mitigate her unhappiness! She, so young and interesting, to be rendered miserable through no fault of her own.

'Dear Miss Colebrooke,' I said, taking her hand gently, 'I know you have been fretting. You are in trouble. Are you sure I cannot help you?'

'You are very kind to offer to help,' she replied, smiling sadly; 'but no one, I am sorry to say, no one can help me.'

'Is it so bad as that? Is it a new trouble?'

'A new trouble that will soon come,' she replied, in a tone so despairing, that my heart ached to hear her.

'I wish I could take it away,' I said earnestly.

She raised her eyes to mine for a moment, and then a deep blush came over her sweet face. My look had expressed more than my words had.

'Dear Ida,' I continued, 'if I cannot relieve your sorrow, at least let me share it;' and then I told her all my love. As I spoke, a gleam of joy shone for a moment in her face. It seemed as if the return of happiness was not so very distant. The instant after, it was gone; but not before it had told me what I longed to know.

'Dear Dr Aylmer, you do not know. What you ask may not be. It can never be. I—I am engaged to be married to—to'—

If I had touched a powerful electric battery, the shock her words gave me could not have been greater. I had not thought of her having any lover, and I felt sure she cared for me. Presently, I asked her if she loved the man to whom she was engaged.

'I must try hard,' she replied, 'to do so—if I do not now. We must all do hard things sometimes.'

'Not like him!' I exclaimed. 'And yet you are engaged to marry him.'

'Do not judge me harshly,' she said almost pleadingly. 'You do not understand what compels me to'—

'To sacrifice your life,' I concluded. 'Ah, I know now what your father meant when he asked you the other day what you would do for him. But in what way your marrying against your own wishes can benefit him, I am unable to understand.'

'Shall I tell you?'

'Yes.'

'It might save his life.'

'Save his life?'

'Yes.'

'How?'

'Well, it is right you should have the reason. He has several times said he would not mind your knowing. I trust to your friendship for me not to divulge a terrible secret. Do not stop me. I would rather tell you now. My poor father had the dreadful misfortune to deprive a fellow-creature of his life. You have heard of what is termed the Hickards murder?'

I nodded affirmatively.

'The only witness to the act was Mr Purse—

Hickards' fellow-partner—the man you saw here some days since, and who at one time was an acquaintance of ours in London. With a view to turning the miserable business to his own advantage, he has sworn to my father that he will aid him in quitting the country, even at his own risk, *if I consent to marry him*. If I do not consent, then he will give my father into custody and positively swear he saw him *murder* the man! I have, of course, no alternative, and the wedding is fixed for next Monday.'

This was already Thursday.

'Next Monday?' I cried in a tone of pain. 'Oh Ida, your father cannot allow this.'

'Don't blame him. He has not urged me in the least. I have told him that I *will* do it. I am quite determined. Why, I should be my own father's murderer, if I refused this man.'

'As it is,' I said, 'you will murder your own peace, and mine.'

'In spite of what I have told you, Doctor, would you still choose to marry me, the daughter of'—

'What does it signify to me whose daughter you are, as long as you are my own darling Ida?' I said this in a voice of passionate tenderness. I do not remember now all that passed. I know I entreated her to reconsider her decision. I used every argument to persuade her. I promised to aid her father to escape. But all was of no avail. She wept bitterly; but she remained firm.

To escape would be a matter of great difficulty. Mr Purse had taken lodgings in the house right opposite, and watched all their movements. He had threatened that if Ida did not meet him at the church at half-past ten on Monday, he would go directly to the police station and have her father arrested. At one time, they had tried to leave the country, and had even taken passages in a steamer on the point of departure from Liverpool to New York; but just as they were going on board, they had observed Mr Purse, though, as it turned out, he had not noticed them. And as he was coming to the ship to see some friends off, they had hastily returned to land before he had, as they believed, discovered their presence. They had then thought it better to conceal themselves in the country for a time until vigilant search should have abated. They were now living by means of money to the amount of about a thousand pounds, the profits of some articles of value which they had sold. They had not placed this sum in the bank, as if they had, there would have been danger of their whereabouts becoming known.

But how had Purse discovered their hiding-place? It was quite by chance. The house in which they now lived had, as already stated, stood long empty, and the proprietor was desirous to dispose of it. With this view he wrote to his solicitor in London to put the property in the market; and the solicitor, it so chanced, employed for this work the very firm of property agents with which Mr Purse was connected. It was not, however, Purse who first went to Spanners to look at the property, but another representative of the firm; and he, calling at the house to ask about the property, spoke with the housekeeper Mrs Thompson, whom, however, he had not before seen; but he was not allowed into the house. On

his return, in reporting to Mr Purse regarding the property, he commented upon the fact of his not having been admitted into the house; which awakened the curiosity of Purse, who put some questions as to the housekeeper's appearance, and such-like. The result of these inquiries was that Mr Purse's suspicions were aroused, and he himself set off at once for Spanners. But Mrs Thompson by this time being ill, he failed to see her as he had hoped. He made inquiries, however, as to the occupants of the house in question, and learned that a young lady named Colebrooke, with her servant, had taken it; that she called nowhere, went out but seldom, and had excited curiosity. He resolved to watch the house, and for this purpose engaged lodgings opposite. Was Mr Colebrooke with them or not? This he could not ascertain, and he forbore to ask any one. One day, however, he espied Ida as she bade me good-bye at the door; and when I came to the gate, as already narrated, he stopped me, doubtless hoping to ascertain whether the gentleman lived in the house.

And what was the cause that led to the dreadful crime? It was the old story of human anger uncontrolled. Mr Colebrooke—whose real name was Wayne, but who had assumed a false name for obvious reasons—had been made the dupe of a wicked schemer of the name of Hickards, by whom he had been induced to part with his money to purchase shares in a lead-mine speculation. The mines proved to be myths; but the gold he had collected from Mr Colebrooke and others who had trusted him, went to enrich Mr Hickards, who, as already stated, was Purse's partner. An action was instituted against Hickards; but the fraud, though few doubted it, could not be established against him with evidence sufficient for conviction. Hickards had carried out the swindle too ingeniously, and rendered detection impossible. He was acquitted; and Mr Colebrooke, a ruined man, unable to obtain redress, happened to be in town one day on some business, when he had occasion to call at his enemy's office. Mr Hickards was in; and unfortunately some almost unavoidable references to what had already taken place between them, so enraged the two men, that open violence was the result. Hickards had lifted a knife that lay on the table; but this Mr Colebrooke wrested from him, and in the affray that ensued, the weapon pierced the breast of the wretched swindler. He died instantly. His partner, Mr Purse, who at that moment entered from an adjoining room, rushed forward to seize Mr Colebrooke; but the latter managed to elude him, and made his escape.

Mr Purse, 'reading lest suspicion might perhaps be directed against himself, reported to the police that Mr Colebrooke had done the deed. A warrant for his apprehension was obtained; but Mr Colebrooke had fled, disguised, with his daughter and the housekeeper, and as yet had baffled discovery. The all-important fact remains to be told that Purse, who had formerly been a trusted acquaintance of the man he afterwards, with his partner, helped to ruin, was a rejected lover of Ida's; his affection for her being the redeeming point in his character. He determined, as soon as he discovered their hiding-place, to make use of his power, and by promising to aid Colebrooke in escaping from the country,

induce Ida to marry him. How he succeeded in getting her consent, has already been told.

I left the house, a dead weight of misery on my mind. I hardly know how I passed the next twenty-four hours. The anguish of them I shall never forget.

#### CHAPTER V.—AT THE ALTAR.

The next day I called on Mr Colebrooke. I told him 'that I had proposed to his daughter, and that the reason she had refused me was because she had promised to marry Mr Purse to save her father being arrested on a charge of murder.

'You love Ida!' he exclaimed. 'You have offered her marriage; and she has never told me. I thought there was no one that she particularly cared for. It will make it the worse for her, my poor, poor child!'

'And you, sir, have consented to sacrifice her?'

'Doctor, has she told you the dreadful reason?'

'She has. I grieve extremely for her, for you both; but if you promise to free her from this man, I will help you to escape'—

'Oh, impossible, impossible!' he interrupted. 'That man'—and his face became clouded with a look of fierce hate—'is lynx-eyed. Till Monday, he has told me, he shall watch night and day from his window opposite, and take care I shall not escape him. He will do it—I know him—though he passes the whole time without sleep.'

'But you can come over your back-garden palings,' I persisted. 'You can pass out through my gate at night. He will think you are me, and that your daughter is my Aunt. Oh, I am sure we can manage it.'

'Ah, Doctor, there will be no such good luck. If he did not discover the trick at the time, it would not be long before he did so. He would telegraph to every station, and I should be a hunted man again. Don't you know a price of three hundred pounds is on my head?'

I did all I could to prevail on him to listen to my schemes; but he was obstinate. I became angry with him at last, and told him I did not believe he really loved Ida, as he would not even make a final effort to save her.

He looked at me. He not love his only child! What was I thinking? Did I not know what misery it was to him to give her up? She had insisted on it. To lose her father would be a double sorrow to her. She had said so, and he believed her. He knew she would rather a hundred times marry that scoundrel than let her father suffer death.

I told him how terribly the dread of her coming fate was distressing her. She would never know happiness again. Her misery would only end with her life. I said a great deal more. I told him bluntly that I believed he loved himself more than he did his daughter. I expected him to be angry with me; I thought he would have been offended at my rudeness. But no; I remarked that he only compressed his lips tightly, and in his eyes I saw a set purpose, a wild determination. What it was, good or evil, I knew soon.

'Then you won't let me assist you?' I said on leaving. 'You will allow Miss Colebrooke to suffer still more for your sin?'

'Go!' he uttered hoarsely. 'Leave me! I have nothing more to say.'

I left, feeling disgusted with him. In my deep sorrow and despair, I could find no excuse and feel no pity for his own great grief at having to accept the offered sacrifice.

Monday came, only too soon. It was a beautiful day; but its sunshine seemed to mock me. Ida, my beautiful noble Ida, how I felt for her; how I felt for myself. Oh, why must she, so true and good, suffer for another's crime? Why should she be the innocent victim to save a guilty life? To see her again for the last time, to look once more on her before she was lost to me for ever, came to me as an irresistible desire. I would go to the church. She should not see me. I would sit in the gallery, and school myself to bear the sight. I must steel my aching heart to submit patiently and suffer silently. I would go, even though I knew the scene would only increase my pain. I should watch her until she was indissolubly united to the man she abhorred; and then—ah, then.

At ten o'clock I went to the church. It was not very full, as the coming marriage had not been made known. I seated myself in a quiet corner where I could see all, without being seen. Purse came in smiling complacently, and soon after Ida entered with Mrs Thompson. The former was dressed in black—fit emblem of her mourning soul. She was deadly pale and trembled visibly; but she kept up bravely, though I knew the ordeal she was undergoing was worse than death. The clergyman was punctual to the minute, and the service began. Mr Purse was asked the first question in the marriage service, and answered clearly and loudly. The same question was then put to Ida. Her answer seemed to die on her lips. She just managed to whisper it. I thought she would have fainted; but she had a work to do—it was begun, it must be completed.

'Who giveth this woman to be married to this man?' inquired the reverend gentleman.

Mrs Thompson came forward and replied. The clergyman handed the ring to the bridegroom; but at the same moment there was a bustle in the church—a murmur of voices—and in another second Mr Colebrooke rushed hurriedly and breathlessly to the altar.

'Stop!' he cried. 'I forbid this marriage. She shall not marry him.'

The clergyman stared at him in blank amazement. Mr Colebrooke's objection was demanded.

'I declare,' he replied with deliberate distinctness, 'that this is my reason. My daughter only consented to marry that man to save my life. I give myself up to justice. My daughter wished to save me; I am here to save her.'

I felt my heart throb wildly. I cannot describe the strange relief I experienced. I could almost have cried out in my thankfulness. She cast upon him a look of deep tenderness, blended with pitying sorrow. Purse trembled with rage. Revenge was in his eye. I turned away from the sight of the wretch; my soul loathed him.

'Is this statement correct?' asked the clergyman of Ida.

She did not speak; she only hid her face in her hands in an agony of emotion. Her father took her gently by the hand and led her into the vestry, followed by Mrs Thompson and the clergy-

man. I joined them there. Colebrooke seemed pleased to see me.

'I have done it,' he said; 'I am not such an unfeeling parent as you thought me. I shall die, and you and my child will be happy when I'm gone.'

'O father, father,' she sobbed despairingly. 'Don't, don't speak so.'

There were tears of pity in the minister's eyes; my own were moist. Such a scene as that would affect the hardest nature. Two policemen, who had been sent for by Purse, now entered the vestry to arrest Colebrooke. Ida clung to him convulsively. He tried to soothe her, and kissed her with passionate affection. I knew now how I had wronged the man. His devotion to his child had conquered his fear of death. I felt an admiration for him. The sense of right had gained the day.

'Come and see me in prison, my darling,' he said, as he was being led off, accompanied by Purse; 'and you too,' he added, turning to me.

I promised willingly. The next minute he was gone, leaving Ida in speechless grief. I ordered a cab for her, and took her home. My dear aunt stayed with her the whole day, a ministering angel of comfort.

Two months passed away, and the trial took place. At one time the evidence seemed conclusive of the guilt of Mr Colebrooke—that the deed was intentional and designed, not the result of a momentary passion, or accident. His known enmity to the dead man was certainly a strong fact against him; while the evidence of the man Purse seemed to make the links of circumstantial proof complete and deadly. But when Ida was placed in the witness-box, and told the story of Purse's villainy, a change came over the jury; more especially when the prisoner's counsel pointed out how Purse had used his knowledge to coerce the daughter and father into a compact as distasteful to them as it was, on Purse's part, opposed to the laws of the country. Purse had indeed been guilty of an endeavour, for personal and selfish ends, to compound a felony, and this was itself a crime. The speech was successful. The jury returned a verdict that the prisoner had not been guilty of murder; and no alternative charge of manslaughter having been made—the prosecutor having relied upon Purse's evidence as sufficient to prove the capital charge—the prisoner was thereupon acquitted.

Purse must soon thereafter have left the district, as we never saw or heard of him again.

But Mr Colebrooke did not long survive the shock which he had sustained, and in a few weeks we stood by the bed where he lay dying. He took his daughter's hand.

'I give my child to you,' he said, as he placed it in mine. 'She is the only legacy I have to leave, but you will have a priceless treasure in her. I am certain she will prove to you as true and affectionate a wife, as she has been a true and affectionate daughter to me.'

For many weeks after that, Ida was very ill. We thought we should have lost her also, but God mercifully spared her to me. I left Spanners, and came to London, where I have since obtained a considerable practice, and where we were quietly married.

My darling is looking over me now, as I write,

and I kiss the white hand that rests on my shoulder.

Ah, who in the world has a wife more fondly loving, more dearly beloved?

## OUR PETS.

### IN THREE PARTS.—PART III.

AMONGST our feathered pets, we always had a number of sea-birds; indeed, the larger proportion of them were of this class. The beautiful and graceful Herring-gull is the commonest of the gulls in Shetland, and does not migrate to other climes after the breeding season, as do so many of his congeners, the Lesser black-backed gull, the Kittiwake, the Great skua, and the Arctic skua. One of this species we had for many years. No restraint was put upon her movements. She came and went at her pleasure, but always put in an appearance about dinner-time, when she was sure to get a meal of boiled fish or something else which seemed equally palatable; for she was not in the least particular, porridge or potatoes, or butter-milk curd, being apparently as much relished as newly caught sillocks. When the breeding season commenced, she always got a mate, and brought him with her to the house—to show, as I suppose, what a handsome one she had secured. The important duties of incubation on a high cliff not far distant having fairly commenced, and the cares of a rising family demanding her attention, her visits for some weeks would be infrequent and brief. In due time, she would appear on the lawn, accompanied by her lord and master and two or three well-grown *scories* (Shetlandie for young gulls). It was a sight to see her in the full glory of her summer plumage—lovely snow-white breast, bluish-gray back, and black-tipped wings—her head proudly erect, and every movement of her elegant form the perfection of tender grace and stately dignity, marching backwards and forwards, as though asking for approval, and pleased with the admiration she seemed conscious of inspiring. This bird was quite an institution about the house for I think at least five-and-twenty years. She is associated with my very earliest memories; and for years after I no longer resided in the old home, but annually visited it, it was no small delight to me to find my dear old friend healthy, hearty, and beautiful as ever.

Another of our pets was a 'Lesser black-backed gull;' but she kept closely to the garden, which she manifestly regarded as her especial domain, if one might judge from the violent indignation she exhibited, and the furious rage into which she wrought herself if any other bird, or a dog or cat, were introduced or showed face within the precincts of her half-acre. Some injury to her wing in her *scorie* days rendered her unable to fly; but indeed, even if she could have used her wings, it would have been a great risk to allow it; for this species, as I have mentioned, unlike the Herring-gull, regularly migrates southwards on the approach of winter; and probably the instinct to move off with her kind would have proved too strong for her local attachments, and we should have lost her. She died a natural death, at the advanced age of twenty-four.

Another of our pets was a 'Greater black-backed gull,' an immense burly fellow, a sort of alderman amongst the gulls, whose habits and practices were very similar to those of the Herring-gull. He came and went as she did, and like her, put in a daily appearance at the early dinner-hour of three o'clock, with a punctuality which was a standing reproof to some members of the family—myself, I fear, more than any one else.

The Glaucous gull is a magnificent bird, about the same size as the last named, but handsomer, and more active in his habits and movements. He does not breed in Shetland, but is a pretty regular winter visitor. We were very anxious to obtain a Glaucous for a pet; but the difficulty was to procure one without injuring him. Long and deep were the discussions we held, and many were the schemes proposed. At last we succeeded in capturing one. Like most of the larger species of gulls, the Glaucous is very partial to carrion of every description. A pony had tumbled over a precipice, and his carcass was washed up by the sea on a little beach hard by. We observed a fine young Glaucous taking his morning meal off the poor pony's bones. Here was a chance not to be let slip. First we tried a number of nooses; but failed. Finally, we adopted another contrivance, which happily proved successful. He was an exceedingly beautiful and handsome bird; but did not prove a very successful pet, for having experienced the sweets of liberty, he never became very familiar. We clipped his wings, and kept him in the garden, to the great disgust of our Lesser black-backed gull, who evidently regarded him as an interloper, and would fain have murdered, or at least extruded him, had he been able; but soon learning that he was no match for the Glaucous, he restricted his ill-temper to sulking and complaining. We kept our Glaucous in captivity for some months; till at last, not having noticed that his pinions required shortening, he took advantage of what was, for him at least, a favourable storm of wind, to make his escape, and we never saw him more.

The Great skua or 'Bonxie' is another of the gull tribe which we occasionally numbered among our pets. This bold and powerful bird, with his eminently robust frame and chocolate-coloured plumage, a king amongst the gulls, fierce and almost rapacious in his habits, is now rare in Shetland, where he appears about the end of April, leaving again in autumn, after the breeding season is over. A few pairs breed on the isolated island of Foula, a few on Rooness Hill, and a few on Hermanness, the most northern promontory of Unst. Their numbers, however, have latterly become thinned; the high market-price of their eggs, and the wanton, pitiless cupidity of rambling tourists, who thought no shame to shoot down the noble birds even in the middle of the breeding season, combining to all but exterminate the Great skua. It is to be hoped, now that the Wild Bird Preservation Act is in force, they will multiply. To be allowed to procure a young skua was an immense favour and concession. We had one for several years; and a most interesting and intelligent pet he was. The only drawback was that he was rather inclined to tyrannise over all other birds about the premises which might come within his reach, always excepting our gamecock

**Cœur-de-Lion.** The two had more than once tried conclusions; but the skua received such thorough chastisement for his daring presumption, that he soon learned habitually to acknowledge the superiority of his conqueror. He had an excellent appetite, and was quite omnivorous, anything and everything eatable being gratefully received, from new-caught trout or herring and sheep's liver, to cold potatoes and porridge. But I am afraid he did not always confine himself strictly to the fare provided for him; for it was pretty well known amongst us that several of Bessie Bell and Mary Gray's newly hatched ducklings, which had disappeared mysteriously, had passed into his greedy maw; so we needed to be very careful not to allow him opportunities of exercising his rapacious propensities, which he was but too ready to take advantage of when he wanted a specially dainty dinner.

We had a very effective trap for catching mice. A little grease of any kind was dropped in the bottom of a bowl and sprinkled over with oatmeal. The bowl was turned on a plate, and supported on the lip by a penny. *Monie* is the most simple and unsuspicious of creatures, and in this respect strikingly contrasts with her eminently sagacious and cunning congener, the rat. In her efforts to get at the tempting fare provided for her, she moves the treacherous dome; the supporting penny slips, down comes the bowl, and she is a prisoner. I thought our skua would not be unwilling to try his digestive organs on a mouse; so one morning I took the plate and bowl with a captive mouse to the tub in which he was washing himself, and dropped it in the water. In a moment he seized and swallowed it alive. The poor little creature, evidently resenting such treatment, and kicking against such an unceremonious proceeding, made it highly uncomfortable for the skua's gullet; so *mouseie* was quietly disgorged *still alive*. A pinch on the head speedily despatched her, and then she was swallowed without any further unpleasant consequences. Ever after that, when I caught a mouse in the manner described, and sallied forth with the plate and bowl, '*Bonxie*'—that was the skua's name—who perfectly understood what it meant, flew to me full of eager expectation. I raised the lip of the bowl the least thing, when, as neatly as possible he inserted his bill sideways, pulled out the little prisoner, killed, and bolted it. Ten or twelve mice were no more than a comfortable breakfast for him, and fare which evidently he enjoyed exceedingly.

Another of the gull tribe, closely allied to the last, which we frequently had amongst our pets, but were never able to keep for any length of time, was the Arctic or Richardson's skua. This elegant and active little bird, about the size of an ordinary pigeon, is much more common than the Great skua. Like his big congener, he is seen in Shetland only during summer and autumn. On the wing, he is one of the swiftest and most graceful of the feathered tribe. Some birds, as is well known, have a practice of simulating distress, in order to allure from the neighbourhood of their nests any one who may be approaching dangerously near; but no bird with which I am acquainted can approach the Arctic skua in this artifice. His acting is simply perfect. As Dr Saxby, in his admirable *Birds of Shetland*, says: 'There is not an ill that bird-flesh is heir to, which the shooi

[the Arctic skua's Shetland name] cannot convince you he is afflicted with.'

This bird has another peculiarity worth mentioning. He seems to disdain the laborious task of fishing for himself; but, from his proceedings, evidently regards all other birds of the gull tribe as existing solely for the purpose of catering for him. No sooner does he spy one carrying home, perchance, a supper to her hungry family, or contentedly and lazily hieing to some skerry with an evidently well-filled maw, than he gives chase, pestering the poor stupid gull unmercifully, and despite the latter's loud remonstrances, demanding of her to deliver up. Not relishing that all her labour should be lost, very possibly she bolts what she may be carrying, if she had not done so before, in the hope, no doubt, that with its disappearance the robber will desist. Vain hope. The little falcon skua is not to be put off in that way, and only becomes more imperative and more fierce in his attacks. Nothing for it, therefore, but to give up or disgorge the object of contention; which she does at last with a very bad grace certainly, and with a loud scream of angry disgust. Before it has reached the sea, it is snapped up and carried off in triumph by this freebooter of the air. Owing to this singular habit of the Arctic skua, we had a theory that there was some weakness or peculiarity in his digestive organs, which rendered it necessary that his food should be partially digested, or at least lubricated with foreign saliva, before it was in a fit condition for his delicate stomach. I do not know if there is anything in the notion; but certain it is we never saw him fishing or seeking any kind of food on his own account, like other respectable and industrious birds; and seldom ever saw him that he was not fiercely engaged in pressing and persecuting his neighbours in the manner and for the purpose described. Moreover, the young birds of this species were our only pets that never throve well in captivity; but notwithstanding the utmost care and attention, always pined away after a few months.

The variation in the plumage of the adult Arctic skua, as is well known to ornithologists, is very remarkable and very perplexing. There are two distinct varieties, and only two. One is dark brown all over; the other is of a similar colour on the back, head, and neck; but the lower part of the breast and the belly are white. It is not accounted for by sex, as we proved by dissection, and as we knew perfectly well from observing pairs, sometimes both of the all-over-dark-coloured variety, sometimes both of the white-bellied, sometimes one of each. There is also a marked difference in the colour of the young birds; one being dark chocolate-brown, and another a very light brown, and mottled almost exactly like a young hawk. There are two young birds in each nest; both may be of the dark or both of the light variety, or there may be one of each; while the parent birds are also of either colour, dark or white bellied indiscriminately. The strong presumption is that the lighter-coloured young birds develop into the white-bellied adults, and not, as some suppose, that the variety is referable to age. One great object with us was to solve this problem; but from our pets of this species never surviving the first winter, and so never reaching the moulting

stage, we failed to throw any light on so singular an anomaly.—But this is ornithology, and I am afraid rather a digression.

I pass over many more of our feathered pets, and conclude with a notice of Toby, whose memory deserves something more than a passing reference. Toby was a magnificent Cormorant, taken when very young from his nest on the side of a *hellyer*—Shetlandic for a cave or cavern into which the sea flows. He was easily tamed; and became one of the most familiar, intelligent, affectionate, and interesting of our pets. We very soon came to learn the exceeding appropriateness of the saying, 'voracious as a cormorant.' What a splendid appetite, what a capacious maw our Toby had! Fish he preferred certainly, and I should be afraid to state the number of sillocks or trout he could discuss at a meal. But so long as he got quantity, he was not in the least particular about quality. He was omnivorous, and no mistake. Nothing eatable, nothing digestible seemed to come amiss to him; mice, young rabbits, small birds, porridge, potatoes, bread, seal and whale flesh, being just as gratefully received and devoured as the freshest of fish. One day his breakfast consisted of twelve mice, which exhausted the supply, or I am sure he would have consumed as many more, for he was not half satisfied. Another day five plump starlings, wings, feet, bills, and all, disappeared down his throat with manifest gusto. Eight or ten sparrows were nothing more than a tolerably comfortable meal for Toby. Once he attempted to swallow a live young kitten, and had half accomplished the feat, when the poor little thing was rescued, evidently very much to Toby's disappointment and disgust.

Toby's favourite perch was the chimney top. When he saw any one coming to the house with a basket, or little boys with a string of small cod, down he swooped with an imperative demand for toll; and if his obvious wishes were not attended to, he made no scruple about helping himself without leave asked or granted, and the small boys at least were a deal too much afraid to offer any opposition. When Toby was nearly a year old, he was one day surveying the landscape from his elevated perch on the chimney. After considerable meditation, stretching out of his neck, and shaking his wings, he seemed for the first time to realise that the sea, which was not far distant, was a place he had a legitimate right to know something about, and that possibly he might find something there worth seeking. Toby was not the sort of fellow to hesitate from any fear of the unexplored region he saw before him. He was always bold and prompt in action. To our consternation, he made a grand plunge into the air, and flew off direct to the sea. We all thought he had taken final leave of us, for he had never before been known to roam beyond a hundred yards from the house. It seemed hopeless to follow; yet follow we did down to the beach in the direction we had seen him take. Our boat was hauled down, and for several hours we rowed about the bay, thinking, if we could only fall in with him, he was so tame and confident, he would come to our familiar call. But our search was fruitless; and we were obliged to return home discouraged and sorrowful. What, then, was our surprise and joy to find our favourite sitting on his accustomed perch, as happy and comfortable as possible;

his outspread wings, quiet, self-satisfied air, and general appearance of content, proving to us, who knew his manners so well, that his cruise, although a short one, had certainly, as a hunting, or rather fishing expedition, been highly successful. After that, Toby went daily to the sea and catered for himself; and we were very glad he did so, for it relieved our pets' larder very considerably. Toby was very fond of the kitchen fireside, and not unfrequently found his way into the dining-room in search of the head of the house, for whom he always showed the utmost fondness and affection.

Poor Toby! his fate was melancholy and tragic. My faithful old dog was as partial to the kitchen fireside as Toby was. He had reached the venerable—for a dog very venerable—age of twenty. Very deaf, blind, rheumatic, and nearly toothless, he was nevertheless honoured and cherished, as he deserved to be, and no one interfered with his favourite nook by the ingle. He had not only himself been honest and trusty during all his long life, but always exacted the strictest integrity of conduct from all over whom he had any influence or control, and would permit no peculation if he could prevent it. One day—fatal day for poor Toby!—no one but the old dog was in the kitchen. There happened to be some oatmeal cakes toasting before the fire. The door was open, and Toby hobbled in. He was never, it must be confessed, troubled with any scruples of conscience. I don't think Nature had endowed him with a conscience at all, and so he is not to be blamed. He was hungry; the cakes looked inviting; and they were temptingly within reach. Given these conditions and circumstances, and only one thing was sure to happen. Toby proceeded to help himself. The wrath and indignation of the old dog were roused. A brief scuffle ensued. Some one ran to see what all the terrible din was about; and found poor Toby in the death-agonny, with outspread wings and neck broken, the tell-tale cakes scattered upon the floor, and his slayer standing over him, and looking very much ashamed and crestfallen, and as though he was exceedingly afraid his well-meant, honest zeal had for once carried him too far. I do not know whether the effort had been too much for his feeble strength, or whether the reproaches of conscience—he had a conscience, without doubt—proved more than he was able to bear; but the fact is he survived Toby only a few days; and they were buried tenderly and sorrowfully side by side in a little patch of ground consecrated as the cemetery of Our Pets.

## HUMOROUS RETORTS.

A RETORT may be either civil or uncivil, courteous or uncourteous, witty or severe. The simple meaning of the word is thus given by a well-known compiler: 'To return an argument, accusation, censure, or incivility; to make a severe reply.' A few examples may not be uninteresting to the reader.

We must not always infer, because a man takes to the army as a profession, or for pastime, or even under any other circumstances adopts a military uniform, that a plucky and courageous disposition has prompted him to the act; or we might never have heard of the following: 'Many days to your Honour, and may God bless you, for you once

saved my life,' said a tattered mendicant to a Captain under whom he had served. 'Indeed,' replied the gallant-looking officer, with a smile; 'I have no particular recollection of the heroic circumstance. Maybe you mistake me for a doctor?' 'No,' answered the beggar; 'I served under you at the famous battle of Corunna, in 1809; and when I saw you run away, I thought it was high time for me to quit the scene of action too, or otherwise I should certainly have been killed.'

On the other hand, it is doubtful whether it is good policy to damp the ardour of a youthful aspirant to military honours, as was the case with the present writer, who, having joined the 37th Middlesex Rifles some years ago, arrived home one evening in high glee, and told his father he had just got his arms. 'Arms, indeed!' muttered the old gentleman drily. 'I am afraid your first thoughts on a battle-field would be how to make the best use of your legs.'

And however patriotic or brave we may imagine ourselves to be, it is perhaps not always advisable to boast of the same, or a cutting retort may await us, similar to that once received by a French officer, who, in a bombastical manner reproached a Swiss, with whom he was quarrelling, with his country's custom of fighting on either side for money; 'while we Frenchmen,' said he, 'fight for honour.'—'Sir,' replied the Swiss, 'I have no doubt we all fight for what we need most.'

It is also as well to assure ourselves that we are on the right side ere we venture to accuse any one wrongfully. In the 'good old times,' some soldiers robbed a night-watchman of his coat, boots, and money. The next day he repaired to the Captain of the regiment to complain of his misfortune. The Captain at once asked him whether he had on at the time the same things he was then wearing. 'Yes, sir, the very same,' replied the poor man. 'Then, in that case, my good fellow,' rejoined the Captain, 'I can positively assure you that the paltry rascals do not belong to my distinguished company, otherwise they would have left you neither waistcoat, trousers, nor shirt.'

At repartee the Rev. Sydney Smith had few equals, and he must have been a bold individual who attempted to banter words with that celebrated humorist. His humorous and deliberate manner of driving home a retort, a thick-headed Squire once discovered, who, being worsted by him in an argument, revenged himself by exclaiming: 'By Jove, if I had a son who was an idiot, I'd make him a parson.'—'Very probably,' replied Sydney; 'but I see your father was of a different mind.'

Evidently, we cannot be too cautious when we 'argue the point' with others, or too careful in the choice of an expression, especially with those who are reputedly known to be both sharp and clever. Sometimes the 'tables are turned' when we least expect it. A severe home-thrust was once given to a young country clergyman, who happened at the time to be walking home from church with one of his elder parishioners. It was a very icy day, when the latter suddenly slipped and fell at full length on his back. The minister, at a glance, feeling assured he was not much hurt, said to him: 'Ah, my good sir, pray give me your hand;

sinner's stand on slippery places.' The old gentleman looked up, and immediately answered: 'So I perceive; you certainly keep your footing remarkably well.'

A native of the Emerald Isle is credited with the well-known remark, 'that he never opened his mouth but he put his foot in it.' The subjoined example may be a case in point. An Irish member of parliament, boasting of his attachment to the jury system, in a room full of company, of whom Curran, the distinguished barrister and celebrated orator, was one, said: 'With trial by jury I have lived, and by the blessing of God, with trial by jury I will die!' 'Why then,' said Curran, in mock amazement, 'you've entirely made up your mind to be hanged, Dick!'

We shall also find that natural history plays a frequent part in the character of a retort; the following being of daily occurrence: 'As rough as a bear,' 'sharp as a ferret,' 'sly as a fox,' 'nervous as a kitten,' 'bold as a lion,' 'playful as a lamb,' 'timid as a mouse,' 'obstinate as a mule,' 'hungry as a wolf.' In our earlier days we may gain the distinction of being 'a young monkey,' and in our later years, of being 'pig-headed.' One's temper, however, is not very considerably ruffled by these mild allusions to the animal kingdom; a smile or a serious look, at the time, being sufficient retaliation.

A witty nobleman once asked a clerical gentleman at the bottom of the table, why the goose, when there was one, was always placed next to the parson. 'Really, my lord,' said the clergyman, 'your question is somewhat difficult to answer, and so remarkably odd, that I vow I shall never see a goose again without being reminded of your lordship.'

It is related of Lord Falkland, that in 1658, under the Commonwealth, his admission to the House of Commons was very much opposed by several members, he being barely of legal age. Some urged that he had not yet sown his wild-oats. 'Perhaps not,' he quickly retorted; 'but no doubt a good opportunity will be afforded me to sow them in this House, where evidently there are plenty of geese to pick them up.' The petulance of youth was here most forcibly exhibited.

A shrewd 'pawky' reply was given by one of the humbler folk to Lord Cockburn, who after a long stroll, was sitting on a hill-side with a shepherd, and observing the sheep had selected the coldest situation for lying down. 'Mac,' said he, 'I think, if I were a sheep, I should certainly have preferred the other side of that hill.' The shepherd answered: 'Ay, my lord; but if ye had been a sheep, ye would have had main sense.'

There is a class of peculiar people we sometimes observe at places of public resort, who endeavour by various means to make themselves remarkably conspicuous, it may be in dress, conversation, or general behaviour. At a cattle-show held in one of our county-towns, a country bumpkin, who for some time had been disturbing the company with his loud remarks, at last broke forth: 'Prize-cattle, indeed! Call these ere prize-cattle? Why, they ain't nothing to what our folks raised. You mayn't think it, but my father raised the biggest calf of any man round our parts.'—'Oh,' exclaimed a by-stander, 'we have no doubt of that.'

Then again, to be considered a donkey, is not altogether conducive to one's satisfaction or dignity; few, if any of us, caring to be classed with that much abused and villified animal. On one occasion, no small amount of merriment followed a retort, made by an indignant gentleman during a sale of pictures at a London auction-room. He and another disputed the possession of a capital picture by a celebrated English painter, which faithfully represented an ass. Each seemed determined to outbid the other. Finally, one said: 'My dear sir, it is of no use, I shall not give in. The painting once belonged to my grandfather, and I intend to have it.'—'Oh, in that case,' said his opponent, 'I will give it up. I think you are fully entitled to it, if it is one of your family portraits.'

To be equal to the occasion is with some persons a natural gift. We may mention an incident in connection with the famous French Marshal Bassompierre. During his incarceration in the Bastille, he was observed by a friend one morning to be diligently turning over the leaves of a Bible, whereupon the friend inquired what particular passage he was looking for. 'One that I cannot find,' was the reply—'a way to get out of this prison.' On his coming out of prison, Louis XIII. asked him his age. Fifty was all that the gallant soldier would own to. To the surprised look of the king, Bassompierre answered: 'Sire, I subtract ten years passed in the Bastille, because I did not employ them in your Majesty's service.' Some years, however, before this, when serving in the capacity of ambassador to Spain, he was telling the King how he first entered Madrid. 'I was mounted on the very smallest mule in the world'—'Ah!' interrupted the joke-loving king, 'it must indeed have been an amusing sight to have seen the biggest ass in the place mounted on so small a quadruped.' With a profound obeisance, came the quiet rejoinder: 'I was your Majesty's representative.'

Sometimes, too, it happens that some peevish sportsman in the field finds fault with the sport provided for him, as occurred a few years ago. A Yorkshire squire told Sir Tatton Sykes that in future he would make his appearance in the hunt on a jackass. 'Do, my good sir, by all means,' was the ready reply; 'and then there'll be a pair of ye.'

A remarkably witty reply was once made by an English architect, who had been giving an important opinion, and whose professional status the opposing counsel was anxious to depreciate. 'You are a builder, I believe?' 'No, sir, I am an architect.'—'Well, well, builder or architect, architect or builder, they are pretty much the same, I suppose.' 'I beg your pardon, sir, I cannot admit that; I consider them to be totally different.'—'Perhaps you will be kind enough to state wherein this great difference consists.' 'An architect, sir, conceives the design, prepares the plans, draws out the specifications—in short, supplies the mind. The builder is merely the machine; the architect the power that puts the machine together and sets it going.'—'Oh, very good indeed, Mr Architect, that will do; a very ingenious distinction without a difference. Do you happen to know who was the architect of the Tower of Babel?' 'There was no architect,

sir,' replied the witness; 'hence the confusion that took place.'

We naturally expect more from a professional, of whatever calling, than we should from an amateur. A single instance is here given to show that our expectations are not altogether groundless. The court jester of Francis I., complained that a noble personage had threatened to shoot him, if he did not cease joking about him. 'If he does so,' said the king, 'I should hang him a few minutes after.' 'If it makes no difference to you, Sire,' replied the jester, 'it would add considerably to my comfort and peace of mind if Your Gracious Majesty would hang him a few minutes before.'

We need not mention the particular county in which the following occurred; it is, however, very suggestive of the lively manner in which matters of a parochial kind are occasionally discussed in some districts. 'What a fearful thunder-storm we had last night,' said a gentleman on meeting with an overseer of the parish; 'the oldest inhabitant can scarcely remember a worse one.' 'So I have been informed,' was the reply; 'but the fact is, we had a meeting of the Town Council at the time, and none of us heard a single peal of it.'

#### WALKING-STICK GOSSIP.

To break off a branch for defensive purposes, as Crusoe did on finding himself on an unknown island, would be one of the first acts of primitive man. A rude support of this kind would soon be followed by the pilgrim's staff, familiar to us in pictures of the Patriarchs; and from these early staves down to the gold-headed cane of our modern dandy, what a variety of walking-sticks have been produced, according to the fancy and fashion of the time. When, in 1701, footmen attending gentlemen were forbidden to carry swords, those quarrelsome weapons were usually replaced by a porter's staff 'with a large silver handle,' as it was then described. Thirty years later, gentlemen of fashion began to discard their swords, and to carry large oak-sticks with great heads, and ugly faces carved thereon. Before very long, a competition arose between long and short walking-sticks, some gentlemen liking them as long as leaping-poles, as a satirist of the day tells us; while others preferred a yard of varnished cane 'scraped taper, bound at one end with wax thread, and tipped at the other with a neat turned ivory head as big as a silver penny.'

Sword-canes and walking-stick guns neatly constructed to look like ordinary sticks, are familiar contrivances; but that sticks and staves in the Tudor times were sometimes provided with the clumsy firearms of those days, is more surprising. For instance, we are told that a walking-staff of Henry VIII.'s had three matchlock pistols in it, with coverings to keep the charges dry. With this staff, it is said the king sometimes walked round the city, to see that the constables did their duty; and one night, as he was walking near the bridge-foot, the constable stepped him, to know what he did with such a weapon at that time of night; upon which the king struck him; but the constable calling the watch to his assistance, His Majesty was apprehended, and confined till

morning without fire or candle. When the keeper was informed of the rank of his prisoner, he sent for the constable, who came trembling, expecting nothing but death; instead of which, the king applauded him for honestly doing his duty, and made him a handsome present. More peaceably inclined folks had snuff-boxes, and sometimes watches, in the heads of their sticks. In a will drawn up in Latin, Archbishop Parker said: 'I give to my Reverend brother Richard, Bishop of Ely, my stick of Indian cane, which hath a watch in the top of it.' Some of these walking-stick watches may still be seen in collections of curiosities.

As all 'prentices were once expected to be skilled in the use of their 'clubs,' so to excel in the 'nice conduct of a clouded cane' was one of the requisites of the dandies of past days. Some of the advanced youths of our own time carry wax matches and cigarettes in the hollow handles of their 'crutch-sticks;' just as ladies find it convenient to have miniature scent and vinaigrette bottles inserted in the handles of their parasols. Very ingenious fishing-rods are made with hollow pieces to slide, telescopic fashion, one into the other; so that when all the pieces are in the bottom one, and a cap screwed over the end to act as a ferrule, the whole contrivance becomes an ordinary-looking walking-stick. One of the latest inventions in connection with our subject is the patent walking-stick telescope, the only noticeable feature of which when carrying it is the beauty of the wood. Under the handle of the stick is imbedded a small and very correct compass, neatly covered by a folding shield, in the centre of which is a small concave eye-glass. Each purchaser is supplied with a small concave eye-glass weighing only one and a half ounces. This object-glass, easily carried in the waistcoat pocket, can be used as a microscope, reading-glass, or cigar-lighter in sunny weather, and when fixed on the stick, forms a long-range telescope. It is easily slid upon the smooth portion of the stick, so as to alter the focus to any sight.

Stick-fanciers collect at times many curiosities in the way of metal-mounted, elaborately carved, and fantastically twisted walking-canes. Balzac used to exhibit himself at all public places of amusement in what was described as a 'rapture of self-satisfied vanity,' inspired by the possession of a cane nearly as big as a drum-major's staff, and all ablaze with rubies, diamonds, emeralds, and sapphires. It was grandly topped by a huge gold knob, which contained a lock of hair presented by an unknown lady-admirer. The outside was studded with all the jewels he had bought, as well as those he had received as presents. Enthusiastic admirers of Garrick declared that even his stick seemed to act; though whether the gold-headed cane with which his widow used for years after his death to go about, talking of her 'dear Davy,' inherited the spirit of the departed, we are unable to say. Many an unpretending-looking walking-cane is carefully preserved for the sake of the associations it awakens in the mind of the owner it has perhaps often accompanied in his pilgrimages. One of the largest proprietors of those palatial warehouses in Manchester made his way to that city with a small bundle and a crooked stick. The latter is said to be carefully preserved in a glass case among the archives of the firm.

When Sir Walter Scott, fording the Ettrick in company with his friend Mr Skene, slipped on a stone, and went headlong into a pool, emerging with no worse than a drenching and the loss of his stick, which floated down the river, the finder of that drifting waif would have little idea of the valuable memento of the 'Great Unknown' thus accidentally acquired. In short, whether used to hail 'buses, turn aside children's hoops, or drive away too intrusive dogs, the walking-stick is a blind man's guide and a universal friend, for which no man could show a higher regard than did the justice of Norfolk when he directed in his will to be buried in a full suit and bag-wig, and with his trusty cane in his right hand.

#### A FEW WORDS AT PARTING.

[A ship bound for Australia lies in the offing. A friend about to embark, thus speaks to a sorrowing friend whom he is about to part with.]

Yes, dearest friend; we'll ever keep  
The fondest memory of thee;  
O'er isles and continents can leap  
The mind, and rush o'er land and sea.

When kindred spirits own the power  
Of mental and of moral worth,  
They feel a union, hour by hour,  
Though separate by half the earth.

What though new paths before us lie—  
Though old familiar sights be far;  
Whene'er it wills, the mind can fly,  
Though changed the clime, though changed the star.

What though Life's ever-varying scene  
Must leave its mark upon the brow,  
The chequered Past will still be green  
With joy and grief, as it is now.

Though I must in Australia live—  
Let Fancy's sail be once unfurled,  
Let magic thought the order give,  
And magic thought shall cross the world!

Mind wed to mind, and heart to heart,  
Oh, friendship thus can ne'er be less,  
But greater; and, though oceans part,  
Can draw the bands of faithfulness.

Swifter than eagle in its flight—  
Quicker than steam or telegraph,  
The fleetest mind can outstrip light,  
And at the longest leagues can laugh!

Though mighty oceans 'twixt us roll,  
From earth's remotest end to end,  
The mind to mind, and soul to soul,  
Shall instantaneous message send.

Thy face and voice we'll ne'er forget;  
Though strangers may attention claim,  
We'll feel thee near, and hold thee yet—  
Though changed the clime, the mind the same!

## ON THE ARTIFICIAL FILTRATION OF WATER.

As illustrations of the process of filtration on a large scale, nothing better can be had, perhaps, than the filter-beds of the London Water Companies. They cover altogether close upon eighty-four acres of ground; and though they vary very greatly in their composition, the principle on which they are constructed is the same in all cases, and any one of them may be taken to exemplify the operation. The subject of filtration is one which at first sight may look simple enough, but it nevertheless affords scope for a good deal of diversity of opinion, both as regards theory and application.

In practice, all the Companies requiring to filter their water do so by allowing it to stand in huge reservoirs, the bottoms of which are porous, and supported on brick arches, which at once form the base of the filter-beds, and the roof of a water-tank, from which the purified water is pumped up into the mains. The composition of the filter-beds varies with each Company. The New River Company, the largest of them all, make their filters of two feet three inches of sand, underneath which are three feet of gravel, increasing in coarseness towards the bottom. Others are more elaborate. The Grand Junction Waterworks Company, for instance, make their filters by first depositing one foot of boulders, over which are nine inches of coarse gravel, then nine inches of fine gravel, six inches of hoggin, and two feet six inches of Harwich sand. The Lambeth and the Chelsea Companies, again, construct their beds of shells, as well as sand and gravel, though in different proportions, one having altogether eight feet of filtering material, the other only seven feet. The object of all of them, however, is to make a porous bed through which the water will percolate slowly enough to insure efficient purification, but yet not so slowly as to make the process too tedious and expensive. As to what should be the rate at which the process may be carried on to be effective, is a point upon which authorities differ somewhat. Dr Tidy con-

siders that it should be as nearly as possible two gallons per square foot per hour; Colonel Frank Bolton, the Water Examiner under the Metropolitan Act of 1871, thinks it may be two-and-a-half gallons. All agree, however, that it must not be too rapid.

What, it may be asked, has the mere rapidity of the water-passage through the filtering medium to do with the purification of the water? The answer to this brings into prominence two rival theories on the subject. It is evident enough that a part of the efficiency of any filter will depend on its power of intercepting in a merely mechanical way the foreign particles of matter that may chance to be contained in the water. In other words, a filter purifies water by straining it. It is clear, too, that the more gently this process is carried on, the better; as a rapid flow of water through the interstices of the sand, shells, pebbles, and so on, would be likely to carry through with it a good deal of extraneous matter, which might otherwise be left behind in the bed. There is, however, perhaps a better reason for very slow filtration afforded by another theory. It is obvious enough that a filter-bed is a kind of strainer for the water; and some have maintained that it is nothing more than a strainer, and that the process altogether is purely mechanical. Other authorities, however, have maintained that a very important chemical process goes on as the water percolates through the beds, and that it is important that the percolation shall be slow, in order to allow this chemical action to come into play. This action is what chemists term oxidation of organic impurity—that is, the chemical combination of organic impurity with oxygen gas. It is, in fact, the burning up of organic matter by a very slow and imperceptible process of combustion; just as in a more rapid and manifest way a piece of coal is burnt in a fire-grate.

In order to explain how this chemical action is supposed to be brought about by bringing the water in contact with sand, pebbles, shells, &c., it will be necessary to pay a little attention to a very curious phase of what is commonly spoken of as

capillary attraction. Everybody knows that if one dips his finger into a glass of water it will be wet—that is, a thin coating of the liquid will adhere to the finger when it is withdrawn. It is not everybody, however, who stops to ask *why* a thin coating of the fluid adheres. If a finger be similarly dipped into a glass of quicksilver, it may be withdrawn without a particle of the fluid adhering; though if half-a-crown be immersed, it will come out covered with quicksilver, just as the finger is with water. The surface of the half-crown exerts an attractive power upon the mercury sufficient to overcome the attraction which the particles of mercury have for each other. In just the same way the surface of the finger, though not exerting sufficient attraction to overcome the affinity of the mercury, *does* exert sufficient attractive power to overcome the natural affinity of the particles of water for each other. The water is drawn out with the finger by virtue of a surface attraction. It clings to the finger more tenaciously than to the rest of the water. It will be just the same with a pebble. A pebble taken out of the water will have a thin coating of the fluid about it, because the surface of the stone exerts a positive attraction greater than the attraction of the particles of the fluid for each other; and it has been further ascertained that even when in the water, a pebble will, by virtue of this attractive power, condense around it, in a close concentrated form, that coating of the fluid which appears upon the pebble when taken out of the water.

Now, let the reader carefully note this. Just as the pebble when immersed in water has around it a thin concentrated film of the fluid, so that same pebble, when immersed in a thinner fluid—the air, for instance—will, by virtue of that same attractive power, incase itself in a thin concentrated film of that thinner fluid. In other words, a pebble or piece of rock when lying in the open air is not merely surrounded by the air, but is entirely enveloped in a closely condensed atmospheric film.

Now, if that is clearly understood, it will be easy to perceive how it is that water containing a considerable amount of any organic impurity will be purified by falling upon a rock, and that, too, without leaving any deposit of its impurity upon the surface of that rock. Not only will the impurity be decomposed and eliminated by the surrounding atmosphere, but the process will be carried on with special rapidity and completeness by this concentrated air clinging to the rock. The oxygen of that concentrated air will enter into chemical combination with the elementary components of the organic impurity, whatever it may be—sewage matter, decaying vegetable, and so forth—and that impurity will be converted into carbonic acid gas, ammonia, and water. Thus, the polluted water will be purified without depositing any of its oxidisable matter on the surface of the stone.

Now, we may understand the explanation which some authorities have given of the action of such filter-beds as those of the London Companies; and which it should be remembered are only modifications of the natural process of filtration up through beds of gravel and sand, from which the best of spring-water flows. These authorities say that the sand not only acts as a strainer, but it performs the office of the rock in bringing every

particle of the water into close contact with the air. The sand, they tell us, is but a vast collection of minute rocks; and every grain of sand is a particle of rock, incased in a film of air just as we have been describing. They say that the water, in passing over the surfaces of these innumerable little stones, presents its impurity to the action of their air-surfaces, and that that impurity is thus not merely arrested, but that it is decomposed, and converted into carbonic acid, ammonia, and water. In proof of this, they refer to certain analyses of the sand-beds of the Chelsea Company, at a time when the Thames was so abominably foul that the House of Commons could not endure the windows open for the stench of the river. After the Chelsea filter-beds had been purifying this liquid for many weeks, the sand was examined; and only one and a quarter per cent. of deposit was found—a quantity far less than the water must have brought in with it and left behind. Other observations and experiments tend to confirm the opinion, that slow filtration through beds of sand and gravel not only arrests the suspended matter that may be contained in the water, but removes at any rate a considerable amount of its dissolved organic impurity by chemical action. The point is, however, we believe, still a moot one.

But though this may be the case with regard to sand filtration, there is no question that there are other materials which exert both a mechanical and a chemical purifying influence to a very powerful degree. The most familiar of these substances is charcoal. Charcoal, as everybody may see by close examination, is an exceedingly porous material. It is full of minute cavities, which must present an immense surface-attraction to the air, and which suck up air just as a sponge sucks up water. Now, it is easy to perceive that if a lump of charcoal is an agglomeration of little particles thickly coated over with air, we have only to allow water to trickle slowly through its substance in order to bring every particle of it into close contact with that atmospheric coating. The result will be just as we have already described—any impurity will not only be arrested in a mechanical way, but will undergo chemical decomposition, and disappear. There are many substances which have this purifying property. All porous and fibrous materials have it more or less; hence foul water passed through a layer of cotton-wool, sponge, spongy iron, pumice-stone, &c., will have much of its impurity removed. Clay, too, is a marvellous purifier of fluids passing through it. It is obvious, however, that any material liable to decay, such as sponge or wool, may impart greater impurity than it arrests, and should never be tolerated in a domestic filter. Moreover, although there are a good many substances which are capable to some extent of purifying liquids passed through them, they are not all equally efficient.

Till recently, animal charcoal was considered the most satisfactory filtering medium. It has been calculated that a pound of animal charcoal will arrest the impurity of one hundred and thirty-six pounds of the filthiest of water, provided it be passed through slowly enough to keep every particle of the water in contact with the charcoal for at least four minutes. The one objection to charcoal as a filtering material is that it feeds any organic life the germs of which may be in the

water passing through it. Silicated charcoal was introduced as an improvement in this respect; but it has been pronounced not absolutely free from this objection. Spongy iron completely obviated this difficulty, and appears to be in all respects a thoroughly efficient filtering material; though in its turn it seems likely to give way to a new medium which has been announced by the scientific authorities of the Military Hospital at Netley, where a series of experiments have been completed, the result of which seems to be to put spongy iron second on the list of the best media for domestic filters. Silicated carbon comes third; and pure animal charcoal next. But the new material is said to eclipse them all in its power of eliminating organic matter ammonia nitrous acid, and other objectionable ingredients in water for domestic purposes.

This newly invented substance is, we are told, compounded of carbon, iron, and alumina; and it has been designated *carferul*. This—if further experience of it should confirm the opinion formed of it—seems very likely to supersede all other filtering media for use on a small scale. For filtration on a large scale, there is no reason to suppose that any better medium can be devised than that afforded in some such form as the London Companies' filtering-beds. It should be observed, however, that whatever the filtering substance may be—whether sand, clay, sponge, carbon, spongy iron, or *carferul*—its power of filtration is only temporary. It cannot indefinitely keep on straining out impure matter, or transforming it by chemical action, without clogging up and exhausting its power. However good and efficient a filter may be, therefore, there comes a time when it is efficient no longer, and when any water passed through it will certainly receive more impurity than it loses. The exact period at which this occurs is, of course, a matter depending on the nature of the filter, and the amount and condition of the water which is passed through it.

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER XXXVI.—THE PROGRESS OF THE PLOT.

'Two, for the Scilly business; two, for the regular trade of the "Islands"—all to be built of iron and steel, and for speed. Customers in Covent Garden Market can't wait for their early potatoes and early peas, and March asparagus and April strawberries. Can they, Mr Weston? If Scilly don't send them, Portugal must, or Algiers must; and we had better be first on Tom Tiddler's Ground—eh, Mr Weston?'

A shrewd man, in his way, was Mr. or Commodore, Harris, a notable inhabitant of Southampton, who had certainly been steward of a West-Indiaman in his youth, and was rumoured to have been a cook's boy on board a West-Indiaman in his childhood, but who now owned thirty keels in the short-voyage line. He had just, sure of the success of his speculation, ordered four steamers from the great ship-building firm—two to range around the fertile isles of Jersey and Guernsey, wild Sark, and pastoral Alderney, where agriculture means market-gardening, and money is abundant; and two to speed the actual

garden products of early Scilly, with its fuchsias and myrtles and precocious vegetables, to the omnivorous mouth of rich and greedy London.

'And quite right too. We'll prepare the contracts as soon as the Principal and yourself, Commodore, have squared it about the price—and I'll warrant the craft are to your liking, Harris,' responded Mr Weston genially. 'Glass of sherry, Harris, to wet the bargain.'

The Commodore and Mr Weston had not yet finished their sherry before a tap, tap of modest knuckles resounded on the door, and a small, pink-faced, beardless clerk presented himself to announce, in a piping voice, that Mr Crawley craved an interview.

'Presently—with pleasure,' said Mr Weston, waving his hand. The juvenile clerk disappeared.

'Don't let me keep you,' put in Commodore Harris, sipping his sherry, which was sound and strong.

'No hurry, pray,' answered the Manager. Bargains for sea-going vessels worth several thousand pounds ought, in Mr Weston's old-fashioned conception of the fitness of things, to be solemnly celebrated with a libation, perhaps to Neptune.

'Crawley. Yes; that's your head-man here?' asked Mr. or Commodore, Harris.

'Head-clerk; yes. But the Assistant Manager, Mr Oakley, Bertram Oakley, takes rank above him,' was the answer.

'Don't know him—never saw him. Crawley, when he brought me the sketch of the estimates, seemed a steady sort of chap—and adds up figures like Cocker himself,' said the shipowner.

'Crawley is an excellent clerk—slow, perhaps, but as steady as Old Time. I rather like a man to be slow, so as he's sure,' added Mr Weston, who was slow himself, and was suspicious of quick brains in others. 'I have a regard for Crawley, whom I trust, and whom I understand. A good Assistant Manager he would have made, if our Mr Mervyn'—Here Mr Weston shook his head meaningly, and the Commodore finished his glass. 'A little more wine, Harris?'

But the shipowner would have no more sherry, and soon departed.

Almost as the door closed on the retiring figure of the Commodore, it opened to give admission to Mr Crawley. The steady head-clerk seemed strangely agitated. His unwholesome face was at a dull white-heat, so to speak, and there were blotches of pink on his pale forehead. He was hot, eager, trembling.

'Nothing wrong, Mr Crawley?' asked the Manager.

They had known one another, these two men, for twelve years, yet it was remarkable how little, except during office-hours, they had seen of one another. It was not Mr Weston's fault. He had invited Crawley to his house perhaps eight or nine times in the dozen years. But the hospitality had proved a failure. Mrs Weston had never liked Crawley. Crawley, at the Weston dinner-table, had been as mute as a fish, opening his ugly mouth only to absorb viands and wines. The daughters had by no means approved of Mr Crawley, who was not a ladies' man, was not a men's man, was nothing but an arithmetical text-book transmuted into flesh and blood. Still,

Mr Weston had an esteem, in business hours, for the confidential clerk. He had never seen Crawley agitated before. There was something portentous in the stirring-up of that negative, secretive soul.

'I am afraid, sir, that something is wrong,' said Crawley, dropping into the chair that was offered to him, and rubbing his moist brow with damp cambric. 'In all the years I have served the firm, I have never felt any position so painful, or so perplexing, as I find it to-day. I do not know,' added Mr Crawley ingenuously, 'whom to suspect, or whom to accuse; and yet there must be guilt somewhere,' he said despondently.

'What's the matter, and what do you mean?' demanded Mr Weston gruffly; and then more gently added: 'I did not mean to hurry you, Mr Crawley; but I am naturally anxious to know the meaning of all this. It must be something serious, I should say.'

'So it is,' answered the confidential clerk, dropping his eyes to the carpet and speaking in a low voice. 'With your kind permission, sir, I will explain the affair.'

Mr Crawley's explanation, which was sufficiently lucid, came to this. The Fittings' Store, so called, of Messrs Mervyn's Southampton Yard was a roomy warehouse, that contained miscellaneous but valuable materials employed in equipping vessels for sea. Copper sheathing was kept there, and so were rods and ringbolts, and brass-work, and tools and nails, and nuts and screws, and bolts and rivets, the costly fittings of steamers, and the expensive trophies of arms and gilded mirrors and moulded stanchions that figure in the cabins of dainty yachts. All sorts of goods, handy, portable, light, easily converted into money, were kept there, and, of course, under a system of sensible precautions.

'We must be careful, sir,' said Crawley, with his ghastly smile. 'Copper and nails and so forth are a shipwright's sweethearts, as the saying is, and'—

'And he will steal them, if he gets the chance,' interrupted Mr Weston, catching fire from the excitement of his subordinate. 'But then, of course, he ought not to get the chance. Our men are picked men, of good character; but it would be cruel to put temptation in the way of a set of rough, uneducated wrights, and I am sure no check has been omitted.'

'And yet, sir, Warren himself told me, with tears in his eyes,' began Mr Crawley slowly, 'and Warren is a trustworthy man'—

'I should think he was. Old Warren! No, no, Mr Crawley; whatever may be wrong with the materials, Sergeant Warren, the storekeeper, is blameless. I would as soon think of suspecting you, or myself,' said the Manager warmly.

'So I thought, sir,' responded the confidential clerk, with his ghastly grin. 'Still, things are missing—no trifles, such as might be easily purloined, perhaps thoughtlessly snatched up by one of the men, but quantities of well-selected property, which it must have taken time to select, and time to remove. Would you wish to see Warren himself, sir?'

'By all means. Let him come in,' replied the Manager, with a troubled brow.

Warren, the storekeeper, entered, and made his military salute, and drew himself up, stiff and

respectful, as he had done many a time, in his commanding officer's tent, on some sultry evening in India. Tall and thin and gray was Jacob Warren, once a stalwart Sergeant-major of Lancers, and who still, in his civilian capacity, wore on the breast of his tight coat the medals and clasps that he had won in old battles against Sikh and revolted Sepoy. He limped a little too, in consequence of an old wound. Altogether, Warren, with his honourable past and his long services, did look a man to be trusted. He was almost sobbing, now, as he entered the office.

'Something amiss, Warren, I am sorry to hear,' said the Manager. 'Come, don't take it to heart so, man. Nobody blames you.'

'I am afraid it seems like neglect of duty, sir,' said Warren, who stood 'at attention,' with his hands rigid as the pendulum of a clock, by his side. 'And yet, sir, if you'll believe me, I've kept a look-out, faithful to orders. Artful beggars, Mr Weston, are at the bottom of this—very artful.' And the storekeeper went on to relate how a quantity of the more valuable property under his charge had been removed, evidently by some person or persons well acquainted with the contents of the warehouse, and so dexterously, that a screen of wire-rope, chain-cable, and other bulky objects, had been left between the emptied compartments and the front of the building, and that all other objects were apparently undisturbed. The work of plunder had—so Warren conjectured—been going on for some time, and the deficit was large, though how large the storekeeper could not tell. 'But how, unless the Evil One himself helped 'em, the thieves got in,' was beyond Warren's power of guessing. The old soldier was much distressed, and seemed to think some slur rested on his own fair fame, in consequence of the mysterious disappearance of his employer's goods.

'No one blames you, Sergeant, remember that,' said Mr Weston kindly. 'Don't talk of this, however, until we have time to make a strict inquiry into the matter. That will do for the present.'

And, with his stiff martial salute, the ex-Sergeant-major retired.

When they were left alone together, Messrs Weston and Crawley looked into one another's faces.

'An unpleasant business, Mr Crawley,' said the Manager.

'A bad business, sir,' rejoined the confidential clerk.

'This key,' pursued Mr Weston, unlocking a private drawer of his desk, and taking out the key he spoke of, 'has never been out of my own possession, except when it has been intrusted for a short time to one of our young clerks, who has accompanied Warren and the men who acted as porters, to and from the Fittings' Store. And for all materials, proper receipts have been signed by the foremen or overlookers. Warren himself has no means of access to the warehouse at other times.'

'No, sir,' said Crawley, as if meditating. 'That is true. There are but two keys. You have one; and young Mr Oakley, the Assistant Manager, has the other.'

Mr Weston could not repress a little start. 'Ah, well, I must speak to Mr Bertram about it,' he said, after a pause.

'If I were you, sir, if you will excuse the liberty I take in offering advice to one so much more capable than myself,' said Mr Crawley smoothly, 'I would keep the matter quiet and to ourselves for a little while, at first. Young men will be— young men; and with all Mr Oakley's cleverness, he has not had much experience, and might bungle the matter, and so cause the escape of the real culprits, who must, it seems to me, have a knowledge of the premises. If the detective, sir, whom you consult'—

Mr Weston had not spoken, or perhaps thought, of consulting a detective; but he willingly, as dull men often do, appropriated the idea as his own. 'Ah, well, we shall see,' he said. 'I'll drop in at the police station as I go home; and in the meantime, Mr Crawley, mum's the word!'

### TEA AND SILK FARMING IN NEW ZEALAND.

#### SECOND ARTICLE.

HAVING in a former article, to which we would refer the reader (No. 899, March 19), offered a few statistic, climatic, and commercial reasons for the encouragement of tea-growing and silk-culture as a combined industry in New Zealand, particularly in the charming province of Auckland, we now propose to supplement that paper with some arguments, dealing chiefly with the suggested enterprise, as suited for the employment of educated yet reduced gentlewomen, whose means of living were now, through misfortune or other causes, not such as they had been accustomed to. That the merits of this view may be properly appreciated, it will be desirable to refer briefly to such of the manipulative operations as in other countries are undertaken by females, in order to show that similar duties might be efficiently performed by the educated intelligence of lady-emigrants, and that the employment need not rob them of one iota of dignity, or lower them a single inch in the social scale.

In a Chinese tea-garden, the first duty for which female co-operation is in demand occurs in leaf-plucking, on the careful, intelligent, and conscientious performance of which much of the subsequent high character and value of the finished produce depends. Where ignorance was rampant, as in the early days of some of the Indian tea-plantations, the blameworthy habit of stripping the branches—that is, grasping them at their junction with the main stem, and drawing the closed fingers sharply along, thus clearing them at one sweep of every bud and leaf—was frequently practised. It was a most reprehensible custom, as the planters soon discovered, and was indulged in by unscrupulous pluckers, when safe from the eye of supervision, in order to save themselves trouble, and quickly augment the contents of their baskets, thereby completing the day's 'task' in the shortest space of time. The practice was physiologically damaging to the tea-bushes and fatal to the value of the finished tea, turning out, as it did with such rough manipulation, a mere confused aggregation of leaves of all ages and sizes—a piebald and harlequin-looking mixture, badly plucked, unevenly fermented, and pleasing neither to palate, nose, nor eye. In China, the home of tea-

farming and preparation, such serious but quite preventable practices could scarcely happen; and we think we may venture to assert that where British ladies and girls of even the most ordinary education were employed, such wilful bungling would be next to an impossibility.

On the arrival of the tea-season in Hou-nan and Hu-peh, and doubtless also in the other districts, the more experienced among the leaf-pluckers—who have previously undergone a system of dieting and sanitary supervision, so as to avoid the risk of communicating any taint to the delicate flowery pekoe they are about to handle—are marshalled in select companies and taken to the scene of their pleasant labour. By dawn, a day or two afterwards perhaps, hundreds, sometimes thousands of merry, black-eyed, well-dressed girls may be observed tripping gaily along the raised banks of the paddy-fields to the gardens, situated on the hill-slopes beyond; all unmistakably evincing the keen interest they feel in the agreeable and healthful work to which they are hastening. Reaching the gardens, each detachment—accompanied by coolies to bear away the pluckings to the central drying-shed or manipulating *hong*—begins upon a separate plot of tea-bushes; and in a few hours two of every three leaves have been carefully removed, the terminal leaf of every branch or twig being usually allowed to remain.

Let the reader now, in imagination, transfer the scene from China to the margin of one of the enchanting lakes of New Zealand, with the bold ruddy children of British emigrants—and in the good time coming perhaps troops of laughing little Maoris, and sedate and solemn-looking Celestials—for pluckers, superintended by intelligent ladies and girls from home; some on foot, and others on stout Australian palfreys, bustling about the plantations and directing the busy crowd. To some of the languid among the gentler sex in the old country, on whose features an unmodified sunbeam is never permitted to rest, a sketch such as this may seem pregnant with freckles and other causes of dismay. Yet those who have already spent years in New Zealand's delightful climate, and who have had other experience as well, agree that nowhere else, except perhaps in the Sandwich Islands, is an open-air life more enjoyable, and the toll exacted by the sun more merciful.

Not only in the field might the services of educated females be utilised, but to some extent in the factory also. It is well known to travellers who have spent their time intelligently in the tea-districts of China, that the finest and most expensive tea of that country is never exported, for the simple reason that, being only sun-dried, and scarcely 'fired' at all, it would decay on the voyage to Europe or America, and turn out offensive and utterly useless on its arrival. But although it could not endure a long voyage, the few days occupied in a passage to Australia from Auckland would inflict no material injury, so that this rare and fragrant tea might easily be enjoyed by our relatives in Sydney and Melbourne at least for a few weeks every season. The preparation of this exquisite article, samples of which never decorate the brokers' tables in the London market, might be left almost wholly in the hands of the ladies connected with the New Zealand Tea

and Silk Company's establishment, as, there being no rolling, fermenting, roasting, and very little firing necessary—only some twisting, curling, exposure to the sun, and loose packing in small tins, leaden canisters, or jars—such trifling manipulation could easily be undertaken by even the least robust among them, and seem more in the nature of part-time than labour. In any case, the ladies would have the satisfaction of knowing that the produce of their fingers would probably command an exceptional price, like that alluded to by Mr Simmonds in his interesting work on the Commercial Products of the Vegetable Kingdom. 'For delicacy,' he says, 'no teas approach those called "Mandarin teas," which being slightly fired and even damp when in the fittest state for use, will bear neither transport nor keeping. They average twenty shillings per pound, and are in request among the wealthy.' In the preparation of brick-and-tile tea; powder-tea after the Japanese formula for native Asiatic use; compressed tea and concentrated essence for the convenience of the army, navy, and travellers, many situations would eagerly welcome the deft fingers of the fair; whilst in the production of tea-seed-oil—one of the purest and most delicate for cooking and other purposes—and oil-cake from the refuse, for cattle-food—a substance which chemical analysis shows to be superior in fattening properties to even the finest linseed-cake—numbers of poor uneducated women and children might be employed at the termination of every season.

If, in the midst of the dust, heat, and noise of the usual tea-manipulating and firing-chambers, there should scarcely be any appropriate place for women, there would still be room for them in the weighing and packing departments, as, an ever-increasing demand for decorative designs where-with to ornament the packages being anticipated, sketches of native scenery and character would be constantly required; thus affording profitable and agreeable scope for the abilities of all those who were artistically inclined.

Important, then, as the services of educated females must prove in one great department of the proposed undertaking, they would simply be invaluable in the other. Since the days of Si-ling—who is said to have flourished twenty-six hundred years before Christ, and to have been the first to introduce the culture of silk to her subjects—to the present time, almost every branch of this important industry has been under the care of females. The proposal, therefore, to employ educated ladies and girls in *silk-culture* in New Zealand can scarcely be pronounced a novelty. In China, even at this day, silkworm rearing is regarded as almost of a sacred character; and the whole industry, as well as those engaged in it, are looked upon with deferential respect. Chinese females of all classes, from the most remote antiquity, and with education and acquirements vastly beneath those of civilised nations, have devoted much of their time to the occupations of feeding and rearing silkworms, so that the industry in its widest sense may truly be considered a national one. Keeping this in view, and taking into consideration the fact that as the result of comparatively ignorant female labour there was, after supplying its own requirements, imported from China to the United Kingdom in 1863 ten and a half million pounds of raw silk, we

cannot avoid speculating on the enormously greater quantity which might possibly have been forthcoming, had British women of education been largely engaged in the pursuit either there or in New Zealand.

Even in England, notwithstanding all its climatic drawbacks, some surprising triumphs in silk-culture have been achieved by ladies. Among others who have either personally engaged in the industry or given it their countenance, we need only name Lady Bentinck, Lady Lucy Calvert, Lady Mills, Lady Dorothy Nevill, Lady Ramsay, Lady Macarthur, Mrs Bladen Neill, and Mrs Whitby, all of whom have taken an interest in or endeavoured to establish the industry as a national occupation in England and Australia, and who, no doubt, would prove equally enthusiastic in promoting it in the far more congenial climate of New Zealand.

Before proceeding to indicate the nature of the work involved in connection with the raw material termed silk, let us glance for a moment at its producer the silkworm. As our readers doubtless know, all butterflies and moths undergo certain changes in their life-course, termed transformations. Thus the common white butterfly of our fields in due course lays its eggs, out of which emerge larvæ or caterpillars which voraciously devour cabbages and other green leaves. Fed to repletion, these caterpillars at length show symptoms of languor, and in many cases weave for themselves silken shrouds or cocoons within which, and changed as to appearance, they remain in the condition known as the chrysalis; from which, in fullness of time, bursts the imago or perfect insect, ready to wing its joyous flight. So with the silkworm—which is neither more nor less than the caterpillar of a certain kind of moth, and whose chief food is the mulberry leaf—the silk of commerce is simply the unravelled shrouds within which the caterpillar or 'worm' has interwoven its body. The four stages in the life of a moth are, therefore, egg, larvæ or caterpillar, chrysalis or pupa, and imago or perfect insect.

With these remarks regarding the natural history of the insect, let us now refer for a moment to the nature of the work devolving upon those who would follow the interesting occupation; and this cannot be better illustrated than by a short reference to the progress of a single brood of silkworms. Suppose, therefore, that one ounce of eggs are required to be hatched, the period chosen for incubation must be coincident with the bursting of the mulberry into leaf. Formerly, there was no option or choice in the matter; the worms appeared at the usual season, if the temperature happened to be suitable, whether there was food for the little creatures or not. If the latter unfortunate circumstance happened, the brood perished. But means are now available for retarding the vivifying of the eggs, through the agency of ice, so that the 'grain' can be kept for a considerable time in refrigerators during backward seasons, until the mulberry has produced its first young leaves. That no evil effect follows this apparently unnatural expedient, was proved about two years ago, upon a scale of some magnitude, by Captain Mason of the Manor House, Yateley, Farnborough, Hampshire, one of our most distinguished home-silk growers. He found that the worms from five ounces of eggs taken

from a refrigerator, where they had been for some time during the progress of his hay harvest, in the fourth period of their existence, managed to devour six thousand one hundred and fifty-five pounds of mulberry leaves in the course of a fortnight. In the practice of silkculture in New Zealand, however, it is believed that recourse to any retarding measure—except in the case of eggs forwarded from Europe or America—would be unnecessary, on account of the equability and geniality of the climate stimulating the mulberry into leaf year by year about the same date.

As soon, therefore, as the mulberry bushes evince signs of commencing to bud, the eggs are placed in a temperature of sixty degrees Fahrenheit, which is gradually raised during ten days to eighty degrees. On or about the tenth day, the worms issue from the egg, and must be immediately supplied with young leaves, shred very small, so that as many raw edges as possible may be presented to tempt their appetites. The temperature is now allowed to drop five degrees; and the range is afterwards maintained between seventy and seventy-five degrees, a higher figure usually proving inconvenient, and sometimes even fatal, to the rapidly growing creatures. During the next five or six days the worms—which to prevent them from wandering are kept upon roomy trays—must be fed with freshly chopped food every six hours, and kept scrupulously clean. At the end of this period, the consumption of leaves will have been from seven to fifteen pounds; when the little revellers pause for twenty-four hours, apparently from repletion, but really in order to cast skins which have become painfully tense outside their swelling bulk. This epoch is called the first sickness, and precedes the second period of life.

As soon as the old integument is sloughed, the worms are again fed as before, having been carefully removed to clean trays, and allowed additional space. The second period lasts for about four days, during which from twenty to thirty pounds of leaves ought to have been devoured. Again their skins become too tight, and are abandoned during the second sickness. The endurance of the third period is about a week; and on the eleventh day or so from incubation, the worms fall into their third sickness, after having eaten from sixty to eighty pounds of food, when their skins are once more cast. About the seventeenth day, another moulting occurs, after which the voracity of the little gluttons becomes amazing.

According to one Chinese author, each healthy worm, from this point onwards, devours about ten times its own weight of leaves per day. As a necessary result, their copious discharges and exhalations render the most prompt and exact cleanliness absolutely necessary for their well-being as well as for the comfort of the attendants. By the twenty-second day, the fourth period will have been completed, when the worms—the produce of one ounce of eggs—will probably have consumed from a hundred and twenty to a hundred and sixty pounds of leaves. During the fifth period, which lasts about ten days, the worms will have assimilated from eleven hundred to twelve hundred pounds of food. At the termination of this age, signs of restlessness usually appear; and the now thoroughly gorged cater-

pillars commence hunting about for convenient nooks in which to spin, which ought to be in readiness in the form of little bundles of common broom fastened so as to resemble miniature hedges, eighteen inches high, around and across the trays in which they have been last fed. Should any of the worms evince an apparent desire for more food, as they sometimes do, it ought to be immediately offered, as the more heartily they devour, the better and more profuse will be the yield of silk. It is considered a fair test, indeed, of what is termed 'a proper education,' that the worms hatched from one ounce of eggs should at this point have masticated at least fifteen hundred pounds-weight of fresh mulberry leaves.

It will be understood, of course, that the figures just given must not be regarded as definite, and unvarying from year to year. On the contrary, considerable variations supervene, according to the robustness of the worms, the locality in which they are fed, the equability of the temperature, the prevailing weather, the condition of the mulberry trees, and the aptitude for the industry, and the vigilance displayed by the persons engaged. Taking as our guide certain statistics of districts in France and Italy, we would say that, as a rule, one ounce of healthy eggs should produce silkworms, which ought to eat during their first period of five days, about seven pounds of leaves; second period of four days, about twenty-one pounds; third period of seven days, about seventy pounds; fourth period of seven days, about two hundred and ten pounds; fifth period of seven to seventeen days, about twelve to thirteen hundred pounds. Total of five periods of thirty to forty days, about fifteen to sixteen hundred pounds of leaves.

A certain degree of irregularity, therefore, is evidently a feature in silkculture, and it is this element of uncertainty, united with others, which renders the industry somewhat precarious when intrusted to uneducated persons who are guided by tradition and the rule-of-thumb rather than by the teachings of science. It will perhaps be admitted, however, that conducted with superior intelligence and scientific appliances, such as the ladies and officers connected with the proposed syndicate would bring to bear, the profession could hardly fail, in such an equable climate as that of Auckland, soon to rise into one of the most permanent of industries.

About the thirty-second day, when the now full-grown and satiated caterpillar begins to emit its fragile silken line, the cocoon and the sixth period are commenced, the former being usually finished in four days, when the worm undergoes its last change but one, fluffing off its already frequently changed skin as a caterpillar, and becoming a chrysalis. Four days more are generally allowed, when the cocoons are carefully removed; and if the education has been thorough, the worms healthy, and all have survived, the result should be about one hundred and twenty pounds-weight of cocoons for every ounce of eggs hatched.

Here, although not yet the conclusion of our illustrative incubation, the special duties of the ladies of the establishment might probably cease, as the stifling of the worms in the cocoons intended for export, could scarcely be considered a lady-like employment. But at some future date, when silk-

reeling may have become understood—if happily, this special branch in the meantime has not been superseded by the success of a curious device at present under consideration—this delicate and difficult operation, namely, the unravelling of the shroud, would fall to their care. When such a degree of efficiency has been reached, it would still become an object of attainment to obviate the objectionable sacrifice of insect life, at present the rule, in subjecting the cocoons to a degree of heat which kills the chrysalis within. One economical object to be thus gained is taught us in a lesson from Syria, where the cocoons which are smartly unwound before the developed moths have had time to perforate their silken prisons, yield fifty per cent. more silk than after the stifling has been accomplished. Indeed, it is hoped that ere long, means will be arranged of obtaining silk direct from the spinnerets of the worm, without the intermediate form of a cocoon, or compromising the comfort and safety of the creature whilst undergoing its final transformation. As soon as this great issue has been achieved, we need scarcely say that all further anxiety about the difficulties of reeling as at present conducted will vanish, for the process will no longer be required. The whole of the moths, instead of only a very small percentage, would be thus saved to complete their natural functions and term of life; and the quantity of eggs produced would be enormously increased; and, if necessity should arise, might serve to replenish the stores of Italy and other European and Asiatic silk-countries.

It will have been gathered from the foregoing that the responsibility, attendance, and portage connected with the incubation and feeding of the worms from even one ounce of silkworm eggs, are considerable. In the case of the proposed Company's first plantation of one hundred acres of mulberries, where food would be available to 'educate' the worms from say six hundred ounces of eggs, the quantity of leaves required would probably exceed forty-four tons.

In a succeeding and final article we shall wind up this important subject by endeavouring to show the position of the proposed enterprise, and the general lines upon which the industries in question have been projected.

## SKETCHES OF SCOTTISH LIFE AND CHARACTER.

### 'PUIR MISS FRENCH.'

MY earliest recollection of Poor, or *Puir* Miss French, as she was invariably designated in our Scottish village, is of a little old lady who had probably passed her sixtieth year; somewhat less robust and smaller of stature than most ladies of her own age; with features singularly delicate and expressive, and the most wistful, wonderful eyes that ever looked out of a human face. Her smile, on those rare occasions when she did smile, was unmatched for sweetness and 'attraction' by anything I had ever seen; and even to this day, when I meet in the course of my reading with any gentle female character which appeals strongly to my imagina-

tion, I may be able to array her at will in purple and fine linen, or add cubits to her stature, but her eyes and her smile are always the wistful eyes and the winning smile of *Puir* Miss French. Notwithstanding her years, however, the conversation and carriage of *Puir* Miss French were by no means those of an old woman; quite the contrary. No girl of twenty could carry herself with a more jaunty air, or exercise with greater assiduity those innocent little coquettish arts which sit so gracefully on the young and beautiful; but which, coming from the aged, are so apt to excite in the onlooker feelings of mingled pity and contempt. Her conversation had none of that staidness and gravity befitting her years, but was confined by preference to the young, and was invariably on subjects, and in a style, suited to her own inclinations and the years of her youthful auditors. It must not be imagined that her every-day dress at all corresponded with her youthful airs, for such was by no means the case.

With the exception of about two weeks in summer, when a light dress and abundance of white ribbons made the little lady a very conspicuous object in the village street, her ordinary apparel was of the soberest kind, almost invariably surmounted with the scarlet cloak and hood of her earlier years. Though living in a very humble way, and on an income so small as only to be slightly removed from poverty, her manners were those of a perfect lady, and that too of the old school. No contempt whatever mingled in the feeling with which she was regarded by her humble village neighbours; there was only pity—pity of the purest kind, crystallised to perfection in the name by which she was known far and wide—*Puir* Miss French.

Her father, the Rev. John French, A.M., had settled in the village as pastor of a denomination of Presbyterian worshippers termed Anti-Burgher, when his daughter Alison—the younger of his two children, a boy and a girl—was a little over ten years old. That he was a man who became very dear to his flock, and was altogether worthy of their esteem and affection, is to this day abundantly proved by the epitaph on the tomb-stone erected by them to his memory. At the time of which I write, this evidence could have been largely supplemented by the living testimony of many old inhabitants, who perfectly remembered the man, and who never failed, on due occasion given, to wax enthusiastic in their praises of his piety and fervour, as well as of his homeliness and genial human worth. His great learning and extensive reading are clearly to be traced in every line of numerous treatises which he left behind him in manuscript. These works, unfortunately, never found a publisher, probably because the good man had too carefully modelled his English style on that of the Scottish theological writers of the latter half of the seventeenth century—a style which has somehow dropped out of fashion; while those subjects which he treated in Latin had long since ceased to stir the national heart, or to affect in the slightest degree the opinions of the people.

A few years from the time when this estimable man settled in our village, and after due and careful preparation, his son John had been sent to Glasgow, to undergo a preliminary examination previous to entering the University of that city, and carried off triumphantly a handsome bursary. This help towards the young man's education was, I daresay, nearly as necessary as it was gratifying to the modest country minister. On his son's entry at college, his very respectable acquirements naturally recalled to the minds of his teachers the father who had been their own class-fellow; and arrangements were made whereby, at the end of the first session, a young gentleman of good family and means—Mr Arthur Young—was to accompany him to his village home, there to pursue his studies during the recess, under the guidance of the elder Mr French.

So far as can be ascertained, this Arthur Young seems to have been a young man of unimpeachable morals, of a modest and retiring nature, and of studious habits. His studies were not, however, like those of the younger French, pursued with any ultimate view to the ministry, or indeed to any particular profession. His researches in the classics were consequently not entered into with that young gentleman's feverish eagerness, nor continued with similar devotion, but were diversified by little excursions into various branches of natural science, more especially into the science of botany, of which he was an eager and intelligent student. In his wanderings after specimens, during the first two or three terms of his residence in the village, he was sometimes accompanied by the brother and sister; for he had contrived to inoculate both with a little of his own enthusiasm for his favourite science. By degrees, however, and as the time drew nearer to enter on those studies more especially connected with his future profession, John's botanical ardour considerably cooled, and the study was carried on by Arthur Young and Alison French only.

Thrown together in this way almost constantly during the last term of the young man's sojourn at the manse, with no one to observe or check the growing intimacy between them—for the minister's wife was a notable housewife, and took little interest in other than the merest kitchen duties; and the minister rarely left his study during the day, except to sally out on some pastoral visitation—nothing save the usual result was to be expected, and nothing else came to pass. Only after the young people had solemnly plighted their troth to each other, were Alison's father and mother made acquainted with the attachment which had sprang up between them. To do them justice, they threw no obstacles in the way of a union between Arthur and their daughter, rightly deeming her a fitting match for any untitled gentleman, and stipulated for no further delay than such as should enable Mr French to communicate with the young man's guardian. No objection having been raised in this quarter, it was arranged that Arthur should proceed to Glasgow for his last session at college, take his degree, and be married at the manse by his bride's father in the last week of the following June.

During this interval, our charming little Alison was supremely happy. Her lover's letters were long and frequent, and models of what a lover's letters ought to be—full of light and airy gossip;

but never forgetting, for the sake of matter or form, to throw in those delicate personal touches which go straight to the dear one's heart, and make all the difference between a genuine love-letter and a purely literary exercise. At the close of the session, and with his brand-new degree, he paid her a short visit, during which the arrangements for the forthcoming ceremony were completed; and when they parted, it was with all those tokens of mutual affection which have been current since the nature of things earthly have made lovers' partings necessary.

One short month would see our Alison's happiness complete. Her open and joyous nature took pleasure in showing to the young women of the village the various dresses and other articles which she was preparing against the great event of her life. It was observed that for two weeks previous to the happy day, she dressed herself as nearly in white as she could very well do, without drawing on herself any satirical or ill-natured remarks. While standing thus arrayed in the modest parlour of the manse on the eve of her wedding-day, and surrounded by her youthful companions, a letter from her affianced husband was put into her hands. It was very short, and said that circumstances over which he had no control whatever, compelled him to go abroad; that he begged wholly to relieve her from her engagement; hoped she might find a husband much more worthy than himself; and so bade her 'affectionately farewell.' Poor little Alison French read this terribly cruel letter steadily to the end, then, without outcry or alarm or speaking a single word, groped her way to her own room like one stricken with sudden blindness.

Her father's first impression seemed to be that this letter was merely the outcome of some horrible and fiendish practical joke; but while he counselled patience until it should be seen whether the bridegroom would make his appearance on the morrow, it was easy to see that the poor man had already lost faith in his own hastily formed opinion. The morrow came, however, and went; but no bridegroom came to claim the hand of pretty Alison French, who was now mercifully unconscious of the great wrong of which she was the victim, and was babbling of her lost lover in the delirium of a fever, which brought her to the very brink of the grave.

Meanwhile, steps were taken to find, if possible, the man who had thus made shipwreck of her young life, and to hear what explanation he had to offer of his otherwise inexplicable and altogether shameful conduct. His guardian, in reply to inquiries addressed to him, made answer, that Mr Young was no longer in any sense under his control; that he had delivered up his trust some months previous to the date of this communication; that since that time he had heard nothing of the young man's movements, and was entirely ignorant of his present whereabouts. He added that, sympathising deeply with the young lady and her family, he had written to Mr Young's bankers, who had at once informed him that that gentleman had severed his connection with them as soon as they were able, after he became his own master, to arrange his affairs and close his account. And this was all. Arthur Young was as completely lost to Alison French as if he had plunged into the middle of the sea.

After many weeks, and a severe struggle between life and death for the mastery, Alison was strong enough to leave her room; but so changed was she—changed in mind and body, that she was no longer that Alison French whom we had hitherto known. Instead of filling, as was her wont, the gray old manse with bursts of joyous song, with pleasant, hearty laughter, and with a general air of summer sunshine, she now wandered about the house and garden in a vacant, listless way, very pitiful to see. She spoke to no one unless directly addressed, when she answered in monosyllables; and never referred in the most remote way to the tragic episode through which she had so recently passed. Nothing appeared now to possess the slightest interest for her—even those pursuits, botanical and other, which formerly gave her the keenest pleasure, were so wholly neglected, it seemed as if they had faded utterly from her memory. But when the month of June again came round, she roused herself somewhat from her apathy, and for two weeks before the anniversary of the day which should have seen her married, she appeared dressed in white, a style to which she adhered until the fatal day was past, when she reverted to her usual sober habit. This practice she continued till her death.

Years rolled on, and Alison was left alone with her father, her mother having died, and her brother 'placed' at what was, in those days of imperfect communication, a great distance from our village. Although still comparatively vigorous, the venerable minister was beginning to show unmistakable symptoms of decay. His daughter's taciturnity had in a great measure worn off, and although she never laughed, and very rarely even smiled in the presence of strangers, she had always a ready smile for him. Their mutual affection was deep and tender, and yet he never seemed to observe what was sufficiently patent to every one else in the village: that his daughter's mental growth had been arrested by her great misfortune, and that although in years she was now a middle-aged woman, she was mentally no older than she had been twenty years before.

Such was the state of things in the quiet village manse, when, on a summer Sunday morning, just after Alison had laid aside her bridal finery for the season, her father was preparing for the usual pulpit ministrations of the day. His manner was more than usually solemn; for, although a man of sincere and unaffected piety, his disposition was cheerful and his enjoyment of life perfectly natural and healthy. 'Ailsie, dearie,' he said, 'I'm not altogether myself this morning. I think I'll tak a cup o' tea, wi' just a thimblefu' o' spirits in 't.' Many stories were afterwards current of the old minister's demeanour and little traits of kindness and consideration, as he passed through the kirk-yard on that sunny summer morning. How he had greeted with even more than his wonted cordiality every individual or group as he passed; how little Johnnies had got kindly smiles, and little Jennies tender words, even more winning and impressive than usual, from the dear old minister; and what a look of uneasy wonderment was on his face as he looked round upon his congregation after entering the pulpit. All these things were often told and long remembered. The preliminaries of praise and prayer were gone through in the usual manner; but

when the minister rose to give out his text, it was evident to all that something unusual was about to happen. There was a certain vacancy upon his countenance which filled his hearers with an uneasy dread. He turned over the leaves of his Bible in a vain search for something he could not find, then slowly closed the book.

'My brethren,' he said, 'the hand of God is upon me this day. I came here prepared to expound to you, to the best of my ability, a portion of His holy Word, as was my duty and my pleasure; but I have forgotten that, and much, much besides. I can only remember now that this day thirty years ago, I ministered to you for the first time within these walls, as your chosen pastor. I think the end is *here*.'

Two of the elders went at once to assist him down the pulpit stairs. In little more than a week, he was laid to rest in a corner of the quiet village kirkyard; and from that time, his dear, helpless daughter Alison, to the sorrowing villagers became Puir Miss French.

A Scottish country minister was rarely in those days, any more than at present, a man encumbered with wealth. When the little which the Rev. John French had left behind him was realised, there was found to be enough to secure for his daughter such an annuity as would enable her, with great economy and in a quiet way, to live beyond the reach of actual want. Her brother, who claimed for his own share nothing save his father's manuscripts, offered her a home with himself; but this she declined, preferring to remain in the village, which she had not once left since her arrival, a bright-eyed, laughing child, thirty years before. A room was accordingly secured for her; and here, for twenty years longer, her life flowed calmly onward day after day with little of outward change. It is true that for some years after her father's death, Puir Miss French was in the habit, during her 'weddin' weeks,' as they came to be called, of sitting in a ghostly way, at midnight, around the kirkyard and the manse. But this habit died away; and with the exception of a few belated rustics who mistook her for some unearthly visitant, and were terror-stricken accordingly, neither herself nor any one else seems to have come to any harm by it. About the time, however, at which we have now arrived—which is indicated at the beginning of this sketch—a visitor dropped into our village who was destined to exercise a considerable influence over her, and to disturb very materially 'the even tenor of her way.'

Mr Andrew Hepburn arrived in our village, according to his own showing, in search of rest and quiet, after the cares of an unusually busy and active life. Had his business and activity been devoted wholly to the search for a place in which to enjoy these blessings, he could not have been more successful, or have found a spot more likely to secure them in fullest measure. Our village had doubtless its hopes and fears, its joys and cares, its sins and sorrows—all the passions, indeed, of poor humanity, as other villages have; but with us they seemed to be mainly of the subdued kind, life chiefly consisting in getting up, killing the day, and going to bed again. So thoroughly did Mr Hepburn realise the fact of his having dropped into a genuine Scottish Sleepy

Hollow, that he had the very best rooms in the place fitted out afresh for himself—to the intense surprise of the village, which thought Mrs Watson's rooms 'gude enuch for a lord'—and sat down, as he himself said, for quite a long stay. He was a man, judging from his perfectly white hair and beard, and deeply furrowed features, not less than sixty-five years old, although his keen eye and light step would almost plead for some abatement. His height was certainly not less than six feet; while his firm and upright carriage spoke of no immediate pressing necessity for that rest, to secure which was the ostensible object of his coming to this old-fashioned, out-of-the-way village. His knowledge was extensive enough to astonish even the 'dominie,' who gave it as his opinion that 'Maister Hepburn was certainly a college-bred man;' while his manner with the old was so free and sympathetic, and his distribution of small coin among the young so judicious—not to say liberal—that in a marvellously short space of time he became an established and general favourite.

Ridiculous as it may appear, it soon became evident, even to 'Patie the fool,' that Puir Miss French was smitten with the charms of our too fascinating visitor. Seldom a day passed that she did not contrive to meet him on the most frequented part of our single street, where the formal and elaborate courtesy with which they greeted each other, was a sight not soon to be forgotten. Puir Miss French's youthful airs were in themselves sad enough, when contrasted with her aged appearance; but to hear her girlish giggle, unaccompanied by the faintest suspicion of laughter, was inexpressibly pathetic, and seemed to impress Mr Hepburn with feelings of profound melancholy. But when a day came that he met her somewhat suddenly, tricked out in all her faded bridal array, it was something deeper than melancholy, it was absolute horror that was depicted on his face; and though he contrived to go through the customary ceremony, his subsequent usual walk was abandoned for that day; while the village street knew him no more, until the hapless maid had returned to her every-day and less conspicuous apparel.

For the first few days of Mr Hepburn's seclusion, Puir Miss French wandered about in a very love-lorn and disconsolate way. No thought seemed ever to have entered her mind that her unusual style of dress could have in any way contributed to that gentleman's temporary seclusion, or who knows what effect it might have had on her strange and long established custom? As it was, she sought distraction on the green.

The village green was—and is—divided, in a very irregular way, into two unequal portions by the nameless rill or *burn* which runs through it. The larger had been consecrated from time immemorial, and by the unwritten law of custom, to such sports and pastimes as were cultivated by the village youth of Scotland. The younger generation engaged here, during a large portion of the year, in the games of Hide and Seek, Smuggle the Keg, Hare and Hounds, Steal the Colours, and, when a sufficient contingent of the softer sex would wander round from the village street, even that venerable and amusing pastime Bab-at-the-Bowster. Young men met here on summer evenings to compete in such exercises as putting the

stone, throwing the hammer, tossing the caber, quoiting, &c.; and though the scenes on 'this side the burn' were often extremely animated—not to say boisterous—they offered very little temptation to Puir Miss French. The 'wee green,' on the other hand, was strictly reserved from any inroad of boy or youth. Here almost every day, and well on into the night, during the summer months, was carried on that most animated and picturesque species of female labour, the domestic clothes-washing as practised in the country. Here it was that Puir Miss French sought and, in a great measure, found consolation. Amid the gossip and the jokes and laughter of the young women as they stood in their tubs 'trampin' the claes,' she seemed to forget her sorrow, and enjoyed herself, in her quiet way, almost as much as if Mr Hepburn had never crossed her path. Her 'weddin' weeks' were past, and she had returned to her usual plain and unobtrusive dress; but yet that gentleman had not resumed his daily promenades on the village street, although he now took long walks in other directions, making his way out and in by the garden, a gate from which opened on to the 'big green.'

The sports on the 'big green' were going on with great vigour, and the washing on the 'wee green' with shrill mirth, when Mr Hepburn one evening made his appearance, returning from his walk, and quite unconscious of coming evil. Puir Miss French could not for some seconds believe her eyes; but when convinced that he was really before her, she gathered up her skirts, and made with all haste for the stepping-stones by which the burn was crossed. The gentleman's way took him by the water's edge, and when he reached the stepping-stones, the lady was endeavouring to steady herself in the middle of the stream. To offer assistance was no more than the duty of any gentleman; and Mr Hepburn's offer was prompt.

'If you will take my hand, Miss French,' he said, placing his foot on one of the stepping-stones, and reaching out towards her. But by this time she had succeeded in recovering her balance. Instead of at once accepting the proffered aid, she brought her closed hands up to a level with her breast, twirled them round and round each other, saying slowly and with perfect gravity:

Nievy, nievy, nick-naek,  
Which hand will ye tak?  
Tak the right, tak the wrang,  
I'll beguile ye, if I can.

The situation was intensely droll; but strange to say, Mr Hepburn, although a man by no means deficient in humour, did not seem to see it. Not so the onlookers, male and female, who not only took in the comic features of the scene at a glance, but testified their appreciation of them by bursts of merriment loud and hearty enough to have satisfied the longings of a wilderness of low-comedians. When the lady did at length condescend to take his hand, and found herself at his side, she was by no means inclined to relinquish the advantage she had obtained. On the contrary, she clung to him tenaciously, and would lay her head on his breast, as if overpowered by the suddenness of her escape from some grave disaster.

'The auld sinner!' came a voice from a washing-

tub, 'is he actually gaun to rin awa' wi' Puir Miss French?'

This was more than Mr Hepburn could stand; so, with the perspiration dropping from his forehead, and the jeers of his tormentors ringing in his ears, he fairly broke away, to hide his shame and mortification in the privacy of his own rooms.

This episode seemed in some mysterious way to have wrought a great change in the relations between Mr Hepburn and Miss French. Next day, the gentleman appeared on the street as formerly; but those who expected to see the grave, formal salutation, were grievously disappointed. The lady failed to make her appearance. From this time, instead of seeking his presence, she seemed anxious to avoid him, and although, when chance threw them in each other's way, their greeting was as formally courteous as ever, no one could fail to see the pain it inflicted on Puir Miss French. When her 'weddin' weeks' came round, Mr Hepburn kept his rooms, although he had always some more or less valid excuse for this course, quite apart from the colour of that lady's garments; while she herself, instead of parading them as formerly, never ventured out in the daytime, except to do those little pieces of business that could not very well be left undone.

Things went on in this way for some years, until it began to be bruited abroad that Mr Hepburn was seriously ill. And seriously ill he undoubtedly was—so ill, indeed, that the old doctor had considered it his duty to warn him of his approaching end. Mr Hepburn expressed by word or sign neither surprise nor alarm, but seemed perfectly reconciled to his fate, and desired that some one should be sent for the hapless heroine of this story. It was the anniversary of her marriage-day that should have been; and when the message was brought to her, she trembled so violently, that she would have been quite unable either to have made the necessary additions to her dress or to have walked to his bedside without the assistance of the messenger.

'At last,' she murmured—'at last—at last!' And when she came to his room, whence all had been previously excluded, she entered, saying to the dying man: 'I have come—at last.' This was all that was ever heard of what passed at that interview. After some time, the poor creature came out and passed to her home, leaving Mr Hepburn's nurses to their duty. He died on that same night; and was buried, a few days afterwards, beside the grave of the Rev. Mr French. By his will, his property, burdened with a respectable annuity to Miss Alison French, passed to a distant relative. The name graven on the tombstone erected to his memory was—

ARTHUR YOUNG.

Alison French lived for a few years longer, the change in her circumstances making very little change in her habits and ways of life. Her 'weddin' weeks' were henceforth spent mostly in the kirkyard, where she trimmed with loving hands, and kept in neatest order, her two graves. When she died, it was discovered that she had saved enough to enable her to bequeath a considerable sum to the kirk-session. A portion of the interest accruing from the investment of this sum was to be distributed in charitable gifts; the remainder was to be paid to a poor man of the

village, for keeping in order three graves, on one of which was to be placed a simple stone, with only this inscription—

PUIR MISS FRENCH.

### A NATURAL CURE, AND WHAT CAME OF IT.

THE London season of 1880 was drawing to a close. The trees in the Park were beginning to look yellow and dusty; the *beau-monde* more languid and tired than usual; the drive was less crowded; cabs were conveying innumerable pieces of luggage to the station—all signs of the coming exodus.

It was high time to make up one's mind where to go for the summer. Fashion and one's own tired-out frame oblige one to go somewhere. I felt I needed not only fresh air, but a regular treatment, if I wanted to return to town in September able to resume my professional duties. I never was a strong man; but now, after a most unusual ordeal of late suppers, heavy dinner-parties, and social gaslight, I became aware that my health was going fast. But—where was I to go? Dreadful question, most difficult to answer. I have a horror of English sea-side places; it makes me yawn when I think of them—sand and children wherever you go.—To an English water-cure establishment? I had no intention to be killed or to be made lunatic. I once tried one of them, and I did not feel inclined to repeat the experiment. My friends suggested: 'Why not ask your physician?'—Ah, why? Because I do not believe in doctors and physic. I have detected them wofully in the wrong too often.

Have you ever felt the torment of not being able to make up your mind? Then you will pity me. One day, in the Club, in want of some better occupation, I looked at some obscure newspaper, and found the following advertisement: 'Waldesheim, near Düsseldorf, Germany—establishment for Curing by Natural Means—namely, Air, Water, Diet, and Exercise.—Prospectus, &c.' The brevity pleased me, and especially the 'natural means.' It was a comfort to know you would not be expected to swallow mercury, arsenic, strychnine, and other most objectionable poisons, with an amiable face and perfect confidence. I determined to write for fuller information. This turned out most satisfactory. Waldesheim was situated about an hour's distance from Düsseldorf, on the borders of a pine-forest that covered miles and miles of ground. The terms were moderate—from five to nine marks (shillings) a day, and no extras for the treatment.

My arrangements were soon made; and after a most pleasant journey, I arrived at Waldesheim, very curious to make the acquaintance of the place and the 'natural means.' A venerable old lady, with white hair and a ruddy complexion, received me. I understood that she and her brother are the proprietors of the *Kuranstalt* (curing-establishment). The house itself made the most favourable impression on me; it was simple, but comfortable and well kept. It was nearly seven o'clock P.M.; the patients were at their evening meal, and I was invited to join them. I had no objection to this; for I had an excellent appetite after my travels. By a neat waiting-maid, I was ushered

into the pretty, airy dining-room, which opened out on a garden-terrace. But imagine my feelings on beholding the scene before me! A narrow table stretched the whole length of the room; around it sat many ladies and gentlemen, most cheerfully partaking of milk, a kind of whole-meal bread, and raw or stewed fruit! It was one of the most dreadful moments of my life! I believe I should have turned into a statue with amazement, had not Miss Fellingner, the proprietress, advanced towards me and led me to the seat on her right hand. I felt I had been rash in coming to this place. My heart yearned for my excellent London dinners—for *potages*, *entrées*, and *rôts*. But it was necessary to make the best of the situation, and I began to take my sumptuous repast with as good a grace as I could muster. Strange to say, I did not find it so bad after all. I suppose the novelty seasoned it. The milk was excellent, the bread too, and the fruit delicious. When I had finished, I had to own to myself that I had seldom taken a meal with more relish.

Most of the guests were Germans. There were a few English, two or three French, and some Dutch. Miss Fellingner introduced me to the doctor and to some of the patients. Many of them were very ill indeed; they had come to Waldesheim as a last resource, after having swallowed a small druggist's shop without being cured. They were all fully satisfied with the progress in health they had made since they came to the *Kuranstalt*. Everything I heard interested me so much, that my resolve to quit this house of Spartan diet immediately, became shaken; and when I was shown to my bedroom at nine o'clock, I had made up my mind to stay for a week, in order to get an idea of the system. The windows of my apartment were only a few yards distant from a lovely pine-forest; the evening air was deliciously scented, and refreshed my spirits. I had been told it was the rule in the establishment to sleep with the window more or less open, and as I wanted to try the natural means in all their strictness, I conformed to the foregoing regulation.

At six o'clock A.M. the *Badeleiner* (bathing-servant) knocked at my door and inquired whether I wanted a bath. I felt so fresh and invigorated, that in spite of the unearthly hour, I consented. I was led down-stairs, where I found the most complete system of all kinds of baths that I had ever seen. As the doctor had not yet prescribed for me, I took a simple bath à l'Anglaise—only, to my great astonishment, nearly tepid. When I expressed my surprise to the *Badeleiner*, he replied that it was according to the doctor's orders; that cold water was so injurious to the health that it wore out the constitution. When I was ready, I was told to go directly for a walk in the pine-forest, and not to return before eight o'clock, when breakfast would be served. I had made up my mind to implicit obedience, and so I went in spite of the rain. On the way, I fell in with some of the patients I had talked to the night before. We went on together, and they showed me the sights of the place, when, to my great astonishment, we met a couple of patients barefooted and bareheaded. 'Wonders never seem to cease in this place,' said I to my companions. They laughed. 'You will get accustomed to that in time, and do it your-

self, if the doctor orders it.' 'Never!' said I, and shuddered. 'These gentlemen,' they mildly replied, 'suffer from congestion to the head or from cold feet, and there is no such efficient cure for this as walking barefooted and bareheaded.'

At eight o'clock, there was breakfast, and I returned with such a healthy appetite, that my frugal repast of milk, bread, and fruit seemed more delicious than the most dainty London meal had ever done. Miss and Mr Fellingner were most kind; they begged me to mention anything I should like to have; they would fulfil my wishes to the best of their ability.

After breakfast, the doctor paid me his professional visit. His orders adhered strictly to natural means—baths and other water appliances most minutely and elaborately prescribed, a great deal of exercise, and very strict diet. In three or four days, I was to leave off taking butcher-meat; no alcohol of any description, no tea, no coffee, no spices. In fact, to my idea—no anything. My obedience to the natural system was put to a severe test. No meat, no alcohol! It was terrible. And where then was the strength to come from to sustain me during this ordeal? Dire phantoms of my own self, emaciated and pale, rose before my terrified soul. I debated as to what I was to do. My first impulse was to fly from this starvation; but my curiosity stopped me. It would be interesting to see the results of this unheard-of cure. I felt I must be strong-minded, and give it a fair chance.

This resolution once taken, I underwent like a lamb all that I was ordered to do. I must confess I was sometimes highly amused, when I compared my London existence with my present life, and the extraordinary situations it involved. Can you picture to yourself a fashionable barrister in the undignified position of a wet pack? I was grateful that my friends were not there to see the spectacle. I will confess the worst: I walked barefooted, and I even liked it. My diet became in time equally rigorous. Milk, brown bread, and fruit, for breakfast; potatoes, vegetables, milk-pudding, and fruit for dinner; milk, bread, and fruit for supper. That was all.

Time wore on, and I remembered one day that I had already been for a whole week at Waldesheim, and that my first resolve had been not to stay longer. However, I did not feel inclined to go just yet. I felt better than I had done for many years. I had become attached to the place, to the natural means and my food, which, seasoned with a healthy appetite, seemed delicious. I thought it wise to give the Waldesheim system a longer chance. So I remained. Time went quickly. The days seemed to fly. The cure and open-air exercise kept the patients busy the whole day long. Besides, the social life of the establishment was very pleasant. Excursions into the woods were planned and pleasantly executed; in the evenings we had singing and music, sometimes dancing. Düsseldorf is within walking distance, and the Great Industrial Exhibition and the exhibitions of paintings in the town amused us on the rainy afternoons.

I began to love the place and its simple ways. Out of a weak, weary, dyspeptic, gouty man, I was fast growing into a strong, healthy one, full of spirits and energy. By degrees I also felt a mental regeneration. I saw before me most

palpably demonstrated the fallacy of the argument that meat and alcohol give strength. I had felt the virtue of a simple vegetarian diet. A few days before me, a German Lieutenant had come to Waldesheim so crippled by rheumatism that he could not take a step; he had to be carried about. He was now, after five weeks' stay, able to walk alone. I should hardly have believed such a cure possible, had I not seen it with my own eyes. This man, since the Franco-Prussian war, had tried one great medical authority after another. No one had helped him; he had only grown worse; and now he was on the high-road to recovery. I have heard since then that he is now quite restored to health.

Five weeks had elapsed since I had come to the *Kuranstalt*, when I received a telegram from an old friend: 'Join me at Cologne, Hôtel du Nord, &c.' I went, as Cologne is reached in an hour's time from Düsseldorf. My friend was more than astonished. He could hardly believe it was myself, when I shook hands with him, I looked so much stronger and younger. Jack was going to make the Rhine tour, and to take his sister, Mrs L—, a young widow, to Schwalbach, to drink the waters, as she was weak and ailing.

So we agreed to take one of the large Rhine steamers the following morning at nine o'clock, and go down as far as Eltville, the station for Schwalbach. The weather was glorious. We glided up the majestic river, and admired the Drachenfels, Rolandseck, the Loreley, and all the other lovely and poetic places that adorn the banks of the Rhine. I had often seen these sights before, but I had never enjoyed them as I did now. I began to feel the truth of the assertion, 'Health is the true key to happiness.' Never had Nature seemed so beautiful to me; never had I taken such interest in the scene around me. Who has not at least once witnessed the life on these Rhine steamers? Tourists of all nationalities enliven the deck in ever-varying groups; so we beguiled the time by looking on and by pleasant conversation. My friends wanted to know at which spring of health and youth I had been drinking. I gratified their curiosity, and gave them a true picture of my Waldesheim experience. I told them that water, exercise, and vegetarian diet, had made me a new man. My enthusiasm was infectious. The curiosity of my friends was raised, and they determined to go and see my vegetarian Eldorado. I persuaded Mrs L— to give up her intended Schwalbach cure, and to try the natural one.

We travelled on as far as Mayence; and then we returned, enjoying all the lovely sights thoroughly; for the weather favoured us. At each place of interest, we left the boat and stayed there for a day or two. We rambled all over the country, my friends riding, I walking. I remained true to the Waldesheim principles. My daily fare was fruit, milk, and bread, to the never-ending wonder and amazement of waiters and travellers. I should have been very sensitive to that a year ago—I bore it now with perfect equanimity.

After a fortnight's absence, I returned to Waldesheim, accompanied by my friends. They soon fell into the ways of the place; and it was not long before they felt the same wonderful benefit from the treatment as I had done. We enjoyed

the lovely woods, the splendid country, and our simple life, until the autumn tints reminded us that work had to begin again. We were sorry to part from our dear Waldesheim—Mrs L— and I especially, as the place had now more than ordinary associations of happiness for us.

I returned to London, determined to remain true to the new ideas I had gathered—namely, that simple diet is the best *healer* that Nature has given us.

My friends shake their heads in disapproval, and prophesy speedy ruin to my constitution. I bear that wonderfully well, as I feel my physical and moral strength growing daily. One sweet face, however, always smiles approbation on me. Mrs L— has become my wife. We live in Hampstead. 'Waldesheim' is the name of our new abode. We called it so in gratitude to the place where we found health, happiness, and—each other.

### POSTAGE-STAMPS.

THE first steps recently taken towards carrying into effect the proposal of a unified stamp that shall be available either for prepaying letter-postage or for receipt purposes, have already been noticed in this *Journal* (No. 909); and it need only be added here that this new stamp will, probably, very shortly be brought into operation; so soon, indeed, as the existing stocks of postage and receipt stamps have been to some extent diminished. Meanwhile, however, ere the familiar face of the present penny postage-stamp passes away from us entirely, it may be of some interest to record the various purposes which this little token has so usefully served since the date of its introduction.

As the reader probably knows, considerable uncertainty exists as to who was the original inventor of the postage-stamp; but the problem is not one that need trouble us here, since it is sufficient for the purposes of this article to know that the general use of such stamps was introduced in 1840, when Rowland Hill very naturally availed himself of the idea in connection with postal reform. It is a curious fact, however, that the suggestion to use 'bits of paper large enough to bear the stamp, and covered at the back with a glutinous wash, which might, by applying a little moisture, be attached to the letter without a wafer,' was made in the first instance by Rowland Hill before the 'Commissioners for Post-office Inquiry,' in 1837, merely as a means of obviating a difficulty that had arisen with regard to the projected universal adoption of the plan of stamped covers for the prepayment of post-letters, it having been supposed that the use of the stamped covers would become very general. But contrary to all expectation, the public speedily took most kindly to the 'small stamped detached labels;' thus flatly contradicting the opinion which freely obtained in many quarters at that period, that such a practice would be 'inconvenient and foreign to the habits of Englishmen.' It is on record that in the first fifteen years after their introduction more

than three thousand million postage-stamps were produced in order to meet the general demand.

So obvious at the present time are the benefits afforded by the use of postage-stamps for post-letters, that it is difficult to credit all the objections which were at first raised against their adoption. Many of these were, however, so ludicrous that the task of meeting them was rendered comparatively easy. Thus, amongst nine classes of letters mentioned by the then Secretary to the Post-office as cases in which the proposed stamp would not be available, we find 'half-ounce letters weighing an ounce or above.' It was somewhat shrewdly admitted in reply to this by the late Sir Rowland Hill that 'letters exhibiting so remarkable a peculiarity might present difficulties with which he was not prepared to deal.' Notwithstanding, however, all that was said and written against postage-stamps, they rapidly acquired immense popularity, which is the more noteworthy, when it is borne in mind that in those early days of its existence the prepayment of post-letters was not compulsory.

Some idea of the number of postage-stamps used at the present time may be formed by the fact that 1,581,937,300 letters, &c. passed through the Post-office in 1879. It should, of course, be explained that in these figures are included 114,458,400 post-cards, which, however, may fairly be reckoned as stamps for our present purpose; moreover, it is to be remembered that a large percentage of the letters, packets, &c. which are annually posted have more than one stamp affixed to them, so that it is impossible to arrive at even an approximate estimate of the number of postage-stamps used for letter purposes in this country in a year.

Not long after the use of postage-stamps became general, their utility, as was natural enough, began to spread in other directions. Their convenience as a medium for remitting small sums of money was speedily perceived, and taken advantage of by the public; and for some time postage-stamps were freely made use of for this purpose, the various postmasters in the country generally accepting them, in consideration of a small discount. Especially was this the case as long as the money-order rates were high and letter registration dear; but when the former were reduced, the postal authorities, who never entirely approved of it, discouraged a practice which they considered created an opening for letter-stealing, and put additional temptation in the way of the letter-carrier. The reduction of the registration fee in 1878 still further lessened the necessity for using postage-stamps for remittances, although, however, they still continued to be largely employed in this respect. The newspapers teemed with advertisements offering all sorts of imaginable articles, remedies, and information generally, in return for a few postage-stamps. Even now, such announcements may be seen daily in the columns of the press,

although the necessity for remitting in postage-stamps was almost entirely removed by the institution of Mr Chetwynd's cheap postal-order system at the beginning of the present year. These orders, as has already been noted in these pages, will meet nearly all the small remittances that are usually made; but in the few exceptional cases which cannot be met by the existing classes of postal orders, postage-stamps come in very handily to make up the required amount. "In such cases, it is right to add, only a few stamps require to be inclosed; which is a very different matter from sending in a letter some five, ten, or twenty shillings-worth, as used so frequently to be the case, and which could be readily detected by any would-be thief through whose hands they might pass.

When, in 1870, the electric wires of the country passed into the hands of the government, it was, of course, the most natural thing in the world that the utility of the postage-stamp should be recognised as applicable to telegraphic messages. It was at once apparent that it would be the most ready and convenient means of prepaying telegrams, especially as no difficulty would arise in distinguishing between the two sources of revenue, because the stamps used for this purpose never passed out of the hands of the Post-office, but were returned in due course to the chief office, to be accounted for in the ordinary way. For six years, this practice remained successfully in force; but in 1876, for certain reasons, which it is not easy to assign here, it was discontinued, and a new and distinctive stamp was introduced for purely telegraphic purposes. We cannot doubt, however, that when the idea of a unified stamp is fully carried into effect, the principle thereof will also be extended to telegrams, and the old practice thus practically reverted to.

The important part now taken by postage-stamps in fostering and encouraging habits of thrift and providence amongst the poorer classes, must be fresh in the memory of the reader, having been recently fully dealt with in this *Journal* (No. 879). We need only say, therefore, in reference to this part of the subject, that the admirable idea broached and carried out by Mr Chetwynd, whereby the poor man can now, by means of the slips furnished gratuitously by the Post-office, save his pence until they amount to the minimum allowed to be deposited in the government Savings-banks, has proved as successful as was anticipated by its most sanguine advocates, and as, indeed, it well deserves to be. A fair idea of the number of individual postage-stamps that have been used in this laudable manner since the introduction of the plan, may be formed from the fact that up to the end of June as many as twelve million stamps had been received by the Post-office in this manner. There can be little doubt as to the possibility of usefully extending the principle of this idea to the present system of government life insurance and annuities; and we hope, as is indeed not improbable, that some steps may shortly be taken by the postal authorities in this direction.

As regards the unified stamp, the convenience

and advantages that will be derived therefrom, both to the public and to the government, are no doubt obvious. The fewer distinctive stamps in use, the greater is the convenience to the public; while there will be a positive gain to the government by the abolition of the present receipt-stamp. There can be no doubt at all that the legal requirement of affixing a stamp in the receipting of bills and accounts of two pounds and upwards has over and over again been evaded, owing to the trouble of procuring the necessary stamp. Now, however, no such excuse can hold good, since the postage-stamp is a commodity that is ever to hand; and it is this very universality that enhances its utility not only as regards its normal functions, but also in respect of the various other uses to which it has been put, more especially, perhaps, in the case of the Savings-bank scheme. For this reason, therefore, it is not desirable that a special distinctive stamp for savings-bank purposes should be introduced, as has been frequently suggested, particularly as the temptation said to be placed in the way of office-boys, &c. by the penny postage savings scheme has been shown by experience to be more fancied than real. There is but one difficulty that has presented itself in connection with the plan for a unified stamp, namely, the question of distinguishing the two classes of revenue under the head of postage and receipt stamps. This is, however, to be overcome by an approximate computation of the annual revenue derived from the latter source, and, together with the allowance of an approximate annual increase, deducting the total sum annually from the gross revenue earned by the sale of the unified stamp, the resulting balance to be considered as postal profits. It cannot, of course, be said that this is a very satisfactory method of arriving at the yearly revenue derived from any particular source, yet it is perhaps well to forego any objection on this score, since no other feasible method has presented itself, and more especially—which is probably of most weight—as the method in question is amply justified by the immense amount of convenience which it will afford to the public, as well as in the saving which it will effect in the working expenses to the government.

#### AN ELECTRICAL SPEECH-RECORDER.

A curious instrument, which, if it never come into very general use, exhibits much ingenuity, has been devised by M. Amadeo Gentilli, of Leipzig, for the purpose of giving an intelligible record of speech. The natural movements of the mouth in speaking are employed to produce through delicate levers a series of electric contacts, and thereby sundry combinations of signs are imprinted on a moving band of paper, the signs being similar to those of the Morse alphabet. The transmitting portion of the apparatus is based on a careful study of the motion of lips and tongue in speaking with an object held between the teeth. The working parts are mainly arranged on an ebonite plate, from one end of which projects a piece to be taken between the teeth, whereupon the mouth levers come into position. There are eight electromagnets in the receiver, each of which, when actuated by a current, causes a line to be formed on the paper. The instrument is deficient, how-

ever, in articulation, there being only one sign for such sets of letters as *g* and *k*, *d* and *t*, &c., in consequence of these being produced by similar movements of the vocal organs.

#### WHAT ARE THE STARS?

['Aunt Mary!' said a very little boy named Cecil W—, 'I think I know all about the stars now. They are the little windows to let the "golden streets" shine through! But I'm not so sure about the sun. Do you think God moves it up and down with a string, as I do my air-ball?']

THE little cheek is pressed to mine,  
The little arms my neck entwine,  
In hottest haste the questions flow;  
Haphazard answers—"Yes, or No!"  
For, far with fancy I had flown,  
Musing on questions of my own.

But suddenly some words arrest  
My wandering thoughts—for they are dressed  
In sense and feeling, such as we  
See oft displayed in infancy;  
As if to childhood it were given  
To get some nearer glimpse of heaven.

'I'm thinking of the stars and God;  
I'm thinking of the "bright abode,"  
The "golden streets" where angels wait;  
Bright spirits at the "golden gate;"  
And if you like, I'll tell to you  
Why I think stars come twinkling through!

'You say that heaven is always bright  
With "golden streets" and dazzling light.  
With glory which no words can teach,  
Or wildest flight of fancy reach!  
So now, I think, I have found out  
Why all the stars are spread about!

'While we are living here below,  
God wishes us to see and know  
A little of the glorious light;  
But not too much to blind our sight—  
"A tiny peep"—enough to show  
Clearly the way we are to go.

'For this he spread a curtain out,  
And here and there pierced holes about,  
Small windows, in the lovely blue,  
To let the "golden light" shine through;  
To show us what He has in store  
For those who reach the happy shore!

'To teach us of what transient worth  
Are all the passing things of earth;  
That beauty such as meets us here,  
Is nought to that which shall appear,  
When, back! God's hand the curtain holds,  
And all heaven's glorious light unfolds!

'I'm not so sure about the sun,  
Or how he round the sky doth run;  
Or how God makes him "rules obey"—  
To sleep by night, and wake by day!  
I wonder if the God of All  
Moves "with a string" the shining ball?'  
MARY HOLDEN.

## TO DO, OR NOT TO DO?

'If you want a thing well done, do it yourself,' is a saying so common that it has almost passed into a national proverb; but, as is the case with the generality of aphorisms, something may be advanced on the opposite side of the question. In this instance, the 'something' was said long ago by a very great man, and in a form as epigrammatic as the better known phrase. It is related of the first Duke of Wellington that he gave advice to a friend in the words: 'Never do anything yourself that you can get done for you.' In these days of high-pressure, people who are at all prominently before the world, or who have regular and important occupations, are often so overworked that they act perhaps involuntarily, or even unconsciously, on the system recommended by the Iron Duke.

The man who is any way a chief must have subordinates; and probably not only his permanent success in life, but his comfort and peace of mind, will largely depend on his skill in systematically apportioning the work to be performed by each assistant. At the same time, his rules must not be too rigid for individual character to have a little play. After all, provided the necessary work be really well done, it is wise not to meddle overmuch with the manner of doing it. No servant is absolute perfection all round; and there is seldom any real progress made without some compromises proving necessary.

No doubt there are people with such a high, and consequently false idea of human possibilities of perfection, that they are positively pained by every shortcoming in their surroundings which happens to jar on their peculiar tastes; and such people are very apt to act on the principle of doing for themselves what they want done well, regardless that their exertions may sometimes prove a terrible waste of power. For instance, the man of business may have a special 'fad' about the garden of his suburban residence. It may be quite true that certain shrubs would be planted more to his liking if he stayed half a day

at home, to delve with his own hands, if need be, or at anyrate to measure distances and superintend operations, than if he trusted to the skill of his jobbing gardener. But that is hardly a reason why he should neglect business, and perhaps leave a highly important communication to be responded to by a subordinate, while the letter, or the interview, the 'Yea' or the 'Nay' to be spoken or written, was precisely one of the things that required his personal attention.

Energetic characters are in their youth—and sometimes even through life—very apt to undertake more duties than they can properly and thoroughly perform. In the attempt to do everything well and by themselves, health too often breaks down, and warns them of the limitation of their powers. The wise are they who do not wait for any serious suffering, before taking those hints which Nature always kindly gives; and these people pull up in time, recognise the irresistible logic of facts, and establish a new system. In such circumstances, the first thing to be done is to determine what occupations can with the least inconvenience be delegated to others, and what are those which—it being imperative that they should be thoroughly well done in a certain special manner—must be done by one's self. Sometimes, seemingly trifling actions come under the latter category. A letter may be so important, that it is wise to post it with one's own hand at some particular office. And we can fancy a tender husband or father, however great or busy a man he might be, who would determine himself to administer the prescribed remedies to wife or child in the peril of great sickness, rather than trust the duty to any less interested attendant. The probability is that the very man who would act thus would not waste his powers in doing the hundred little things which no doubt he *could* do exceedingly well, but which could be done sufficiently well by subordinates.

It were about as wise to search for the philosopher's stone, as to expect to find that 'other self' we all are apt to crave for at times. If, as botanists say, no two leaves are precisely alike,

we may be very sure no two human beings are without their striking differences. The 'other self' who would do just as we would do under all possible circumstances, is not to be found; and as we have to confess the limitation of our powers, the only thing a very busy and wise man can do is to decide betimes what he must do himself, and what can be done for him by others. Thus we come to what in a civilised community must prevail—the division of labour.

All great commanders and leaders of men have been distinguished for the keen insight by which they knew how to select subordinates. 'I always sleep soundly when Stapleton Cotton is on guard,' the great Duke already quoted is reported to have said; and the little anecdote throws light upon both characters. Nevertheless, when the vigilant officer thus commended gave place to some one a little less efficient, we may be sure the Duke made the best of circumstances, and did not chafe, and purposely keep himself awake with distrust.

It is certainly a very good thing for any sort of chief to be able to execute the details of all he desires to be performed by others. Such power gives great weight to his authority, but is no reason that he should consume his energies in petty ways when they are required for more important matters; though the temptation is often great to take up a matter that drags, and get it out of hand one's self. In these days, when it is so common a thing for gently nurtured and highly educated women to become, partially at anyrate, the breadwinners of a family, it behoves them to study systematically that same principle of the division of labour. Women of the middle class have, in the ordinary course of their lives, so many more petty distractions than men, that when, without neglecting their domestic duties, they achieve anything like distinction in art or literature or any special industry, it may be conceded to them that they have orderly, well-balanced minds, and that it is by method and foresight that they get through their labours. A very clever woman could probably do a multitude of things she leaves to be accomplished by others, better than they are done for her; but she must often put up with the second-best doing, if she have paramount duties which claim her time—duties that cannot be delegated to any other, to be executed even in a second-best manner.

After all, when we say, 'If you want a thing well done, do it yourself,' do we not rather mean, 'If you want it done *your own way*, do it yourself?' Probably, it happens to all of us to be agreeably surprised by finding something we had fears about, executed admirably; so admirably, that we feel at once our own powers are excelled. Of course, if we are busy people, whose time is precious, we remember never to waste our powers on that particular occupation again, if we can help it. But the subject has endless bearings; and we can do little more than draw attention to it. It is true that

*Trifles make the sum of human things,*

though perhaps with some qualification. What is a trifle? That is the momentous question, not always very readily answered. Truly, the active and energetic would find the day too short for all they wish to do, were it half as long again; but as our

planet persists in revolving in twenty-four hours, and the years seem to pass by the more swiftly the longer we live, they who most wisely systematise and apportion their labours, are likely in the long-run to get the most good work done.

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER XXXVII.—THE ARCHERY MEETING.

'GOLD, gold!—No; Red!—Excuse me; it *was* Gold, really.—Red, I assure you, but only by a hair's-breadth. The umpire has just decided, and his verdict is, Red. Though it's a pity for our score, and Mrs Denshire shooting so beautifully too, to-day!'

The spot on the target in which the lady's arrow had imbedded itself might have been the chameleon of the poets, so many opinions were expressed by interested onlookers as to its precise colour. However, the sentence of an umpire can no more be disputed than can an Act of Parliament that has received the royal assent; and therefore the hit in question, which had at first been cheered as a 'Gold,' was officially written down in the inferior category of 'Red.' And it did seem to be a pity, in the sense that the famous Club in whose grounds the contest was waged found itself overmatched in the struggle, and depended very much on Mrs Denshire's bow. Archeresses, like cricketers and oarsmen, vary very much in their performances; and some of the fair champions of the Society, whose shooting on ordinary days seemed as unerring as Diana's own, had turned out provoking failures, just when a keen eye and a strong wrist were needed to sustain the honour of the Club. Mrs Denshire, at anyrate, kept cool, and scored steadily; while brilliant sister-members disappointed their friends by irritating nervousness and unaccountable misses. But the day, in spite of the copper-coloured masses of cloud that rolled lazily down before a hot breeze, was a fine one, and the spectators pleased and happy.

Bertram never exactly knew, afterwards, how it came about that he found himself at Miss Carrington's side, and at some distance from the tent beneath which the rest of the Weston party were seated. They were not alone, except as people occasionally feel themselves alone in a crowd, when that crowd is composed of strangers; and in this case, among the groups of well-dressed persons who were near them, no well-known face was to be seen. 'A pretty sight, is it not?' said Julia Carrington, in a quick, sharp tone, that contrasted with the commonplace remark. Bertram glanced at her with some surprise. She was looking down, and with the point of her lace-bordered parasol seemed to be stabbing at a daisy that nestled in the soft smooth turf of the velvet lawn.

'It is a pretty sight; and to me, in particular, something quite new,' answered Bertram, looking round at the company, the targets, the glancing arrows as they winged their way towards the mark, the white tents, and the flags drooping, like tangles of seaweed, from their poles. The music of the band rang cheerily out, and there was much good-natured applause and clapping of

gloved hands at every fresh success. 'I am afraid, though, that you are tired,' Bertram added, seeing that his beautiful companion did not look up. 'If we were to go back to the tent'—

'Never mind the tent! No; I am not tired,' said the girl, still with her eyes fixed on the grass. 'Mr Oakley, I have something to say to you, if I dare to say it.'

'If you dare, Miss Carrington?' exclaimed Bertram, doubting if he had heard aright.

'Yes, dare,' she repeated, in a voice that trembled, in spite of her efforts to be calm, and which was all the sweeter for its very tremulousness. 'You wonder to hear me speak of being afraid—I who am so proud—but what I fear is—can you guess it?—that by what I am about to say I should forfeit your good opinion, Mr Oakley.'

'I am sure, Miss Carrington, that that, at least, is impossible,' answered Bertram, with chivalrous heat. There had been many conversations, during the past weeks, between himself and the fair Julia, and he had been pleased—he would have been more than mortal, otherwise—and possibly flattered by the apparently unselfish interest which she took in his plans and occupations, his preferences and his wishes. She read the books he praised. She gave thought to the subjects he cared for. For his sake, she had bridled her domineering temper, and was milder and more tolerant than her guardian's family had ever known her.

'I think you have bewitched Julia,' one of the Weston girls had said, laughing, to Bertram, one day when the heiress was out of the room. 'She quotes what you say, and is getting to be quite tame and domestic.'

Then Julia looked up, her glorious beauty flashing upon him as when, in stormy weather, the sun smiles on us from behind the wrack of hurrying clouds. Her blushes, her agitation, became her well, and the very tears that glimmered in her dark eyes gave softness to their lustre. 'And yet I am afraid that it is true,' she murmured.

Bertram felt himself excessively embarrassed, and yet a sort of delicious languor stole over him as he looked. How very beautiful the girl—the enigma—was! It was a pleasant, puzzling moment. He said nothing. He was all eyes. A spell, as of some mighty magician's weaving, seemed to lie upon those two, on Bertram and Julia. He would not have cared, for his part, how long, by art magic, the spell should be prolonged, and he and she look into one another's eyes. His eyes expressed nothing, save wonder and an honest, if irrepressible admiration. In Julia's there was a strange, tender light, that glowed and trembled. He was sorry when the girl spoke, and broke the spell.

'Bertram'—she had never called him by that name before, but it dropped with a dainty shyness from her red lips—'Bertram, do you care for me, a little?'

Now, if Bertram Oakley had but been a prudent young man, like that young Mr Inkle of whom a short but touching history is preserved in the *Spectator* of the late Right Hon. Joseph Addison and the late Sir Richard Steele, he would have given their proper weight to Julia's thousands, and replied with sentimental appropriateness.

As it was, he merely stammered out, awkwardly enough, that he was proud of her friendship.

'It is more than friendship,' said Miss Carrington.

Bertram could almost hear the beating of her heart. His own beat fiercely fast. How could he misunderstand her, or affect to misunderstand her, now? Her beauty dazzled him, as she fixed her eyes on his, as the rattlesnake gazes, fixedly, on the bird that flutters, shrieking, down, down, in narrowing circles, towards the destroyer. She knew her power. She had a fierce desire to conquer and to win. And perhaps she might have won, had it not been that between him and her there floated, by an unconscious effort of the imagination, the sweet little angel face of Rose Denham, the golden hair that encircled that face as with a saintly aureole; and Julia's haughty beauty lost its most potent charm by the contrast.

'Is this generous? You know what I mean,' murmured Julia; and she put her daintily gloved hand on the young man's arm, and leaned on it lightly. She looked upon his face. 'You know what I mean?' she said again.

'I am afraid I do,' he said with a sigh.

Quick as thought, she struck in, anticipating his speech. 'Don't say it, don't say it!' she exclaimed, in a tone that throbbled and thrilled through the listener, as he heard it, it was so terribly sincere. 'I have flung conventionality behind me, and cannot brook it now, Bertram, from the lips of the man I have singled out of all the world. It is unmaidenly, wrong, mad, for me to speak as I do! Custom seals our lips, and compels us to be passive, and to be mute, and decorous, and to wait; and if we revolt against this tyranny of tradition, you think the worse of us, for all our gnerdon. Oh,' she continued, with a choking sob, 'it is hard, hard, to be a woman!'

Bertram felt exquisitely uncomfortable. He tried to console her; but it was a case in which only one sort of consolation could avail, and that he could not give. She grew impatient.

'A truce to platitudes,' said Miss Carrington, with somewhat of the hard imperious ring that was familiar to her voice. 'Let us talk of yourself, Bertram, rather than of me. You are young, and poor, and a genius—ambitious, as all clever men are. Now, I am rich. In a few months I shall be twenty-one, my own mistress, free to wed as I like. You know that gold is a power yet, in the world. Money can smooth the road to the success you aim at, can sweep away obstacles, bridge the way, save years of toil and pain. You would like to be in Parliament, with what noble projects and wishes I know well. Make me your wife if you will; and in two years' time at most—in less—you shall write M.P. after your name, if money and wit and work can lift a man above the heads of his fellows. And—and—you would have a true wife—a loyal slave—in me—glorying in your triumph, comforting in the hour of ill—I—I'—

Sobs choked her voice. She had spoken, for once, from her heart. She was, for the moment, quite sincere in her self-sacrifice and her self-abasement. Her humility, the bowing down of that proud head, touched the frank-hearted young man who heard her, and it was in a broken voice that Bertram Oakley made answer: 'Hush! dear,

generous Miss Carrington—your great, undeserved kindness for me—I never can forget it. I wish I had had a sister like you'—

She started, as though he had struck her. There was reproach in her dark eyes, lustrous through their tears, as they met his. The little hand on his arm quivered.

'If I have, ignorantly, led you to mistake the nature of my feelings, Miss Carrington'—he began.

But she interrupted him petulantly. 'Feelings—you have none!' she said bitterly—'no heart, no blood in your cold veins! You are a stock, a stone, a statue! I have humbled myself at your feet, as if I had knelt to you—and you—you spurn me!'

'I—Julia—I!' said Bertram, astonished.

'You—you—you!' returned the heiress, looking down, and stabbing at the daisy. She had snatched her hand from his arm by this time, and was nervously fretting the costly lace that edged her parasol into tatters. Then she again looked up. 'Do you say, No?' she asked.

'If it is—do I love you, in that way, then'—Bertram began.

Again she cut short the sentence. 'Enough! When you reckon up your friends, sir, and compute your enemies, count me among the latter.' And there was a menacing glitter in her angry eyes as she spoke.

'You have taught me a lesson; I shall not forget it,' she said savagely.—'Yes; I am tired. Take me to the tent. Take me back, to Mrs Weston. I will trouble you no more.' Nor would she listen to a word that he said. There was nothing for it but to obey.

But when Bertram had escorted his fair charge back to the tent and to the chair which Mrs Weston had kept vacant for her husband's whimsical ward, and had said a word or two, and rambled away again, his brain seemed to be on fire. Had he acted ill? Had he misled this proud, vindictive girl into believing that she had found in him an admirer who, because of the disparity of fortune and station, had not ventured to avow his sentiments; and was it his fault that Julia had transgressed the unwritten code of Society, and earned mortification—doubly bitter to one of so haughty a spirit—as her reward? And yet his conscience assured him that he had in no way trifled with the affections of Mr Weston's ward. Always, in their intercourse, he had been himself, the soul of manly simplicity, no coxcomb, no dangler, one who, if he pleased, did so unconsciously. It was a relief to him when, strolling round, he came upon Mr Denshire, who, with Rose and the children, was looking on at the contest of the day, which Bertram had almost forgotten.

'The South will have a sad beating, I fear,' said the mild ex-barrister. 'I am no great judge of archery matches; but I do care a little about this one, for my wife's sake. Harriet has done wonders; but she cannot be expected to win the game off her own bat—her own bow, I mean. And the weather looks uncertain.'

'We shall have a storm, I am afraid,' said Rose; and Bertram's eyes followed hers, and saw, what he had not previously noticed, that the rounded copper-tinted clouds which had floated down before the hot breeze, were thick packed, now, like hostile armies drawn up in battle-array, and

that the copper colour itself was changing fast to black, as though the sky's face wore a frown. The sultry wind itself died away, or blew in short-lived puffs that stirred the drooping flags, or fluttered the sailcloth of the white tents, and then was still again. The match went on, and the music of the band pealed forth on the summer air.

Bertram found it a pleasant diversion from his own thoughts, not just then over-agreeable, to listen to the innocent prattle of the children. Tiny Hughie and fairy Alice were honestly eager that 'Mamma'—who in their eyes represented all the torophilite skill and prowess of the South—should gain a victory over the rival archeresses of the North; and Rose, too, had learned to be a partisan of the local faction, and trembled as the odds against her friends' success increased. How good and pure and sweet the golden-haired girl looked as she stood there, with the children clinging to her; and what a contrast to Julia in the bloom of her dark, imperious beauty! It was like a fair white lily, or some coy violet, peeping forth from its leafy nest in spring-time, that delicate loveliness of the one, as compared with the proud splendour of the other.

As Bertram stood and talked with Rose, there was a low rumbling of distant thunder, and a general move among the more wary of the spectators ensued. Among these were the Westons, who presently passed, and, as they passed, lingered for a minute to shake hands with Mr Denshire and Rose and the children, all except Julia Carrington, who had resumed her coldest and haughtiest air, and with a disdainful toss of her head, and a sudden compression of the lips, swept past Bertram and Rose Denham as though she had been unaware of their presence.

'Julia is quite right. She is afraid her new Paris bonnet will be spoiled; and so it will, unless we are quick,' said good-natured Mrs Weston, as a lurid flash, followed by a threatening thunder-roll, gave token of the coming storm; and soon the first of the flat broad drops came pattering down. 'Where is Mrs Denshire?' she added. 'I hope you will all take shelter in our house, it is so near.'

Then the storm came on, as such summer storms do, and there was hurrying, and haste to get away ere dresses should be drenched and hats ruined; and horses stamped, and whips cracked, as carriages were brought up to the gates; and the irregular column of spectators poured out of the grounds in laughing or complaining groups, and the match was perforce left unfinished, under pressure of the elements. But Bertram could not be persuaded to accompany the party bound for Mrs Weston's house. He felt that Julia Carrington and himself were best apart.

(To be continued.)

## DREAMLAND AND SOMNAMBULISM.

On the subject of somnambulism, we have on various occasions offered remarks calculated to interest those who seek to understand the strikingly abnormal phases of mind that occasionally affect persons while partially asleep. The revelations of 'dreamland' are both numerous and prolific; but few of them can be said to convey intellectual and moral suggestions of the normal.

action of mind and life; though some of them may lay hold of the mind with a mental grip that cannot be easily relaxed.

The writer of this article has a brother-in-law who has felt some of his dreams to be of a remarkable and significant character; and his experience shows that there is a strange and inexplicable connection between such dreams and the state of somnambulism. Before giving in detail, therefore, some instances of somnambulism as exhibited by him and also by his daughter, I will give an account of one of his dreams, which has been four times repeated in its striking and salient points, at uncertain periods, during the past thirty years. He was in his active years a practical agriculturist, but now lives retired. All his life he has been spare of flesh, active, cheerful, and very companionable, and not in any sense what is called a bookworm. His dream was as follows. He found himself alone, standing in front of a monument of very solid masonry, looking vacantly at the north side of it, when, to his astonishment, the middle stones on the level of his sight gradually opened and slid down one upon another, until an opening was made large enough to hold a man. All of a sudden, a little man, dressed in black, with a large bald head, appeared inside the opening, seemingly fixed there by reason of his feet and legs being buried in the masonry. The expression of his face was mild and intelligent. They looked at each other for what seemed a long time without either of them attempting to speak, and all the while my brother's astonishment increased. At length, as the dreamer expressed himself, 'The little man in black with the bald head and serene countenance said: "Don't you know me? I am the man whom you murdered in an ante-natal state of existence; and I am waiting until you come, and shall wait without sleeping. There is no evidence of the foul deed in your state of human existence, so you need not trouble in your mortal life—shut me again in darkness."' "

The dreamer began, as he thought, to put the stones in their original position, remarking—as he expressed himself—to the little man: 'This is all a dream of yours, for there is no ante-natal state of existence.' The little man, who seemed to grow less and less, said: 'Cover me over, and begone.' At this the dreamer awoke.

Years passed away, and the dream was forgotten in the common acceptance of the term, when behold! without any previous thought of the matter, he dreamed that he was standing in the sunshine, facing an ancient garden-wall that belonged to a large unoccupied mansion, when the stones in front of him began to fall out with a gently sliding motion, and soon revealed the self-same mysterious person, and everything pertaining to him, including his verbal utterances as on the first occasion, though an uncertain number of years had passed. The same identical dream has since occurred twice at irregular periods; but there was no change in the facial appearance of the little man in black.

My brother-in-law was about twenty-three years of age when he first dreamed the above dream, and

was a single man living with his father, a farmer. The house was of a large straggling construction, some two hundred and fifty years old; and by the side of it was what was called the 'old house,' comprising a kitchen, dairy, coal and wood house, and several lumber-rooms above. He had a decided taste for drawing, and had several sketches in blacklead of horses, pigs, cows, and sheep, which he thought worthy of being put into frames. It so happened that in his bedroom there were hanging on the whitewashed walls six old engravings of Scripture subjects, designed some one hundred and fifty years before, which were almost totally obliterated by dust, mildew, and the operations of spiders and moths. They were all about twelve inches by fifteen in size, in old oak frames painted black; and oak back-boards were firmly nailed into each, to keep the engraving *in situ*. After mature thought, he decided to take the worthless engravings out of the frames, and put six of his drawings in their places. The engravings had been at some remote time thought worthy to be protected with glass.

One summer afternoon he took the engravings from the walls, and in the window-seat of his bedroom he began the operation of taking them out of the frames. He attempted with a claw-hammer to draw the old rusty nails out of the back; but with all his skill, he was unable to extract a single nail, so tightly were they fixed in the well-seasoned oak frames. He bethought himself of a pair of pincers which he knew he had; but he was unable to find them, though he searched till dark; so he gave up the project for that day, and again hung all the pictures in their original places. In the usual order of daily events, he took his supper, went to bed, and fell soundly asleep as usual.

The next morning, the early-rising sun darted his rays into the room, and he awoke. He felt that he had dreamed about the pictures, the frames and nails, as also of his failure to extract the latter; and glancing at the walls of the room, he found that they were all removed; and he was perfectly sure he had hung them up the previous evening. He was equally sure that nobody had been in his bedroom. In his surprise he got up, and to his astonishment found the six engravings and the glass of each, but without the frames, all standing against each other on the chair by his bedside, and not one of the glasses cracked! The six frames he also found placed in a similar manner in the window-seat, the rusty nails lying beside them. The whole thing was a mystery. After making inquiries, however, into the matter, he came to the conclusion that he himself had done the whole of the work while in a state of somnambulism. Nor was this all. The pincers, which the day before he had searched for in vain, and which he had dreamed were in a certain place in the lumber-room over the kitchen, which stood about five yards from the dwelling-house, were lying with the nails! But as the door of the kitchen and dairy was regularly locked every night, and the key hung up in the sitting-room, the somnambulist must have gone down a winding staircase, through two doorways, unlocked and unbolted the outer door, taken the key of the old house from the place where it was kept, then crossed the open yard, gone up a rickety staircase into the lumber-room, and found the pincers with

the help of which he accomplished the work. The only thing that betrayed any lapse of thought was that the old house-door was left wide open, to the surprise of the dairymaid whose duty it was to see it securely fastened. The persons sleeping in the house were his father and mother, two sisters, two maid-servants, and the carter; yet not one of them was conscious that any person had been moving during the night.

Somnambulism of this extreme character has since left him; yet something of the quality still shows itself occasionally in his getting out of bed, doing some trifling thing to his clothes, or dressing himself in an eccentric manner, and then getting into bed, to find the result in the morning. His only daughter, my niece, inherited this mental peculiarity of his, but with a difference. When she was about ten years of age, she was sent to a ladies' boarding-school, where it was noticed that while she was in the habit of neglecting her lessons at the usual time of preparation, she was always perfect in her tasks in the morning. This was ultimately explained by an accidental discovery that she used to walk in her sleep, going in her night-dress into the school-room, and sitting down to her books, and coming over her lessons for a greater or shorter time, according to the difficulty of the task. She would then go quietly back to bed without waking. The accuracy with which she said her lessons, when her governess knew from observation that she had not devoted any time to them, ultimately led to the suspicion that she walked in her sleep, and acquired them in a state of somnambulism. This was demonstrated to the satisfaction of the whole school, including the governess and mistress. It happened thus.

There was a music-master engaged, who had a pupil older than my niece by four years, but very far inferior in taste for music. The master had tried hard to make his pupil perfect in a certain new piece of music, but without success. At an evening's practice, my niece was in the room, and had paid particular attention to the master's instructions, though she had not attempted to play the air herself. After the lesson, the overture was put aside with the other pieces of music, and in ordinary course the young ladies retired to bed, and the governess and mistress followed. The whole house was under the balmy influence of gentle sleep, when one after another the inmates awoke under the thrilling tones of the piano, giving forth the air which the music-master had been vainly trying to impart to his inept pupil the previous afternoon. It turned out to be my niece, who was playing the air perfectly, with an execution said to be brilliant. She had a natural ear and faculty for music, so that there was nothing extraordinary in the mere playing. She was, in fact, a musical genius; and before she was twenty, had regularly played the organ at church, and did so with great ability. Still, on this occasion it is somewhat singular that though she had listened for only a short time to the air in question, she had found no difficulty, whilst under somnambulism, in giving a correct rendering to the piece. She would sometimes sit up in bed and hold an animated conversation with an ideal image of her mind, not always, but most frequently with her companions.

Closely allied to the phenomenon of somnam-

bulism is that of 'dual existence,' or, as it is sometimes called, 'double brains;' and on this subject the following reminiscences, communicated to us by a London physician, are of interest.

I am not clever enough to enter into any discussion respecting 'dual existence,' nor to give any explanation of the same; but if the expression mean to signify that persons sometimes in their sleep lead a different life from that which belongs to them when they are awake, I have no hesitation in saying that I firmly believe it. This peculiar mental condition, I take it, is wholly apart from ordinary sleep-walking, inasmuch as the actions of a somnambulist are to some extent allied to events which have occurred during wakeful hours. The late Alderman Kelly, who was Lord Mayor of London about the year 1836, was remarkable as a somnambulist in his younger days. He was a relative of mine; and I have heard many well-authenticated accounts of his doings whilst asleep. He was the shop-assistant of a large publisher in Paternoster Row—in which establishment he was later on the proprietor; where he made his money, and where he published the numerous works which bear his name. These publications include the several editions of the Bible, of which it is estimated that he sold nearly a hundred thousand copies of the large folio Brown's *Self-interpreting Family Bible*.

One instance of his somnambulism was this. A large order for various books (in numbers) had come in late one afternoon; and to insure delivery in time, it was necessary that early attention next morning should be given. As in the present day, so it was half a century ago with large books such as Brown's *Bible*, which were issued to the public in weekly instalments termed 'numbers,' and monthly instalments termed 'parts'—each with a wrapper, and its number in the series printed thereon. In those days the dwelling-houses of business-men were usually connected with their shops or warehouses; and when the business of the day was done, the merchant retired up-stairs to his family. On the occasion under notice, Kelly, who was an extremely anxious young man, always nervously fearful of not being able to accomplish his duty, retired to rest with the intention of rising very early next morning, so as to get the order selected and despatched. What was his surprise, on entering the shop, to find his task completed, the books all correctly collected in 'numbers,' and packed up ready for delivery! He had risen in the night, and without being at all conscious of his actions, had done his work as deftly and neatly as though he had been awake!

Now, to estimate the difficulty of this, I must explain that in the old shop in Paternoster Row, all the publications were in weekly numbers or monthly parts, and were arranged in shelves reaching from the ground nearly to the ceiling, not only around the walls, but in racks all over the place. The numbers, it will be understood, were not placed in sets—each set in a compartment of its own, but in continuous rows; so that in row A there might perhaps be Brown's *Bible*, numbers one to twenty; and whilst there were ten copies of number one, there might perhaps be thirty of number two, and perhaps only four of number three; and

so on: showing that there must be some intelligence at work—not mere mechanical habit—to enable the operator to select the numbers required. These sleep-walking acts of business were, I am told, always correctly performed; and on no occasion was a number known to be wrongly selected. This, then, is an illustration of ordinary sleep-walking or somnambulism; and, as I said before, is a continuance or completion of acts or events which have taken place whilst the sleeper was awake. But what I understand by the term ‘dual existence’ is a totally different affair. It is a series of actions which, taking place during sleep, are discontinued during waking hours, to be resumed when sleep again occurs. I have given an example of the former; I will now give one of the latter.

Called upon one night, in the pursuance of my professional duties, to visit a young lady in whose family a series of sad misfortunes had recently taken place, I found my patient in what is known as a cataleptic condition; or rather it would perhaps be better to describe it as one form of catalepsy, since, in some rare attacks of this curious affliction, the patient is suddenly seized, whatever he or she may be doing at the moment, and transfixed like a statue, firm and rigid, until the symptoms abate. In this case, however, I found Miss S— in bed, to all appearance lifeless. Pulsation could be detected with the greatest difficulty; and it was only by placing a small mirror over her mouth that breathing was apparent. The most singular feature of the attack was this, that in whatever position you placed a joint or limb—however inconvenient or impossible to sustain during consciousness—it remained there until you replaced it; just for all the world like the limbs of an artist's lay-figure. I remained by her bed-side until the morning, when the pulse began to be a little stronger and the breathing a little deeper. She then gave one or two profound sighs, and appeared to awake as if from an ordinary sleep, being quite unconscious of having been ill. This was the commencement of a series of phenomena which then took place. On the following night, she retired to rest as usual, and went to sleep; but after an hour or so, her sister—who slept in the same bed—saw her get up and dress. When asked what was the matter, Miss S— made no answer, but continued in the most mechanical manner to dress, as though she were getting up in the morning in the usual way. Her eyes were wide open, although she did not appear to use them. Thoroughly alarmed, her sister rose also, and sent for me.

When I arrived, Miss S— had completed dressing, and had descended to the drawing-room, where she proceeded to rearrange the furniture: placing a chair, for example, in the corner opposite to its accustomed place; putting some of the chimney ornaments on the cabinet, and after removing each, standing with a reflective air, as if considering whether the new position were advisable. All this was done by the aid of a small lamp—though light was evidently not necessary to her proceedings, since she moved with the most perfect ease amongst the many articles of fragile ware which usually adorn a drawing-room. I requested that she might not be disturbed, but stood by and watched her for more than two hours.

Amongst other articles of furniture in the room was a table, upon which stood Miss S—'s writing-desk. It stood in a corner away from the window. Taking the table and desk, Miss S— lifted it carefully, and placed it at the window, as if she wished to have all the light she could get. She then sat down in a chair, produced a bunch of keys from her pocket, selected the right one, opened the desk, and, having apparently looked for and found certain letters, appeared to read them. After a while, the letters were replaced, the desk locked; and as if tired with her work, she sat down in an armchair and apparently slept. Finding that she made no answer when spoken to, I carefully lifted her, and carried her up to bed.

Next morning, she awoke as usual; and beyond expressing surprise that ‘she had fallen asleep without undressing,’ knew nothing of the events of the preceding night. Of course, we kept our own counsel, and did not tell her. On entering the drawing-room next day, she observed that her desk and table had been removed, and expressed some considerable annoyance that any one should interfere with them, being evidently utterly unconscious that she had removed them herself.

On the following night, Miss S— rose from her sleep, as before, and went straight to the drawing-room. The furniture, at my request, had been left as she had arranged it, with the exception of the table and desk, which had been relegated to their proper corner. On entering the drawing-room, taking her keys out of her pocket as she went, she proceeded straight to the window where she had placed her desk on the preceding night; and not finding it there, seemed vexed, and stamped her foot. She soon, however, removed it from its place to the window; and sitting down, read, or appeared to read, her letters, until she sank to sleep as before, and was carried to bed.

This went on for some time. I carefully watched her; and my observations convinced me that her sleeping world was a distinct and separate world from her waking one. Under careful treatment and attention to her bodily health, these phenomena after a while ceased, and she was, to all appearance, in good health. Whilst fairly well, Miss S— had a paper sent her which was of considerable value. She placed it in her desk. Her sister saw her place it there. Shortly afterwards, having occasion to refer to this document, Miss S— went to her desk to look for it. It was not there! Every place in the house was fruitlessly searched. There were no signs of the missing paper. Happening to hear of the circumstance, and being aware that some events had occurred likely to worry such a sensitive mind as that of Miss S—, I advised that she should be watched at night. This was done. One night, after sleep, as formerly, Miss S— rose, dressed herself, entered the drawing-room, and without hesitation went to a large vase which was nearly filled with dried rose-leaves. Plunging her hand into this vase, she at once drew forth the lost paper! She then opened the paper, appeared to read it attentively, and then deliberately folding it up, replaced it amongst the rose-leaves. Here, the next morning, her sister, when they were together in the room, pretended to find it by accident, to

the great delight of Miss S.—, and to her intense surprise, how any one could have taken it from her desk and so hidden it, and why they did so.

Who shall explain these phenomena?

### A TALE OF THE YORKSHIRE WOLDS.

FIFTY years ago, the laws were not so thoroughly enforced as they are now upon the wild ranges of England called the Yorkshire Wolds. Few of the busy dwellers in populous London have any idea of their grandeur in a winter snowstorm, or of their beauty when an August sun pours down its rays upon stretches of waving corn, that lie like sheets of gold along the ridges, fringed above with dark plantations. During the Great Exhibition of 1851, a few friends and I took a real holiday for once in our lives, and went for a week to see the wonderful things in London which the papers were so full of. We saw all that could be seen in the time, and we did not lose a moment. I assure you. But after all, I saw nothing like our grand old hills. It was the first time that most of us had been so far away from home.

My tale!—O yes, that was what I started to tell you; but that was twenty-five years before our London visit, when I was a young man, farming a hundred and sixty acres of land. I had occupied the farm about two years, renting at the same time a house in the nearest village, two miles away, for my wife and two children. The farm-buildings consisted of a large barn, which went by the name of the Red Barn, it being built of red bricks; an old six-horse stable, thatched with whins; a fold-yard, paved around; and two or three wood-sheds. A good-sized house and better out-buildings were being built; but none of them was far enough advanced to be habitable for man or beast. A plantation of ash and spruce trees sheltered the farmstead from wind and storm, as it was situated high up on the hillside.

Returning home rather later than usual one Saturday night from our market-town, a distance of twelve miles, I was told by the man who came out to take my horse, that an accident had happened up at the farm that afternoon.

'What is the matter, David?' I asked.

'Roger has run a fork into his foot,' was the answer.

Roger was one of the horses. It appeared, on further questioning, that one of the large steel forks, used for stacking in harvest-time, had been carelessly laid upon the stable-floor, and Roger, a farm-horse, had run its prongs into his foot. The man thought that it was a serious wound.

'What have you done to it?' was my next question.

'Sent off for Coats.' Coats was the veterinary surgeon for the district.

'Has he come?'

'No, sir; he had gone to Melby.'

Melby, I knew, was eighteen miles away across country from Coats's home; and after that journey, he would not feel inclined, at eleven o'clock on a cold winter night, to start again for other sixteen miles.

Turning my horse's head, I told David to go to bed, and I would ride up to the Red Barn.

'Shall I sit up for your horse?' he asked, yawning, tired from a long day's exposure to cold and storm.

'No; no one need wait for me;' and I started off.

Fifteen minutes brought me to the stable-door; but I paused to let my heated mare drink from the pond close by, and as I stood I caught a murmur of human voices within the stable. Surprised, as not a man lived at the stead, I tried the door. It was fastened from the inside. I knocked, still holding my horse by her bridle, tho' thought coming across my mind, that Coats must have come straight here, without waiting for any one to assist him. There was no answer to my first summons; so I knocked and called again more loudly.

'What d'ye want?' demanded a gruff voice from the inside.

'Want? I want in, to be sure. What are you doing there, I should like to know! Open the door at once!'

'Likely!' was grunted back again, 'when we are just warm and settled after a nasty, cold tramp.'

Now I knew who my uninvited guests were. It is not every one who knows, or knew, of the existence of a class of mendicants, familiarly termed amongst us 'Wold Rangers,' a pest to the farmers, and a great dread to the inhabitants of outlying farms. They were constant pilferers; and rarely would work, though often applying for it. None of them was above poaching; and most of them had been in prison some time or another. A few professed to be hawkers of some sort; but the majority begged from door to door. We had no policeman nearer than ten miles, and his face was almost as strange as the Shah's in our district. These lawless wanderers rarely travelled alone, but were generally accompanied by a numerous following of women and children, a horse and cart or two, often a donkey, and two or three dogs.

My visitors were in no particular hurry to comply with my reiterated demand for admittance, and their loud snores were most irritating to hear from the outside. Again I vigorously pommelled the door with an ash sapling that I carried in my hand, and loudly stormed at their obstinacy. It was no use, as a growl was all the reply I got. As determined to be inside as they were to keep me out, I went back a few paces, then dashed open the door with my foot.

The moonlight just shone in with sufficient light to enable me to see what a strange lot of bedfellows were grouped together among the straw; and the loose horse-box was at the end of the stable, right through the thick of them. I ordered them one and all to 'turn out.' An Irishman who went by the nickname of 'Dead Ned,' lifted his fierce, shaggy face, and dared me, in strong language, to attempt to disturb them.

'But my horse,' I reasoned—'I must see to him.'

But reason was drowned in the opposition of a dozen hoarse voices.

I was young then, and reckless of danger; more so than I am now on the wrong side of sixty. Incensed, I drew back from the open door, slipped the bridle over my thoroughbred's neck, and struck her sharply across the flanks with the ash sapling. It was the work of an instant. She bounded into the stable-door; and no sooner were her hoofs heard on the threshold, than

every creature inside leaped up, the startled men, women, and children rushing out pell-mell.

I lost no time in striking a light after their quick exit, to see after the wounded animal, leaving the one I had ridden to follow her own devices, which she did by going outside again. The foot was in a serious state, and evidently painful.

'Coats will never come to-night,' I thought, 'and something must be done;' and to foment the swollen foot was the only thing that I could think of.

I went outside again, allowing the disturbed women and children to return to their straw; but requesting Dead Ned and some of the others to help me to heat some water. We drove three thick stakes into the bank, close beside the pond, crammed plenty of sticks under the iron pot, and soon had a blazing fire. When the water was hot enough for our purpose, we carried it into the stable, and fomented the wounded foot. The process eased the pain; and after half-an-hour's fomentation, I wrapped it up in cloths saturated with some healing oils which were kept in the stable. One of the men held the flickering candle, stuck on the top of a lantern; whilst other eight or ten more were grouped around, watching the proceedings, and giving occasional assistance. As I was bandaging the foot, I caught a motion or sign, not intended for me to see. It was a signal from Dead Ned—who, I perceived to my horror, held in his hand the heavy iron gavellock that we had used to hammer the stakes into the ground—to another of his fraternity. Like a flash it came over me, how could I have been so reckless, so foolhardy, as to trust myself alone, and unarmed, amongst this ruffianly crew?

I grew hot and cold by turns as I remembered that I carried in my breast-pocket one hundred and sixty pounds. It was a large sum, you think, for a farmer to have about him; but you see it was not my own. That year I held the office of Income-tax Collector; and I had taken the money with me to market to pay to the government Commissioners. I had made a mistake in the hour appointed, and was too late, for they had finished and were gone; consequently, I brought the money back, intending to forward it on Monday. The occurrence had passed out of my mind before reaching home; then David's news completely put everything else out of my head, until I caught that gleam of evil in Dead Ned's eye. It was not so much the physical harm I feared, as the idea that they would not be content with stunning or murdering me, but would rob the senseless body; and what would become of my wife and children, if my goods and chattels were sold to repay the lost government taxes? Why, they would be turned out into the wide world homeless and unprotected. The bare thought made me tremble. I must not let them suspect that I had seen their signals. Oh! the agony of that moment.

Making one venture for home, wife, and children, as well as life, I carelessly dropped the horse's foot, telling them, in a loud voice, to keep the candle still, until I fetched some more string; and walked out of the stable as deliberately as I possibly could. Once out, I looked for the bay mare that had carried me up. She was leisurely nibbling some short grass a few yards from the

door. 'Jess, Jess, good lass!' I cried, softly and very gently approaching her, as I knew that if she bolted, it was good-bye to life for me.

Fortunately, she allowed me to catch her, and not a moment too soon, for my unwelcome visitors had followed me, and a glance at their low, villainous faces, as I dashed off, proved that they were full of rage at thus being baffled. The village church clock struck one as I entered my home in safety.

I paid a second visit next morning at four to the wounded animal, but leaving my pocket-book at home this time, and going neither alone nor unarmed. The birds, however, had flown. If the ashes of the stick-fire, and the bandages on the wounded horse, had not borne me witness, I should have been inclined to fancy that last night's narrow escape was nothing more than a disturbing dream, a bad attack of nightmare; but these evidences were there, and it had been real.

Two years afterwards, I saw, in our weekly paper, that Dead Ned and two of his companions had been transported for manslaughter in a midnight scuffle.

## SUCCESSFUL TREATMENT OF CONSUMPTION.

THE painful frequency and fatality of lung disease is one of the saddest elements of our insular existence, and any well-grounded scientific remedial appliance must always be hailed with satisfaction. The disease, known among medical men as *phtisis pulmonalis*, and otherwise as *consumption*, is due to a tubercular or putrid condition of the lungs—a condition which has hitherto been most difficult of cure, resulting in a gradual 'wasting away' of the patient, and but too frequently ending in a lingering death and an early grave.

In considering the subject of the treatment of this disease, medical men acknowledge that the question of atmospheric conditions takes precedence of others; hence the richer class of patients are generally advised to take their flight from the cold and variable regions of the north, to the milder and more equable temperatures of the south. The object aimed at is to check the septic or putrid condition of the lungs; and this, in Britain, is rendered possible by the use of antiseptics in the treatment of the disease. An antiseptic is simply a preservative against decay; peat-moss being perhaps the best known of the various substances possessing this property. The same antiseptic qualities are contained also in the smoke of peat—'peat-reek'; hence, the increase of consumption among the native Highlanders has been attributed by a high authority to the changes which have of late years taken place in the domestic arrangements of their homes, and notably to the substitution of modern fireplaces and coal for the old peat-fire in the centre of the apartment. The smoke of peat, by virtue of the antiseptic substances it contained, had a marked beneficial action on the lungs of those breathing it.

The question therefore arises, in the treatment of consumption by antiseptics, should the employment of the antiseptic be local or constitutional? This was discussed in the *Lancet* of November 27, 1880, by Dr G. Hunter Mackenzie of Edinburgh;

which article, and a subsequent one in the same journal, form the basis of our present remarks on the subject. Dr Mackenzie has for some time recognised that the employment of the antiseptic in cases of consumption must be local rather than constitutional, and he has in the articles referred to fully explained his system of topical medication. For more than two years he has used what he calls a naso-oral antiseptic respirator—that is, a respirator that covers both the mouth and nose, and contains a volatile antiseptic, such as creasote and carbolic acid, or creasote only, which is drawn into the lungs of the patient with each inspiration. The respirator is not liable to get out of order, and is easily worked. Dr Mackenzie has treated various patients with success. In the first-mentioned article, he briefly refers to two cases; one that of a girl of seven years, and the other a young man of twenty-five—the latter having the right lung much affected—and both of these patients recovered by the use of the respirator.

In Dr Mackenzie's second article to the *Lancet* of May 14 of this year, he gives a more detailed account of a patient in Edinburgh whom he treated in the way indicated. The patient was a young man of eighteen, whom the physician was called to see in October 1879, and whose lungs were then found to give undoubted signs of disease. During that and the following month the treatment embraced the continual administration of cod-liver oil and hypophosphites, quinine and digitalis, &c.; but there was no disputing the fact that the disease, in spite of this and similar treatment, continued to make rapid and alarming headway. Under these circumstances Dr Mackenzie, on November 26, began the system of topical medication by means of the respirator. The general results of this changed treatment were, a slight fall of temperature, a great diminution of the cough, marked improvement in the appetite and general strength, as also in the physical condition of the lungs. To assist in determining the relationship between the particular method of treatment employed and the improvement in the patient's condition, Dr Mackenzie, on the 25th of February 1880, discontinued the creasote and carbolic inhalations; when the patient decidedly relapsed—the cough returned, the temperature was heightened, and the patient expressed himself as not feeling nearly so well as when wearing the respirator. At his own desire he resumed the inhalations, and again most marked improvement followed. By June, he was able to take a walk of four miles with at difficulty.

'The further history of the case,' says Dr Mackenzie, 'is of interest. During the late severe winter the patient went about rather freely, and, contrary to my advice, abandoned altogether the creasote inhalations. The result was that about the beginning of the year he had a relapse, with a return of the cough, night-sweats, and other symptoms, but not to the same extent as formerly. He now, of his own accord, resumed the use of the respirator, and precisely the same results as on the two former occasions followed. When I had an opportunity of examining him on March 8th last, there was no cough, expectoration, or night-sweating; the appetite was good, and the patient felt "very well." He had slightly increased in weight. He was not by any means "the picture

of perfect health," but he had a very different appearance from what he presented before commencing the use of the respirator.'

'There can,' he adds, 'be no doubt whatever, that the success in this case was owing to the particular method of treatment employed, namely, causing the patient to respire as continuously as possible an "antiseptic" atmosphere.' The inhalations should be for *lengthened periods*; intermittent spraying or inhaling not producing the same result. 'In order to insure success, the application to the lungs must be made *continuously*.'

In connection with this all-important subject, we have received the following account from a correspondent, of a case successfully treated after the same method. He says: 'An editorial article in a London newspaper, commenting upon a communication from Dr Hunter Mackenzie of Edinburgh, which lately appeared in the *Lancet*, regarding a case of successful treatment of acute phthisis by means of the inhalation of creasote and carbolic acid, has attracted my attention; and as Dr Mackenzie's experiments would seem to be further confirmed by a case in the island of Sanday, in the Orkneys, within the last few months, a few of the particulars may be of interest to the readers of *Chambers's Journal*.

'The patient, a young man of some twenty years, had evidently contracted this fatal disorder, and was apparently making rapid progress in becoming one more victim to the insatiable malady. The usual allopathic remedies had been prescribed by a worthy physician, after careful and repeated examinations by means of the stethoscope; but these did not seem even to afford any appreciable check on the course of the disease. Neither the patient nor his relatives anticipated anything but a fatal termination in a short space of time; and the medical adviser of the family did not seem to entertain any more favourable opinion. The symptoms manifested at this time may be said to have been extreme prostration, the body wasted and shrunk, absence of appetite for food, constant and racking cough, the breathing short, and attended with labour and moaning, and the pulse generally running quite one hundred and twenty degrees a minute.

'A friend, to whom the inhalation of creasote, combined with other compounds, had been prescribed for a tendency to bronchial affection, tendered the use of his prescription, hoping that the use of the "inhaler" might afford some relief to the oppressed breathing of the patient. The inhalation of the compound was alternated with carbolic acid; and from the commencement of this treatment, supplementing, but not at first superseding the doctor's prescriptions, there began a slow and gradual, but very decided, improvement in the health of the individual. The almost sepulchral pallor and discoloration of the features in a few weeks began to give place to more healthy hues; with reviving appetite and digestion there came a corresponding increase in flesh and strength of muscle; the breath gradually improved and the cough ceased; and for several weeks the young man has been able to engage with comparative vigour in the ordinary duties of life. From an eager relish for cod-liver oil up to the time of the employment of the inhaler and these antiseptics, in a short time it became nauseous

and repulsive to the taste of the patient; and the use of both the cod-liver oil and the ordinary prescriptions was discontinued after a brief period of the use of all.

'I cannot assume to say that these remedies have been the material means of restoring my brother, for such he is, to convalescence; but that he was, to human eye, but a step from the grave—that he is now enjoying health and strength, and still continuing to improve—and that these were the remedies and means employed, and to all appearance successfully, are facts which may easily be authentically confirmed. I cannot help remarking that the publication of the results of Dr Mackenzie's experiments is remarkably coincident with the expiry of a reasonable time for the demonstration of the efficacy of the treatment in the case of my brother; and it surely, at least, serves to demand that it receive adequate consideration at the hands of the medical faculty of this country.'

We may mention that the Naso-oral Respirator is made large enough, as already stated, to cover both mouth and nose, and contains a sponge which is saturated from time to time as required with a solution of creasote and carbolic acid in equal parts, or of creasote only. The respirator should be worn by the patient as continuously as possible, and the inhalations should from time to time be deeply drawn, so as to make the volatile antiseptic permeate the lung. We have seen a sample of this apparatus at the shop of Mr J. Gardner, surgeons' instrument maker, 45 South Bridge, Edinburgh, from whom a circular may be had containing printed instructions for its use, with prices, &c. The respirator may also, we believe, be obtained by applying to any respectable dealer in surgical instruments in London, or elsewhere in the country.

## THE HOME OF THE HAPSBURGS.

AMONGST the many costly nuptial presents recently received by Rudolph, Crown-Prince of Austria, there was none which in romantic interest could vie with that of the Corporation of Vienna, which took advantage of the occasion to acquire, on His Highness's behalf, the ruined Castle of Hapsburg, near Aarau, in Switzerland, the ancient home of the House of Austria. A few years ago, the royal family of Austria were anxious to purchase the ruin on their own account; but the pride of the Swiss rebelled against the proposal, and the negotiations accordingly fell through. Now, however, the acquisition has been indirectly effected, the Swiss authorities probably thinking that, in view of the auspicious occasion, it would be ungracious to veto the transaction.

The Castle of Hapsburg is situated in the canton of Aargau, in the north of Switzerland, midway between Zurich and Basle, a district which lies quite out of the track of the ordinary tourist. Feudal castles have vanished from the Swiss landscape almost as completely as feudal laws from the Swiss statute books, and feudal traditions from the hearts of the Swiss people. In this respect, however, the district round Hapsburg is an exception to the general rule, for many of the castles on the banks of the Aar have escaped destruction, and some of them are still in the hands of the old noble families of

the country. But though the castles and some scattered descendants of the great nobles who inhabited them, still remain, feudalism is no longer a living power in the land; feudal reverence has perished with feudal law; and in Aargau, to be of noble birth is to be an object of jealousy, and of petty insults and annoyances at the hands of the peasantry and *bourgeois*, and sometimes even of the local authorities of the district.

On alighting from the train at the village station of Wildegg, on the Aarau-Zurich line, one finds one's self in the centre of a narrow valley, girt on each side by thickly wooded heights, between which dash the turbid glacier waters of the Aar. The irregular building to the left, on the far side of the river, is the castle of Wildenstein, round which gather a thousand romantic traditions. Strange to say, this castle is in Scotch hands, having been recently taken and refitted by a distinguished Anglo-Indian member of the Strathallan family. Above the village, to the right, towers the Castle of Wildegg. This castle, which is also of great antiquity, is still in the hands of an old Swiss family, who throw open to the public the grounds and the *Rittersaal* or Knights'-hall of the castle, which has recently been renewed in strict keeping with its mediæval traditions. Hapsburg itself stands some four miles beyond, on the same side of the river; but for the present it is hid behind a shoulder of the Wildegg height.

Such was the scene which presented itself to us on arriving at Wildegg Station one forenoon in October last, bent on a visit to the ruins of Hapsburg. We first climbed the steep slope to Wildegg Castle, where, having an introduction, we were hospitably received; but Hapsburg being our goal, and our time being limited, we did not delay long there. Quitting the terrace garden, we pursued a narrow path over the picturesquely wooded heights. A mound in the wood is pointed out as 'The Soldier's Grave'—one of Napoleon's heroes having been buried there, whilst the French lay in Wildegg. Farther on, there is another grave in a glade known as 'The Lady's Valley.' The story goes that nearly a century ago, a young lady who was coming on a visit to Wildegg saw in a dream, before leaving Paris, the place where she was to be buried. As she was wandering through the woods one day, after her arrival at Wildegg, she came suddenly on the spot now known as 'The Lady's Valley,' and at once recognised it as the place she had seen in her dream. Three weeks later, she was buried there!

As we emerged from the wood, Hapsburg for the first time came into view. The castle stands on the summit of a steep grassy slope above a straggling village. The situation is commanding, but not nearly so picturesque as that of many of the other castles in the neighbourhood. A walk of three-quarters of an hour across the intervening plain, and then a climb of some ten minutes up the height, brought us to our destination. Of course we were disappointed. We expected to find a ruin, whose interest would be commensurate with the historic greatness of the house that bears its name, but were disappointed. A low square tower, and four plain stone walls, broken down in places—such is the Castle of Hapsburg.

The castle is said to have been built early in the eleventh century; and certainly some of the walls look old enough to be reasonably ascribed to that date; but we were neither of us so skilled in archaeology as to venture to pronounce with confidence upon the subject.

And this, then, is Hapsburg! True; but we have spent the best part of a day in coming to see it; and is there, after all, nothing to be seen? Asking the *concierge*, who inhabits part of the castle, what he had to show us, he—with an eye to a couple of probably thirsty customers—replied, that we might have either wine or lemonade, but that, unfortunately, he was at present out of both beer and of *Schnapps*. We told him we should think of such things by-and-by, but that, first of all, we wanted to see all the objects of interest about the castle. The good man seemed at first somewhat puzzled by our request; but suddenly, there was a gleam of intelligence in his face, and he hurried away. A minute afterwards, he returned with his Visitors' Book! and opening it at a well-thumbed page, he pointed to the signature of Rudolph, Crown-Prince of Austria, who, it appears, visited the castle in 1878. Other information, the old man had none to give us; and indeed, he seemed so ignorant of the traditions of the place as to regard the autograph of Prince Rudolph as interesting, not because he is a Hapsburg, but because he is Crown-Prince of Austria.

We ordered some wine, and sat down on a bench under a tree, near the castle door, and reflected upon the associations that were interwoven with this old fortress of Hapsburg. This tame, uncared-for ruin has given rulers to Germany, Austria, Italy, Spain, the Netherlands, and America; and has modified the course of the world's history no less in this the nineteenth, than in the thirteenth century. From these dilapidated walls there sprang the authors of the Diet of Worms, the Spanish Armada, the Thirty Years' War, the Pragmatic Sanction, and the Partition of Poland. From these narrow windows the ancestors of Charles V. and Philip II., of Maria Theresa and Marie Antoinette, watched the restless windings of the Aar; and to this very portal where we sit, the Margrave of Anspach and Baireuth, head of the House of Hohenzollern, dashed up, six centuries ago, to offer to Count Rodolph of Hapsburg, in the name of the Electors of Germany, the imperial crown of Charlemagne!

Doubtless, there was good cheer in this old castle in these bygone times; but alas! as we found to our cost, the old cellars must be long since dry. We agreed that we had never tasted worse wine; indeed it was so bad, that, unable to drink it, yet unwilling to wound the feelings of the *concierge*, by leaving it undrunk, we made a libation, by pouring it on the ground, to the memory of the heroes of the House of Hapsburg.

A walk of half an hour brought us again to the railway at the town of Brugg. Here there is an ancient church, roofed and in pretty good repair, though not now used for public worship, where, for many centuries, long after their attainment to greatness, were buried the members of the House of Hapsburg. The stained windows in this church are, by many competent authorities, deemed the finest in Europe. They were recently

copied for a Swiss Archaeological Society by Mr Graeter of Basle, a celebrated Swiss engraver, who, for this purpose, was lowered from the roof of the church in a basket. The graves of the Austrian family are behind a partition in the west end of the nave; and I am sorry to say this seems to be the least-cared-for part of the building. Perhaps some steps may be taken to restore and refit the whole church, now that the House of Hapsburg has once more planted its foot upon its native soil.

## THE MONTH.

### SCIENCE AND ARTS.

THE recent debate on Mr Anderson's Patents' Bill has shown that there is a very marked feeling as to the necessity of reform in the laws relating to inventions. We have more than once called attention to the high fees payable in this country by inventors for the privilege of protecting their ideas, and to the manner in which such charges must cripple the progress of inventive brain-workers. That the costs of an English patent are much in excess of those customary in other countries may be seen from the following figures, which in each case include the first payment and the sum demanded at the end of three years: Belgium, four pounds; United States, fourteen pounds; Germany, eighteen pounds; France, twenty pounds; Austria, twenty pounds; England, one hundred pounds.

Messrs Tuchman & Co., of St Thomas's Street, London, have lately introduced a new Fire Annihilator in the form of a liquid consisting of chalk, alumina, and certain silicates dissolved in water. From recent experiments, it would seem that the compound is really what it professes to be. A timber shed, besides two stacks of wood and straw, which before being ignited, were saturated with petroleum, were extinguished by the new agent in less than two minutes, the liquid being merely applied to the burning mass by means of ordinary buckets. Apart from its annihilating properties, this liquid is said to render anything to which it has been applied absolutely fireproof.

A few years ago, the intended destruction of a certain picturesque old London inn suggested to a few artists the desirability of preserving its outlines, for the eyes of future generations, by the aid of photography. Many other old houses seemed to be worthy of similar attention, and in this way the 'Society for photographing Relics of Old London' began its useful work. This Society is now issuing, at regular intervals, permanent (auto-type) prints of many interesting spots which have already been, or will soon be, cleared away for more substantial, but possibly less picturesque structures. There are many cities far more rich in such relics than the Metropolis, and it would be well if similar precautions were taken for preserving their features. The Honorary Secretary of this Society is Mr A. Marks of Long Ditton, Surrey.

It is not often that the American is forestalled in his own country by any new venture of a

commercial nature; but a recent proposal to turn one of the avenues of the famed Mammoth Cave of Kentucky to practical account, comes from an enterprising Frenchman. He proposes to rent part of the Cave for the purpose of mushroom cultivation. The temperature of the Cavern is nearly uniform all the year round, and the deposits of the refuse of bats—of which there are large numbers in the Cave—when mixed with other fertilisers, are considered to be favourable for the propagation of edible fungi. Should the scheme prove successful, we may possibly have imported to this country tinned mushrooms, in addition to the vast variety of all kinds of food in canisters which daily reach our shores.

A disadvantage in the use of these tinned provisions is represented by the difficulty of opening the cans. This has been met and obviated by the use of a very simple and ingenious form of tin, invented by Mr J. Featherstone-Griffin, of Upper Thames Street, London. The lid of the can fits upon a sloping rim, and is there soldered air-tight. A few blows on this lid force it over a projecting shoulder, and at once break the line of solder all round. It can then be removed without difficulty. The cans are not damaged by the operation; so that if it would not exactly pay to send them back to the place of export, they will prove useful allies to the careful housewife.

Sir John Lubbock has brought before the Linnean Society some new observations upon Ant-life. These bear more especially upon the sensibility of those insects to different-coloured rays of the solar spectrum. The experiments which he described were founded on the fear shown by ants when their nests are disturbed, and their eagerness to carry their grubs to a place of darkness and apparent safety. By placing glasses of different colours above the ants, he soon found that they preferred to hide their treasures beneath certain colours, in preference to others. They showed a remarkable sensibility to violet light, preferring it to what is to us a far more transparent colour—namely, yellow. But the most remarkable fact elicited is that the sight of ants does not seem to be limited to what we regard as the visible rays of the spectrum. The ultra-violet rays—which to us are quite invisible, and are only made patent to us by experiment—seem to be apparent to them. To test this, upon the ants' nest a spectrum was thrown, the colours of which were so arranged that the disturbed inmates might retreat to the ultra-violet region, or to the space covered by the visible red rays. They invariably ran to the latter; showing that it presented to them a nearer approach to darkness, and therefore safety, than did the ultra-violet region, which to our eyes would be black as night. The author of the observations incidentally stated that some particular ants had been under his care for seven years, and that they were still vigorous and in perfect health. We believe that there is no record of similar longevity among insects; but this may

possibly be for want of such careful study as the busy ants have received.

The work of the modern chemist consists mainly of two great divisions—namely, analysis and synthesis. The former consists in dividing a compound substance into its component parts; and the latter in reversing that operation, or collecting all the materials wherewith to put together any particular compound. A remarkable instance of the latter operation was afforded some years ago by the manufacture from mineral agents of the vegetable colouring material of madder. This remarkable triumph of science has just been equalled, if not excelled, by the production of artificial indigo. That this discovery is of great importance, may be judged by the statement that the value of natural indigo imported here amounts to about two millions sterling annually. The artificial product cannot at present compete with imported indigo, for the cost of manufacture is too great. But there is every reason to believe that in the near future there will be less necessity for its importation.

It will be remembered that great interest was excited last summer by the discovery, in the *Patria Regia* tank in the Botanic Gardens, London, of a fresh-water jelly-fish or *Medusa*. Although, during the late winter, this tank was cleared out and remained for some months empty, these curious organisms have again made their appearance, and very nearly on the anniversary of their first discovery.

While the inhabitants of India are doing all in their power to destroy the serpents which year after year find so many thousands of human victims, the Fellows of the Zoological Society at home are intent upon rearing a brood of young pythons. A python in the Society's Gardens recently deposited a number of eggs, and is now engaged in the motherly duty of incubation. The eggs are carefully covered by the reptile's folds, and the mother herself is hidden from curious eyes by a blanket. The last attempt at snake-hatching was in 1862, and for some reason it failed, although after-examination showed that many of the eggs were fertile. Naturalists hope, in the present instance, for a more successful issue.

The great engineering feat of cutting a passage through the Isthmus of Suez seems to have initiated some bold proposals of a similar nature. M. Lesseps is already busy upon the narrow neck of land at Panama, and we hope that it will soon yield to his genius and perseverance. In the meantime, another well-known Frenchman has been commissioned to pierce the Isthmus of Corinth, which separates the Adriatic and Ægean Seas. The ruins of the works begun with the same object by the Emperor Nero, are still shown at Corinth. Whether these were abandoned for want of capital, or because of the absence of means for blasting the rock, is unknown. In the present time, if money be forthcoming—as it assuredly will be for such an important work—dynamite will solve the rest of the question.

Those who have visited any of the large agricultural shows will remember the immense machine designed to supersede the plough, which is known as Darby's Digger. It resembles in outward appearance a huge traction engine moving sideways, with projecting forks or spades, which are alternately lifted and buried in the

ground as the monster advances. Many improvements have lately been made in this modern representative of spade-culture, and it is doing good work in the character of a hired farm-servant at Writtle.

The pollution of streams, and consequent destruction of fish, about which we occasionally hear so much, seems to have its counterpart in the ocean upon a very extended scale. The Gulf of Mexico suffered in 1844, in 1854, in 1878, and again last year, from a widespread destruction of marine life, the water being apparently poisoned. The keeper of the Egmont lighthouse reports that, in October last, the waters were covered with dead fish, and that the next day dead and dying fish were strewn along the shores. The effluvia from the putrefying mass became so terrible, that it was almost impossible to withstand it, until a gale brought unpolluted water and air in its wake. The curious phenomenon will probably be traced to the escape of volcanic gases from the bed of the Gulf. Professor Baird is inquiring into the matter, and his Report upon it will be looked forward to with interest.

A lecture was recently delivered before the Paris Geographical Society by Dr Lenz, who has just returned from an expedition through the Desert of Sahara. He states that the proposal to turn the Desert into an inland sea by flooding it is impracticable. He notices that the climate is not so hot as has been generally believed—that wild beasts are scarce—and that the only enemies to be dreaded are the ferocious *Touareg* tribes.

There is also current a belief that the central part of South Australia consists of little else than desert land, which by reason of its absence of water and every kind of vegetation, is inhospitable to man and beast. Mr Sauger has recently published in the *Colonies* a Report which will go far to remove this impression. He tells us how a great part of the land is intersected by watercourses, which branch out into flood-flats or lakes; and although these are, in certain seasons, dried up, or much reduced in bulk, there is reason to believe in the existence of an immense store of subterranean water. It would thus seem that by well-sinking, as well as by careful storage of the water now allowed to run to waste, this so-called Desert might, with the assistance of scientific husbandry, be turned into a fruitful land.

The 'dark continent' is to receive another intrepid traveller, in the person of M. Léon Lacroix, who has brought before the Lille Geographical Society a scheme for penetrating the country in a hitherto unexplored region. The difficulties of the enterprise are very great, but not more than those already successfully overcome by explorers in other directions. M. Lacroix hopes, by following the course of the river *Welle*, to reach a part of the country about which absolutely nothing of a definite nature is at present known. We may well wish the author of the enterprise *God-speed*.

A voyage of a far different kind has just been commenced by Mr Benjamin Lee Smith, who for the fifth time has started on a private expedition to the Arctic regions. He intends to proceed direct to *Franz Josef Land*, a large portion of which he explored and mapped last year. He carries with him the materials for building a house, which will serve as a refuge, in case of accident,

not only to his own crew, but to any travellers who follow them. The twenty-five men who compose the expedition are provided with rations for fifteen months; but the voyage is not expected to last more than one-third of that time.

A paper lately read before the American Society of Civil Engineers by Mr Shaler Smith gives some curious records of that gentleman's observations with relation to wind-pressure and its effects. During a storm at St Louis in 1871, the wind overturned a locomotive—a feat requiring ninety-three pounds on the square foot. Six years later, a jail at St Charles was wrecked by a pressure of eighty-three pounds. Besides these extraordinary cases, the author quoted several instances in which bridges were destroyed, and trains were blown bodily from the rails. People who are fond of grumbling at British weather, may remember with thankfulness that they are rarely if ever visited by such ill winds as these.

Mr L. B. Bertram, of 25 Cornwall Road, London, has recently obtained a patent for the construction of solid ink printing-rollers and colour-pads for rubber and other stamps. The ingredients of the compound employed consist of gelatine, glucose, glycerine, aniline dye of any desired colour, and acetic acid. This invention would seem to be a new application of the 'Graph' composition commonly used for copying manuscripts and drawings.

The Comet which recently formed so attractive an object in the heavens, has been, like everything else that makes its appearance in these advanced days, subjected to the critical eye of the photographic camera. The spectrum so obtained has enabled Dr Huggins to detect certain bright lines, which he attributes to the presence of carbon. There is also evident in the photograph a continuous spectrum showing what are termed the *Fraunhofer* lines. In this way the photographic image has corroborated certain observations recorded by the same observer in 1868—namely, that comets shine partly by their luminosity, and partly—like other members of the solar system—by light borrowed from the sun.

M. Salignac intends, it is said, to exhibit his new Electrical Cooking-stove at the forthcoming Electrical Exhibition at Paris. It is to be fixed in the grill-room of the attached restaurant, so that visitors can partake of a chop or steak cooked by the electric current. This application of electricity is suggestive of enormous revolutions in the kitchens of the future, both as regards the use of coal and gas for cooking purposes.

The recent explorations in the Gaboon—undertaken by Hugo von Koppenfels—have rendered clear the existence of a hybrid between the gorilla and chimpanzee. The explorer thus accounts for the many so-called species of apes which obtain local names from the natives. He further found that the mammalian fauna round about the Gaboon includes very few of the large animals common in the interior. The manatee—which our readers will remember has lately figured in our home aquaria as the 'Mermaid of Tradition'—is gradually disappearing, owing to the pertinacity with which it is hunted, its succulent flesh being much esteemed by the natives.

The highest point in Britain—the summit of Ben Nevis—is now furnished with a meteorological station, which transmits daily reports for publica-

tion in the *Times*. Mr Wragge—who has undertaken the duty of observer, on behalf of the Scottish Meteorological Society—lives at the foot of the mountain, and makes the ascent every day, starting on his laborious journey at five A.M. Considering that the mountain-path has lately been deep with snow, and that mist is frequent, the undertaking is by no means free from danger, to say nothing of discomfort.

We not infrequently hear of lamentable accidents in coal-ships not only from the explosion of confined gas, but also from the spontaneous combustion of the cargo. Herr Haedicke has by experiment shown these fires to be due to the presence of iron pyrites, which undergo a chemical change gradually leading to ignition. The occasional application of a jet of steam to moisten the exposed surfaces of the coal would, he considers, render accidents of this class almost impossible.

We have already indicated the intention of the Royal Commission upon Accidents in Mines to inquire into the suitability of the electric lamp as a help and safeguard to colliery workers. Experiments having this object in view have lately been carried out at the Peasley Colliery, near Mansfield. As it was necessary to choose some form of lamp entirely cut off from communication with the surrounding atmosphere, the Swan lamp, which consists of a filament of incandescent carbon inside an exhausted glass bulb, was selected for trial. The number of lamps in circuit, which were actuated by a Gramme machine at the pit-mouth, were no less than ninety-four. The Commissioners expressed their satisfaction at the result of these experiments, which extended over two days; and we may therefore hope that one element of danger will in the future be remitted from the many which threaten the life of the poor coal-miner.

Captain Cator has invented an Alarm Buoy, which is intended to obviate such a lamentable catastrophe as that which a few years ago capsized the *Iron Duke*. It will be remembered that, in a dense fog, that ship was scuttled by the ram of another vessel which was following in its wake. The new buoy consists of an iron tube with conical ends, which is towed behind the vessel it is intended to protect. Like a patent log, it possesses a screw, which revolves as it is pulled through the water. Each revolution is marked by the stroke of an attached gong, which gives out a warning note to any vessel in its vicinity. Further than this, the time elapsing between each stroke will enable the ships of a squadron to reckon the rate at which their leader is steaming; and thus keep up a uniform speed, while the sound itself will prevent them from becoming unduly separated from one another.

The machine-gun trials have resulted in a Report, by the Committee appointed, in favour of the two-barrel Gardner gun, as being the most suitable for the general purposes of both military and naval services. Where a more powerful weapon is occasionally required for special work, they recommend the larger form of Gardner, which possesses five barrels.

The improvements which have lately been made in the cultivation of sugar-beet, as well as in the manner in which the saccharine is obtained from the raw material, have once more turned the attention of agriculturists to the possibility of

growing the root, and producing sugar from it, in this country. The extent of this industry in various parts of Europe, where neither soil nor climate offers special advantages, which we lack, is enormous. Indeed, the production on the continent alone is estimated at more than one-third of the amount of sugar manufactured from all sources in the whole world. The value of our present annual import of beet-sugar amounts to between seven and eight millions sterling; and, with the recent improved mode of culture and manufacture already alluded to, there seems no reason—except it be the natural half-heartedness born of years of disappointment among our farmers—why we should not produce at home the sugar which this large sum represents. In undertaking this new branch of industry, our agriculturists would have the advantage of profiting by continental experience in choice of machinery and in methods of manufacture; and they would not have to make a market for their produce, as in the case of a new article of diet, for they would find one ready made.

The annual Report of the Inspectors of Irish Fisheries forms a very favourable contrast to the general news which reaches us from the sister isle. In every district but one, the salmon harvest has been far above the average, in some cases more abundant than in any previous year. Even in the Cork district, where poaching is carried on openly in absolute defiance of the law, and where the fish have been destroyed in every illegal manner, the salmon have not declined in numbers. It is only within the last few years that fish-culture has been brought to the position of a fine art, and that various Exhibitions of fishery-apparatus have been held. That which was recently held at Norwich proved a success; and now we hear of a proposal to hold a National Fisheries Exhibition next year at Edinburgh.

An ingenious method of cooling railway carriages or travelling cars of any description has been invented and patented by Mr Fridenberg of Philadelphia. A revolving shaft, furnished with blades which act as fans, runs along the inside roof of the car. It is set in motion by a small windmill outside, or, in the case of a carriage travelling at a slow speed, such as a tram-car, by belting connected with the axle of the wheels. We fear that a large proportion of British travellers would fail to see the advantage gained by this circulation of the air. It is a common experience to find a railway carriage crowded with passengers who keep every window rigidly closed. They appear not to object to being poisoned, but they certainly will not sit in a draught.

A new process for working the rare metal iridium has been brought forward by Mr John Holland of Cincinnati. Iridium has the appearance of steel, but is much harder; it represents, indeed, such a refractory material, that hitherto it has been worked with the greatest difficulty, neither hammer nor file making any impression upon it. The new process consists in adding phosphorus to the metal after it has been brought to a great heat. The iridium is then cast in moulds, after which the phosphorus is eliminated. As an electrode for the arc form of electric lamp, iridium is unrivalled. Its cost—at present far above that of pure gold—has hitherto limited iridium to the laboratory; but the new method of

manufacture will probably bring down its price, and make it popular in many industries where small quantities of intensely hard material are required.

### OCCASIONAL NOTES.

#### SCULPTURING ON GRANITE WITH STONE IMPLEMENTS.

IN a second volume on *Excavations at Carnac*, in Brittany, by the late Mr James Miln (Edinburgh: David Douglas), an interesting statement is made as to the manner in which ancient sculpturing on granite blocks may have been executed in an age when as yet iron tools were unknown. The statement is as follows: 'It has been held by some archaeologists that these sculpturings could not have been cut without the use of iron tools; but others have of late years succeeded in reproducing similar markings on granite slabs, using solely stone implements; and in doing so they found that diorite and other such tough stones cut the granite better than flint. This corresponds with the practice of the stone-cutters of the present time, whose steel tools for cutting granite are of a much softer temper than those they use for cutting sandstone. The great sculptured stone of Montezuma, in Mexico, is a striking proof of the extent to which granite can be sculptured with stone implements. Gama, in his work describing this stone, states that ten thousand Indians were employed in transporting it to the city of Mexico, where it was sculptured by thirty workmen with stone axes.'

#### THE ARTIFICIAL CULTURE OF SPONGES.

A Report has been issued by Professor Baird, the Fish Commissioner to the United States, in which some interesting details are given of the way in which the sponge of commerce may be produced by artificial culture. Professor Oscar Schmidt, of the University of Grütz, has been so successful in his preliminary efforts in this direction, that the Austrian government have authorised him to attempt the development of the industry on the coast of Dalmatia. The process is very simple, consisting in selecting the proper season in the spring, dividing a living marketable sponge into numerous small pieces, and then fastening them to stakes driven into the sea-bottom. These fragments at once begin to grow out, and at the end of a given time each one becomes an entire sponge. According to Mr Schmidt, three years is a sufficient length of time to obtain from very small pieces fair-sized sponges. In one experiment, the cost of raising four thousand sponges amounted only to nine pounds, or about a half-penny each; and this sum included the interest for three years on the capital employed.

### 'W A G E S.'

#### I.

It was a merry brook, that ran  
Beside my cottage-door all day;  
I heard it, as I sat and span,  
Singing a pleasant song alway.

I span my thread with mickle care;  
The weight within my hand increased;  
The Spring crept by me unaware;  
The brook dried up—the music ceased.

I missed it little, took small thought  
That silent was its merry din,  
Because its melody was wrought  
Into the thread I sat to spin.

#### II.

It was a lark that sang most sweet  
Amongst the sunrise clouds so red;  
I knew his nest lay near my feet,  
Although he sang so high o'erhead.

And though he sang so loud and clear  
Up in the golden clouds above,  
His throbbing song seemed wondrous near;  
I twined it with the web I wove.

The long days' glory still drew on;  
Then Autumn came; the Summer fled;  
The music that I loved was gone;  
The song was hushed—the singer dead.

#### III.

I wove on with a steadfast heart;  
My web grew greater, fold on fold.  
I bore it to the crowded mart;  
They paid my wage in good real gold—

Real gold, and fine. I turned me back.  
The city's dust was in my throat—  
No brook ran babbling down its track;  
No bird trilled out a tender note—

But city noise, and rush, and heat.  
The gold was red like mingled blood.  
Oh! for the cool grass to my feet,  
The bird's song, and the babbling flood.

#### IV.

I turned me, and I went my way—  
My lonely, empty way, alone;  
The gold within my bosom lay;  
My woven web of dreams was gone!

Did the gold pay me? No; in sooth.  
Gold never paid for brook and bird,  
Nor for the coiled dreams of youth,  
Nor for the music that I heard.

My web is gone! The gold is mine.  
And they who bought it, can they see  
What dreams and fancies intertwine  
With every woven thread for me?

F. C. A.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. To insure return in case of ineligibility, postage-stamps should accompany every manuscript.

3d. MANUSCRIPTS should bear the author's full Christian name, surname, and address, legibly written; and should be written on white (not blue) paper, and on one side of the leaf only.

4th. Poetical offerings should invariably be accompanied by a stamped and directed envelope.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

## UNCLASSED MEN.

HOWEVER narrow be the circle of our acquaintance, we are sure to find in it one or two young men who are off the high-road of life and wandering in the wastes of leisure. While others are pursuing professions and callings by which future existence will be assured, the youngsters we are treating of are learning nothing, and living as if they were of no further use, while in fact they are only rising to the heyday of life. As we watch them getting taller, stronger, and lazier, we know the poor fellows are drifting towards 'the bad,' and that their friends and themselves are going to have some painful experiences. For this world has always been an uncomfortable place for people having no direct aims. Social gravitation is as resistless as cosmical gravitation; and as the meteor is reduced to dust by the attrition of the atmosphere, so the 'unclassified' man is often dissipated into a state of inutility by the social forces against which he collides. No gifts of fortune, no altitude of rank, can wholly relieve us of the laws of life. We are bound to contribute to the harmonious working of things, or pay the heavy penalty laid upon discord.

The recruits of the unclassified army, which is getting larger with our increasing wealth, are derived from various sources. Many are younger sons of good families, waiting for political fair winds to run them into some snug harbour in the official world. But often the storm keeps them in the offing until it is too late, or others are preferred; and they find themselves bearded men, dependent upon irascible fathers for pocket-money, which does not go so far in cigars as it used to do for pastry. And they find smoking pleasant. It gets over the time when others are busy and they are left to keep themselves company. Billiards, too, are pleasant, but woefully expensive for a fellow who makes no money on his own account. Some of the unclassified ponder on this; and improve the shining hour, and learn to eke out their pitiful income. However, Nemesis stands behind the cue,

and the gentlemanly method of making a few pleasant guineas only makes matters the worse. A man gets shunned, as too 'professional' in his style of play, and somehow becomes reckoned among the dubious members of society.

The only sons of widows add abundantly to the unclassified. Bereft of a husband's guidance, many poor ladies keep young Tom at home when he should be learning a trade or following an occupation. 'The boy is so useful, so good, and such a comfort, that he cannot be spared yet a while. Though his cheeks be rosy, his shoulders broad, and his voice stentorian, there is a latent delicacy of constitution to be feared. His poor father was not strong, and Tom must not go to business too soon.' The years slide; and Tom at twenty has no more idea how to earn his bread than he had at ten. He can draw, paint a little, play a sonatina, and is undeniably smart at making a pigeon-box or rabbit hutch, being quite handy with joiners' tools. Still, if Tom were to seek hiring in the market-place, he would be put in the lowest grade of unskilled labourers. With all his education and high moral excellence, with noble aspirations, with deep filial piety, nay, with a strong wish to do something manly, the commercial value of the amiable youth is about ten shillings per week. When mamma dies, and the loving world in which he has lived flies like a fairy phantasm, poor Tom will wake to the horrible truth of his 'worth.' He will realise in all its agony what it is to be unclassified in a country where every grade is defining its borders more minutely hour by hour.

The 'failures' of society contribute largely to the unclassified. These unfortunates, who are everything by turns and nothing long, finally land among the nondescripts. The law was too dry, medicine too repulsive, literature too precarious, commerce so much competed, trade so laborious, that really it was impossible to devote a life to any of them. Nevertheless, the true vocation will be found at last. 'Try, try, try again, you know.' Alas! for the triers. Who does not know the unfortunates that have gyrated to every sentimental gust—

who are learning to do nothing else than gyrate—and who will gyrate to the end—whose lives are a series of spasms, uncontrollable by advice, by experience, by suffering? Of all the unclassified, these are the most to be pitied. Want of mental force cannot be compensated for. The most benevolent of friends grow tired of the man who can do nothing but blunder.

Then there are the dogged idlers, who will loaf and lounge and impose upon their parents— young men averse to any classification. They are utterly selfish, and dangerously unscrupulous. Rebels from birth, they continue to war with their kindred as long as the conflict can be maintained. When the parental home has been broken up, they live parasitically upon tradesmen and lodging-house keepers; and it is astonishing how long they can continue the system before it breaks down. Their very recklessness of debt seems to open up avenues for credit which are closed to honest folks. No nervous qualms ever trouble their slumbers. An army of duns may menace them; they eat and drink and smoke with serene indifference. Insults fall upon them like dew. They have perfect health. The cares, worries, and exhaustions which make the industrious frail and feeble at times, are unknown to the robust idler, who looks on placidly at their struggles to make ends meet.

Even while youth lasts and early friends remain, the lot of the unclassified is an unenviable one. The deep gratifications of an ascending career, which only busy men can experience, are unknown to them. Too much holiday destroys all perception of repose. Though idle, they are not at ease; a blank vacancy surrounds them like a debilitating atmosphere. A quite undefinable *malaise* makes them discontented when alone, and outer excitements must quench the inner pains. These can give a temporary relief; for the unclassified man, like him who has found a congenial vocation, finds joy in activity. But as youth wanes and companions depart to other scenes, or settle down to the serious purposes of life, the unclassified man finds himself treading the arid and appalling wilderness of civilisation alone. Crusoe's isolation was nothing to that of the companionless man in a populous and busy city. The eager, combating multitude pursuing alluring objects, pass him by as an inanimate thing. As by instinct, the crowd knows that he is not one of them. He does not contribute one spark to the fire that warms and animates the world. He is a loiterer among the runners, sauntering while others toil; in short, he is not 'in it.'

The silent rebuke of the toiling hosts rouses agonies in the heart of the unclassified man, who stands apart from them by accident, and not by choice. The monk-like solitude to which parental neglect or unwisdom has condemned him, is all too hard to bear. Yet what can he do in a society where the classified will not allow the unclassified to commingle? It is right for society to insist upon each of its units doing something for the commonweal. But its ranks are closed to the man who knows no craft. Special drilling must precede employment, even the humblest. In the battalions of unskilled labour, there is need of credentials of some sort. Mere muscles do not suffice. The Dock porter has a knack of turning a winch, of hoisting a bale, of stowing

coal, which has to be learned. A navvy is not merely a muscular machine. His movements are directed by an adroitness that has come from an apprenticeship more or less long. And an unformulated 'union' federates these lowly occupations, just as solidly as the trade organisations of the higher artisans.

Before seeking an entrance into such 'low' methods of gaining a livelihood, the unclassified man will have made desperate efforts to find employment in more refined walks. There he will have learned how many are situated similarly to himself. He will have found that the unclassified are numbered by thousands, and that they compete as fiercely for ill-paid but 'gentlemanly' appointments as hungry dogs for offal. If any one wishes to know something of the unclassified and their despair, he has only to advertise for a junior clerk, a time-keeper, night-porter, or other employé of the untrained sort. For days he will be overwhelmed with letters from many parts of the country. Some of them will be couched in Addisonian phraseology, betraying evidence of high culture and considerable mental power. Others will be pathetic appeals for a trial, concluding with assurances of lifelong devotion if engaged. Others will contain recitals of a struggle for bread so painful as to equal anything found in fiction. But if the advertiser wishes to know the darker depths in which many of the unclassified dwell, he will receive the applicants in person. The veil which hides the obscurer movements of society will then be lifted, and the spectator will be amazed at what he sees and hears. What waste of life, what corrosion of energy, what desperate tragedies!

The terrible epoch for the unclassified lies from the twenty-fifth to the thirtieth year. Friends and relatives of the same age are then entering upon the solid paths of life. They marry, set up establishments on their own account, become absorbed in new worlds, and forget bachelor acquaintances. The unclassified being also human, longs, like others, to form those ties which are the dearest and purest. He desires a wife and a bright home, an arena and a prize to stimulate what powers he has. But position and assured prospects are needed. The maintenance of his own existence is difficult and problematical. What parent would intrust a daughter to such an anomalously situated man? What girl would embark upon such a mad enterprise? The intolerable misery of the position sometimes so rouses the forces of the man thus placed, that he cuts through all impediments, and makes a successful career after all. The affection of a good woman supplies a motive for exertion and perseverance, which has saved thousands of men from the consequences of youthful mistakes and ineptitudes.

Some of the baser sort among the unclassified plunge into matrimony with the same crafty recklessness that they display towards tradesmen. Often they beguile a confiding girl into the most sacred of relationships for the sake of the little fortune she may possess or expect. Or failing such advantage, they marry with deliberate intent of living upon the earnings of their wives. The records of police courts furnish daily instances of the heartless villainies perpetrated by such men. They are of that low type

to which the savage belongs. Mentally and morally, they are below the standard of the race. They have no sympathy with the social amenities going on around them. Order, system, steady industry, are impossible for them. They had a place in the old warlike times. There was scope for the ferocity of their nature; the brutal pleasures of camp-life furnished their elysium; the alternations of fierce activity and large repose suited their fitful moods. Civilisation is their bane. Its exactitude, its rectitude, its utilitarianism, are all irritations and offences. Like carnivores in a menagerie, they wander in narrow environment, wondering why they are restrained. When opportunity affords them the means to gratify their instincts, society is horrified at their callous inhumanity.

Men of this kind leave a ring of tragedies more or less terrible around their path. Broken-hearted mothers, broken-hearted wives, ill-used and neglected children, fill the world with wailing and poverty and crime. Increase of years does not improve them, and this is their striking mark of dissimilarity from average men. The infinite majority *do* improve as experiences multiply. Like pebbles on the beach, most men get ground into a common contour by meliorating action. But the unclassifiable savage will not be shaped; he lives and dies in angular hostility.

Pitiful is the fate of the better sort of the unclassed who fail to get over the impediments besetting them by their thirtieth year. Precluded from living a domestic life, shut out from the ordinary encouragements and consolations of humanity, they begin to yield to the overwhelming odds against them. Few survive to forty, and these are not the best. When a man can live on a few fugitive shillings per week, in a squalid lodging, with no sanctifying object before him, he has either lived out his nobler nature, or he has not had one. In our time, when 'living' is becoming more and more a purposeful thing, to be employed skilfully and for other than personal ends, it is almost impossible for a man of high spirit and high intentions to survive the death of hope. Some of the unclassed are gifted with unusual powers, mental and emotional, and are hindered by their superiority from falling into the proscribed ranks. These cannot live in uncongenial surroundings and debarred from the virtue and the intellect of their period. They yearn to bless the world with their talents, and to leave names behind them that are not 'writ in water.' If they are rejected, they turn their faces to the wall and die.

All who have studied the question of unclassified men, will agree that it is one of serious import for themselves and for the body politic. Their existence is an evidence of society's ignorance of one of its dangerous maladies, or of incapacity to deal with it. Of course, it is impossible to have any statistical account of the numbers of the unclassed amongst us; but that they number many thousands is beyond doubt. A mass of energy is lost which ought to be turned to profitable ends. It is a subtraction from the prosperity and happiness of the nation that can be ill spared, and it must be dealt with eventually. Thrift is now a serious study for those guiding the national march. No aspect of economy is more deserving of attention than the employment of stagnant human powers.

In waiting for the hour when the unclassified will come under the sway of practical social science, much can be done by parents themselves to prevent the miseries inevitable from aimless careers. The middle class in particular must get rid of some of its delusions regarding 'respectability.' It must accept *work*, in any form, as honourable. An honest artisan is in his way as much to be respected as a physician or a lawyer. Only a pernicious pride can separate the man from his vocation. Each man is a bundle of wants, that must be satisfied, either by his own labour or by the bounty of others. And each man may be the football of fortune, and pass through all declensions of adversity. Amid all vicissitudes, however, independent bread may be won by the man who has some skill or craft that sub-serves his fellow. It is therefore the plain duty of all parents to train their boys industrially, unless they have ample means to launch them into the professions. With our ever-augmenting population, large numbers of both sexes will continue to emigrate; but without some handicraft, a man finds himself worse off in the colonies than at home. Trade may fluctuate, the capable and deserving artisan may have a period of slackness; but taking an average, he finds enough to keep himself and family in comfort. His lot is, indeed, a happy one compared with the struggling untrained man.

It is time for parents to understand that the youth who is not being drilled for a definite career, is treading the road which leads to misfortune. The rising generation will find it more difficult to get through life's conflict than the risen generation. The stupendous changes which have taken place in human destiny in the past century have only produced their minimum of effects so far. The maximum will fall upon those coming upon the scene. They will be weighted with heavier responsibilities; they will have higher tastes, more numerous appetites and desires. And they will be less able to bear poverty and despair. Order is heaven's first law; it is also that of society. Parents neglecting the business training of their boys defy both divine and human ordinances; and the suffering of the unclassed is the atonement exacted for the offence.

## THE FORTUNES OF BERTRAM OAKLEY.

BY JOHN B. HARWOOD.

### CHAPTER XXXVIII.—THE MARINE STORE.

MR WESTON sat in his snug office, in Mervyn's Yard, Southampton Branch, outwardly comfortable, but miserably ill at ease. The waste-paper basket that lay within reach of the corner of his well-furnished writing-table might have told tales, had any deft fingers and prying eyes been busy with its contents. How many times that day had the Manager begun a letter to his absent chief, and how often had he impatiently torn up the inchoate epistle, and with a quick angry 'Pshaw!' pitched the fragments into the gulf that yawns, like the hungry mouth of the grim Giaour in *Valhek*, for all such failures. Mr Weston was fretful, restless, not in an enviable frame of mind. He had given snappish answers to every clerk who approached him on business of routine, until at last the clerks feared to approach him.

'What's up with the governor to-day? He's like a bear with a sore head,' whispered the youngsters to one another, as they crept on tiptoe from desk to desk, glancing the while over their shoulders towards the door of the room wherein the Manager sat, scribbling, half unconsciously, on the paper before him, 'Bertram Oakley,' 'Bertram Oakley,' 'Bertram Oak'.

'Come in!' snapped out Mr Weston, as a fresh tap resounded on the door.

This time it was Mr Crawley's ugly white face that darkened the doorway. Instinctively, Mr Weston snatched the folded newspaper that lay at his right hand, and placed it upon the paper on which he had scribbled the name of Bertram Oakley. Crawley, who noted the stratagem, smiled with the contempt of a superior scoundrel at the bungling effort to be secretive. But the smile was so merged in the deferential smirk which characterised the man, that Mr Weston did not perceive it.

'I hope, sir, that I have not kept you waiting too long,' said the confidential clerk humbly. 'Inspector Birch and I have hunted in couples, up and down, high and low, since breakfast, and not, I admit, with very encouraging results.'

'Ah!' exclaimed Mr Weston, brightening up. He was in the main a good-natured man, and, as such, was heartily glad when a painful duty was lifted off his shoulders. 'Yes, yes; needle in a haystack, and so forth, eh?'

'Until an hour ago,' resumed Crawley, with malicious emphasis—whereat Mr Weston's face clouded again—'when we were so fortunate as to find—not the thief—but the receiver, sir, of at least a portion of the stolen property. It was at a marine store, sir, kept by an old man of no good repute—Bond by name, in a place called Chimney Street, down by the waterside.'

'Ay, ay; a low neighbourhood,' chimed in Mr Weston with a nod.

'You may well say so, sir,' replied Crawley, rubbing his sleek palms together in a moist way. 'Many obscure nooks had we explored; but Chimney Street, I should consider, was about the worst and the vilest; and there it was that the Inspector's superior knowledge of the town, and, of course, superior aptitude for these inquiries, stood us in good stead. He it was who first espied, amidst a heap of unsorted rubbish, *this*, which bears our mark.' And Mr Crawley the confidential produced from beneath his loose coat a heavy fragment of broken brass-work, new and bright, and on which was stamped, in small letters, —vyn & Co.

'Part of a cabin lamp, or binnacle light, I should say,' pronounced Mr Weston, after a brief examination of the fragment.

'Of a binnacle light, I venture to think,' hinted Mr Crawley with extreme deference. 'And the Inspector, quick as detectives are to follow on a scent, suggests that since this has evidently been roughly separated, with a hammer or hatchet, from the apparatus of which it formed a part, the other portions may yet be found in the Fittings Warehouse, so that the identification—should!'

'I see,' returned Mr Weston magisterially, and perhaps he was meant to see. 'Where is the Inspector?'

'He is walking up and down near the gate, outside,' answered Crawley. 'We thought—or at

least the policeman did—that the sight of him in my company in the Yard might give the alarm to the suspected person, and so'—

'Quite right, and very prudent,' broke in Mr Weston approvingly. 'Bless me, what a sad affair! Where's my hat?' And he bustled out, Crawley following, with his evil leer and blinking eyes.

Near the outer paling was Inspector Birch, clean-shaven, trim, plump, and alert, with nothing about him to indicate his connection with the police—no semi-military surtout, no ponderous boots, rigid hat, or mahogany cane. You might have taken the man for a grocer in a small way of business, or an ironmonger's foreman, or even for an ex-butler, but neither for a constable nor for a spy.

'Servant, sir,' said the detective, touching his soft hat, of black felt, to Mr Weston—such a hat as inspires confidence, such a hat as a minor shopkeeper, who rarely has time to go abroad, may don when he dons his apron to leave his little account, or small parcel, at the door of a customer round the corner. Mr Weston, who was dull-witted if honest, would probably have preferred that his professional Mentor should be tight-stocked and tight-buttoned, a terror to evil-doers; but as it was, he trudged on with his two companions, at the policeman's request, to Chimney Street. An ill-looking locality was this—long, crooked, straggling, with its beer-shop, around the door of which wild Irishwomen—whose husbands and brothers laboured in the Docks—with unkempt black hair like horses' manes, and bare feet, brawled or gossiped noisily; with its blank wall of a smoky factory, its tumble-down tenements, its ragged children squabbling over dirt-pies, and its marine store, black-browed, beetling, rickety, and choked with heterogeneous lumber.

The name, inscribed in thin white letters over the frowzy doorway of this delectable shop, just beneath the clumsy feet of the squat black doll that dangled, like a hideous heathen idol of some degraded tribe of savages, from a projecting bar, was Isaac Bond. And into the presence of Isaac himself, sitting, or more correctly crouching, in his little back parlour, intrenched behind barrels set on end, and screened by a bower of red herrings that swung from strings suspended from the ceiling, did Inspector Birch, with the practised adroitness of a Palace Chamberlain, guide the way. It was dark enough among the stacks of empty bottles, the dilapidated red coats, and piles of tarpaulins, and ossuaries of bones, and heaps of metal, and kegs of kitchen-stuff; but it was darker in the back parlour, where the proprietor of all these unsavoury wares sat and smoked beside the red little stove-fire on which some onion-scented mess was greasily cooking.

'Now, Daddy Bond,' said the detective briskly, 'here we are again; and this is the gentleman who manages Messrs Mervyn's Yard, and who, as I told you by his authority, is prepared to pay for information; and is not disposed, provided he gets it, to press matters to any length as to unlawful possession, and that; so, as you know me, Daddy, and I know you, and we are all on a friendly footing here, why, we can't do better than come to an understanding at once.'

During the policeman's harangue, the proprietor of the shop had laid aside his long pipe, and slowly

coughing the while, and with some exertion, raised himself from his creaking chair, and now stood erect—or if not erect, at least as much so as a very tall and meagre old man, bent by age and rum and rheumatism into the shape of a half-hoop, and with limbs quaintly contorted and curved like the roots of an old tree, could possibly contrive to be. Such as he was, Isaac Bond, marine storekeeper, reared himself upon his slipshod feet, shaded his red-rimmed eyes with one gnarled hand, outspread, and silently surveyed his visitors.

'Ugh! gents and honest men all! I make ye free of your footing,' said the dealer in bones, rags, grease, and tarnished metal, hoarsely.

Mr Weston rightly conjectured this to be some barbaric formula of welcome; but did not speak at first, partly, perhaps, because of the awkwardness of commencing the conversation, and partly because his eyes, as well as nostrils, were affected by the smoky and malodorous atmosphere of this den.

'Now,' said the detective persuasively—'now, Daddy, nobody blames you, of course, because in carrying on your lawful business'—

'Ay, that's it, Mr Birch—lawful business—ugh, ugh! and a precious business, too, to scratch a living by, I can tell you. I'm worn to skin and bone for one, and don't make, some weeks, the price of a hot dinner on Sundays.'

'Is reputed to have saved a deal of money,' whispered the detective, aside, to Mr Weston. 'Don't be afraid—he's deaf;' and then, in a louder voice, continued: 'Well, Daddy Bond, since you, thinking no harm, bought this bit of brass, and maybe other things as well, which came from this gentleman's premises, you'll not object, I'm sure, to tell us how you came by them, and who was the seller. You can speak out, and trust to this gentleman's generosity to be rewarded.'

'Well, well, gents and honest men all,' replied Mr Bond, half-querulously, after a moment's pause, during which he looked at Crawley the confidential, and that pattern of head-clerks looked blinkingly at him, 'how can a poor old cove like me pick up a livelihood, if he don't get custom as he can, I'd like to know! So, when a chap comes to me, and he says, Here's a young gent has a lot of broken metal to dispose of cheapish, says he—and I'll introduce him, if you'll make it worth my while, and I'm to carry it for him to the wharf-end here, in my boat, says he, what could a poor old creature like me do, but speak him fair, and stand a quartern for luck! And he brings me the young gent, who seems desperate flustered, he does—and we come to terms—and I've not made a brace of sovs by it, clear, I'll take my'—

'What sort of person,' interrupted Mr Weston, 'was this young gentleman you speak of? Tell me what you know of him, and I will pay you for your trouble.'

'Well, master,' coughed out Isaac Bond, 'I don't know much, 'cept that he was a young one, and a tall one, with good clothes; on'y he was flustered—he was—ugh, ugh!—but there, we can't pick our customers. And I on'y clapped eyes on him that once. Always, afterwards, he sent word by the man that brought him, and brought the goods.'

'And his name?' asked Mr Weston.

'Name of Gooch—lodges up Friars' Alley,' answered the dealer in marine stores; nor could

any further information, even when chinking money was put into his wrinkled palm, be extracted from him.

'A bad business, Mr Crawley,' said the Manager, as they emerged from the shop.

'A treacherous business, sir. I feel it very much, I assure you,' replied the confidential clerk.

Inspector Birch being of opinion that, at such an hour, to beat up the quarters of Mr Gooch would be but labour lost, and pledging himself in due time to produce that euphonistically named dweller in Friars' Alley for extra-judicial examination, the next thing to be done was to pay the projected visit to the Fittings Room. It was after closing hours that the Yard was reached; but Mr Weston's master-key enabled the party to enter by a side-door. It was necessary to light the lantern which Mr Crawley's forethought had provided, before unlocking the warehouse. The storehouse, when inspected, presented a motley appearance of order and disarray. Quantities of valuable goods still stood, tier above tier, undisturbed. But many articles had been carried off, and others were lying strewn about in wild confusion. Some of the bulkier wares had been broken, to wrench away the more saleable portions, and on the floor lay a plasterer's hammer, which had apparently been used for this purpose. Near it was an object of small size, which the policeman was the first to discern.

'A card-case, eh?' said Mr Weston, as Inspector Birch stooped to pick it up. 'How came it here?'

'How, indeed!' murmured Crawley; and the general astonishment increased when the little leather case was opened, and the cards which it contained proved to bear the name of 'Mr Bertram Oakley.' The Manager and the confidential clerk exchanged glances that spoke volumes.

'You will take care, Inspector, of this—this piece of evidence,' said Mr Weston.

'Certainly, sir, as in duty bound,' was the reply; and as the searchers quitted the Yard, the Inspector, who walked last, softly whistled the Dead March in *Sul.* Once without the gates, they separated. Mr Weston, on his homeward way, stepped into the telegraph office, to address a telegram to Arthur Mervyn, Esq., Park Lane, London.

## CRAB GOSSIP.

WITH the crab-race, as represented on our shores, every reader is familiar. The common crab itself, exposed for sale in the fishmonger's window, may be called truly a 'common object' of the street, not to speak of the shore. Yet common as the animal in question is, there is a vast deal of natural-history romance bound up within the compass of its frame, and if we select this crab as a starting-point for our brief researches into some of its less familiar brethren, we shall not regret making its further and nearer acquaintance, especially as it illustrates some of the most important points in crab-life at large. To begin with its early history. This well-known crustacean has a somewhat peculiar life-history. It begins its existence in a decidedly abnormal and unusual fashion. Instead of breaking free from its egg—carried about by mater Cancer in her 'purse' in company with hundreds of its brethren and

sisters, likewise in the egg-state—the young or baby-crab appears on the stage of existence as a curious little creature with an enormous head, and a short, jointed, and forked tail. It is no more like the perfect crab than it is like an alligator. It more nearly resembles an abnormal shrimp on a roving expedition, than the staid angular crustacean whose progeny it is, and whose likeness—on the idea that 'like begets like'—we shall expect it sooner or later to assume. Its big head bears in front two great compound eyes, and is drawn out above and below into a long pointed spine; whilst two pairs of feelers, and three pairs of jaws complete the furnishings of this infant crab.

Behind the head, come at least two pairs of legs which will be represented in the perfect crab as 'foot-jaws,' and then succeed mere rudiments of six pairs of appendages, of which all but the first are represented in the adult state by the walking legs. The jointed tail, itself, has at first no belongings in the shape of appendages or ought else, but legs become mapped out at a later stage on the tail. Now when this young form was first noted by naturalists it was regarded as a new species of crustacean, and was accordingly named a *Zoëa*. Now, however, we know that the *Zoëa* shows evident signs of changing into something different from its youthful state. Its body becomes broader, and the limbs behind the head come to resemble those of the full-grown crab. Then the jaws are completed in their transformations, and by-and-by the young crab appears before us, a crab as to its body, but a lobster as to its tail. For it still retains this latter appendage, and is known in this second part of its life history as the *Megalopa*—a name signifying 'big-eyed,' in reference to the large eyes it possesses; which organs have now become fixed to the end of a stalk.

Like the *Zoëa*, the *Megalopa* stage of crab-life was at first regarded as representing a new and before unknown animal form. Changing its skin frequently, as it did in passing from the *Zoëa* to the 'big-eyed' stage, in which the crab looks more like a lobster than the tailless crustacean it is destined to become—the *Megalopa* or youthful crab begins to assume the full-grown form. The body becomes broader, and the tail grows 'small by degrees and beautifully less,' until it becomes tucked up under the body, and exists in matured crab-existence as the familiar 'purse' which children are so fond of prying into. Thus we see that a crab's body is, to put it popularly, all head and chest. The lobster or prawn has not merely a head and chest (united to form the so-called 'head' of that animal) but a tail or abdomen as well. And from the fact that our crab in its infancy possesses a tail, but afterwards loses this appendage, we should be inclined in a zoological sense to believe that the crabs represent a higher crustacean race derived from the lower lobsters or their kith and kin. At least, it is certain that lobsters and their kind were crawling over the rocks and swimming in the seas of this world's former epochs, ages before the crabs appeared. This much we know from the history of fossils. As the lobster-race preceded the crab-race in time, so the latter, as the later products of life-development, evince the higher structure of the two.

The disappearance of a tail in the crabs is by no means unparalleled in other groups of animals. Man himself, for that matter, possesses at an early period in his history a tolerably well-developed tail, which shrinks into the 'coccyx' or rudimentary bones at the tip of his spine. The frog begins life as a tadpole, but the tail of that form shrivels up to become the short and unrecognisable stump of the sedate frog. So that we find instances in higher life, bearing out the fact that abbreviation of body is by no means an invariable sign of deterioration and backsliding, but on the contrary may be more properly regarded as a sign of an animal's 'getting on in the world,' and rising in the scale of animated creation.

If, however, we wished for proofs of the high place of our crab in its own class as compared with the place of the tailed lobsters, we might discover such proof in an inspection of the crab's nervous system. A lobster's nervous system is a chain of nerve-knots lying along the floor of its body. Each joint of its body should possess a pair of such knots, either joined or separated. Now in a crab, whose nervous system likewise lies on the floor of its body, what strikes us as most remarkable is the concentration of that system. Instead of being a chain of nerves, the crab's system consists (1) of one big nerve-knot supplying the head-parts and organs of sense with nerves, and (2) of a very large knot or mass of nervous matter in the centre of its body. This last represents all the nerve-knots of the lobster rolled into one, and serves as a centre from which nerves pass to the surrounding organs and parts. In a word, on the principle that when a general wishes to obtain the fullest service of his troops, he concentrates them upon a given point, so Nature, in giving the crab a superior nervous system to that of the lobster, does not proceed upon the plan of manufacturing new nerves, but, on the contrary localises and concentrates those proper to the common type to which crab and lobster belong.

So much for our common crab and its history. One brief glance at its anatomy and development, has at least served to show us the position and rank of crabs in general in the crustacean class. The nearest relations of our crabs include some forms which may certainly be regarded as very abnormal in some of their ways and works. For instance, the well-known land-crabs of the West Indies are creatures which exist in damp places, and which make periodical journeys to the sea for the purpose of depositing their eggs. These 'up-country' species possess a structure essentially resembling that of the common crab; but the chief fact of interest in connection with them relates, of course, to their powers of breathing apart from water. The common crab is perfectly lively after a twelve hours' absence from his native element; and as he breathes like a fish by gills, placed in the sides of his body and attached to his legs, we must presume that he can retain in his gill-chamber moisture enough to purify his blood for a considerable period of time. For we must bear in mind that a crab's necessities of life in this respect, resemble our own. We require a constant supply of oxygen—derived from the atmosphere—to purify our blood; and the crab demands a supply of the same gas—derived from the water in which it is mechanically suspended—

for the same purpose of blood-purification. The crab's heart, placed on his back, is a square sac or bag, which goes on beating and pulsating, from first to last, circulating pure blood through his body. Cessation of breathing means, of course, stoppage of the heart's action, and consequent annihilation of crab-life; hence breathing, or aeration of the blood in the gills, must be as constant a function of crab-existence as breathing is in ourselves.

Now, it is evident that in the land-crabs, which live in burrows, there cannot exist that provision for blood-aëration by water, which is present in their neighbours of the sea. Hence, when we examine a land-crab's gills, we find that its gill-arrangements exhibit an adaptation to its own peculiar way of life. For instance, between its gills—lodged as these are in a very capacious gill-chamber—are found certain hard stiff processes, probably modifications of similar structures met with in the common crab and lobster. These processes are believed to possess the function of keeping the gills widely apart, so as to admit copious currents of air to the gill-chamber. If we presume that this air is moist, we can conceive how an animal with gills can therein obtain the necessary medium for blood-purification. But whilst moist air is a necessity for a land-crab's life, we must not neglect the all-important observation, that with new ways of life, nature has probably modified the land-crab's constitution so as to render its peculiar breathing habits more readily discharged. Nobody doubts that land-crabs were originally water-living in habits. The whole history of the Crustacean class points to that conclusion, and no other, as the original way of life of all its members. Hence, we learn from the mere fact of a land-crab's existence the ever-recurring lesson, that living things, like the world on which they dwell, have been and still are the creatures of change and modification. Habits alter, and carry change of body and form with them; and although this is not the whole story of diversity and variety in living things, it involves a large part of the 'reason why' that diversity exists and is perpetuated from day to day and from age to age.

The 'hermit-crabs,' those crustacean Diogenes of our coasts, each ensconced in a cast of shell for its 'tub,' are decidedly queer crabs in many aspects of their existence. Morally and mentally, so to speak, they are erratic. They are much given to sanguinary encounters, and are ferocious and vindictive enough, as may be seen when two hermit-crabs happen to light upon the same morsel of food. Then comes the tug of war; and the combat may only be terminated by the stronger dragging off not merely the morsel but the body of the vanquished along with it—the victim having pulled his tenacious rival out of his shell in the energy of his triumph. Hermit-crabs represent zoologically a kind of half-way house between the true crabs and the lobsters and their long-tailed neighbours. The hermit does not possess the well-developed tail of the lobster, but he can boast of a much superior tail to the crab. This tail, however, is soft and unprotected; so Pagurus, as the hermit is named, slips his appendage and body into the cast-off shell of a whelk or periwinkle; adheres to the shell by certain small 'feet' at the tip of his tail, and

defies the outer world at large when withdrawn into his abode, by placing the bigger of his two 'nippers' across the door of the shell and effectually closing the aperture of his domicile.

Amongst the near relatives of the hermit-crabs are one or two forms which deserve mention. Thus just as the land-crabs represent the terrestrial members of the Common-crab class, so we find in the West Indies a hermit-crab which likewise is a land-lover. This land-hermit creeps into the cast-off snail-shells, just as its sea-neighbour utilises those of the whelk, and has its breathing system modified for its land-existence. Then also, ranked amongst the hermits by zoologists, we find the famous *Birgus latro* or 'tree-crab,' also known as the 'cocoa-nut crab.' With its great pincers, this crab certainly smashes open the shells of cocoa-nuts, and exhibits in this operation not merely much dexterity, but great muscular power. Whether or not the crab climbs the trees in search of the nuts, is a moot-point. Exact observation is yet wanting here; but the facts of its vegetarian tendencies, and its dexterous manipulation of the nuts, are sufficiently notable points in the history of the *Birgus* tribe.

Space will hardly admit of our dwelling upon such 'queer crabs' as the little pea-crabs, which live inside mussel-shells and in the breathing sacs of sea-squirts, on the terms of friendly lodgers, if not of boarders as well. These latter are cases of animal association very difficult to explain. Nor can we do more than mention the curious glass-crabs which swim freely on the surface of the sea, and in which the body consists chiefly of two very flat, transparent plates, the front one of which bears the eyes, feelers, &c.; whilst the hinder possesses amongst its belongings eight pairs of limbs, and behind these again, comes the very short and rudimentary tail. The 'glass-crabs' only doubtfully claim from us a place in the list of 'queer crabs.' Good authority says they are most likely the young stages of lobster-like forms. If this be so, we may speculate on the time when, just as the *Zoëa* of old is now found in its proper place as the young crab, the 'glass-crabs' will have found their true place as the young of other crustaceans.

There are no more remarkable 'crabs,' with the mention of which we may bring this paper to a close, than the so-called 'king-crabs' or *Limuli*, of the Moluccas and West Indian Islands. Every museum contains specimens of these crabs, with their great broad horse-shoe-shaped 'heads,' and their long spinous tail, from the presence of which their name of 'sword-tails' has been derived. The 'king-crabs' are not 'crabs' in the zoological or ordinary sense of that word. They are very far removed indeed, from the ordinary crab in structure; and belong, so to speak, to a branch of the crustacean stem, distinct and separate from all the other branches. Looking at a king-crab, we are reminded mostly of the crabs of the past. Their nearest relatives are buried as fossils in the rocks of the far-back past of the world, and they therefore stand well nigh alone in the present array of crustacean life; although time was, when the king-crabs and their ancestors represented in themselves the aristocracy of the class. One set of extinct 'crabs' called 'Trilobites' in particular claims kindred with the king-crabs. The young king-crab is remarkably like these

fossil relatives. Hence we may conclude that as the old Trilobitic stock died out, the king-crabs as a later development remained to link a far-back period with our own times. The king-crabs are very peculiar in respect of their legs, of which there are some thirteen pairs in all, six of the front pairs surrounding the mouth, and curiously enough, serving to masticate and divide the food through the movements of their first or attached joints. The sword-tail is highly movable, and serves as a kind of lever to aid the animal in regaining its position when untoward circumstances have tossed it on its back.

The history of the crabs may be shown to teem with much interest even to the reader whose daily avocations lead him from zoological paths and by-ways. But the study of living nature is fortunately the exclusive property of no scientist, and belongs to no special age, sect, or school of thought. On the contrary, such studies in their freshness and variety appeal to all; and amongst the infinite diversity of subjects and the wide range of topics on which the seeking eye and understanding mind may alight, there are to be found many less instructive chapters, and few which, properly pursued, may lead to truer or wider notions of this universe, than the history of the crabs and their neighbour-kith and kin.

## TOM'S WIFE.

### CHAPTER I.

'WELL, sir, and what is the result of your inquiries?'

'Very favourable indeed,' I replied, as Squire Atheling, one of my oldest clients, sank into my own especial armchair and peered at me, inquiringly, from beneath the grizzled penthouse of his wrinkled brows. 'My agents in London have procured for me a copy of the late Mr Martin's will. The whole of his splendid property, with the exception of a few trifling legacies, is left unconditionally to the testator's niece, Christabel Martin, for her sole and separate use—that is, entirely free from the control or power of any husband whom she may have married or whom she may marry.'—

'Yes, yes; I know—I understand,' interrupted my client impatiently. 'Go on.'

'My agents have also ascertained,' I continued as I read from their letter, 'that the testator's property was in due time realised; and after the settlement of all claims, a balance of forty-five thousand pounds became payable to Christabel Martin—then widow of a Monsieur Favre, a French officer who was killed at Sedan.'

'Precisely so,' assented the Squire. 'It is just as she told me.'

'Inquiries have been made,' I resumed, as the old man once more gave me his attention, 'by my stockbroker, who, by a fortunate coincidence, happens to be the one employed by Madame Favre's solicitors, in pursuance of her wish, in the investment of this large sum; and they state that the different stocks and securities purchased by them for her, still stand in her name, the dividends and interest being remitted to her regularly every half-year.'

The Squire rubbed his thin hands together and gave a pleased chuckle as I finished. 'Eh,

Woollaston,' he exclaimed; 'a nice little nest-egg for a young widow free from encumbrances! Confess now, you are curious to know my motives for all these inquiries, eh?'

'It is for Tom,' he cried, as I admitted the impeachment.

Tom was the Squire's son—his only child. He had just entered his twenty-sixth year, and was a fine specimen of what the son and heir of the lord of the manor should be. He was a proficient in all the sports and pastimes of a rural life, and had a fair knowledge of farming and agriculture. His frank, good-humoured nature had won for him the good-will of all who knew him; while many a bright eye flashed and fair face flushed their testimony to the young Squire's good looks, as he rode through the village on his stont roan mare. His bright blue eyes, golden-brown curls, and fair complexion—though tanned to a darker hue by the sun—all bespoke his Saxon origin. Without being unduly extravagant, Tom was sufficiently liberal and open-handed to afford a pleasing contrast to the somewhat parsimonious and miserly proclivities of the Squire. His easy, good-tempered disposition enabled him to steer clear of many a threatening collision with the far less compliant temper of the latter; but behind the winning frankness of his smile, there was a look of sturdy, manly determination, that required but the occasion to bring it into action.

'For Tom?' I asked, as the Squire's shrewd twinkling eyes showed that some scheme, advantageous to his own interests, was being hatched in his plotting brain. 'How is Tom to become possessed of this nest-egg? Is he going to marry the wealthy widow?'

'Bravo, Woollaston!' cried the Squire, with a half-sneer. 'Your wisdom has actually discovered the secret. Yes; Master Tom is to become Madame Favre's husband number two. It will be a capital thing for him. She is young, good-looking; and an early life of poverty, before she inherited her uncle's wealth, has taught her economy. Yes—she knows the value of money, and will be a good check on the lad, who has a tendency in the opposite direction. And then, just think what an advantage to me and to the estate. I shall be able to save the allowance that I now make to Tom; for the income from her property will be more than enough for them to live on.'

'And what does Tom say to it?' I asked, for I was cognisant of a certain romantic episode in his life which might raise difficulties in the fulfilment of his father's wishes.

'Say to it! What should he say to it?' he asked with an ill-disguised contempt. 'I haven't told him yet; but he'll know better than to say no. Tom is a discreet lad, Woollaston. He knows on which side his bread is buttered.—No; you need not alarm yourself. There'll be no difficulty with him; and Madame Favre must be hard to please if he can't win her; for Tom's a likely fellow with the lasses.'

'But supposing he refuse,' I suggested; and as I spoke, a cruel, hard look came over the old man's shrivelled face and glittered in his cold, unfeeling eyes, that bespoke a relentless determination, if his will should be thwarted. 'Trust me to deal with him,' he said in grim tones, as he added with a cynical laugh: 'Your fears are

groundless, Woollaston. He likes comfort and ease too much to oppose himself to me, when poverty—miserable, biting poverty—would be the result; for I—I would discard him for it. Yes; I would cut him off with'—

'How did you meet with this fortunate lady?' I asked with covert irony, and anxious to lead the conversation into a less unpleasant channel.

'I met her at Fécamp, where that dolt-headed doctor sent me for my health; but I don't grudge the expense, since it is going to bring me so good a return. I was out walking one day,' he continued, 'and she was a few yards in front of me. I should not have noticed her, had not a savage-looking cur attacked her. I drove the brute away with my stick; and her gratitude for my protection made her rather friendly with me. We met several times afterwards; and she told me who she was and all about herself, her youth of penury, and then her uncle's unexpected legacy. She had been married only a few months when her husband was killed in battle, and she was left a young widow, unencumbered, and with a noble fortune of forty-five thousand pounds in good and sound investments, in addition to the small pension that I suppose she would receive from the French government as an officer's widow. I at once saw what a capital wife she would make for Tom; and as she was now impatient of the retirement in which she had lived at Fécamp since her widowhood, and was thinking of purchasing a house in England, I invited her over here, and have placed the dower-house at her disposal—you know it is just vacant—while she looks about her. Rather skilful diplomacy, eh? Your inquiries satisfy me that her fortune is safe. Yes; she is a fine woman, and so you'll say when you see her. She ought to be here by now. She was to arrive by the noon train. Perhaps I shall meet her. I wish Tom were here to go with me.'

Buttoning his coat across his chest, the stooping and weather-beaten, but still hale old man picked up his ivory-handled stick, and taking leave of me, marched from the room. I heard him pass through the outer office and into the street, as the clattering of a horse's hoofs smote my ears. Raising my eyes from the musty law tome into which I had been diving in search of an abstruse point of law that was puzzling my brains, I saw, through the window, that the horseman was young Tom Atheling on his roan mare. He stopped when he saw his father; and the old man stood on the side-path talking to his son as, with one hand, he patted Wheatear's graceful, glossy neck. The Squire was in a good humour, for he was pleased with himself; and as he laughed at some joke that Tom appeared to be telling him, a look of paternal pride and, perchance, affection—for even the hardest shell may hold a sweet kernel—lighted up the harsh lines and curves of his astute, hard-featured countenance. The cackling sounds of his chuckling laugh, mingling with the merry peal of Tom's full-toned joyous voice, reached me as I sat watching them. Just at that moment the solitary 'fly' that the village possessed, drove by. It had but one occupant, a lady, dressed in the deepest mourning. She raised her veil as she passed, and I saw that her face was wondrously fair and beautiful. 'Madame Favre!' I exclaimed to myself, as she inclined her head gracefully to the Squire,

who eagerly responded to the salutation. With gentlemanly courtesy—although a stranger to her—Tom raised his hat, and met the tender, pleading glance of her who, perchance, would prove his destiny, and seal his earthly career for good or ill, as the record of fate might have decreed for the house of Atheling.

## CHAPTER II.

To explain a romance of which I believed Tom to be the hero, it is necessary to dip into the archives of the past. When Tom was about to enter his teens, a widow lady and her only child, a daughter of about eight or nine years of age, came to reside in a small house named Rosebank Cottage belonging to me, that stood about a mile from the entrance to Atheling Park. They were evidently in poor circumstances, and the small rose-embowered cottage had apparently been chosen more on the ground of economy than as a desirable residence; for although picturesque in appearance, it was very lonely, being situated some distance from the village, and also away from the high-road. They appeared, however, to live very happily; and a friendship was soon established between the pretty little black-eyed, gipsy-looking brimette and Master Tom, who was in the habit of riding in that direction to and from the school at the neighbouring market-town where he was being educated. Many a half-hour did he loiter away, while his pretty little playfellow had a scamper on his pony's back, heedless of the flight of time and the master's ominous frown and threatened birch; and amply rewarded by awakening the sancy, happy laugh of enjoyment that rang so joyously from his little comrade's lips, and her mother's pleased words of thanks as she saw the bright looks and rosy-tinted cheeks of her darling.

Time crept on, and Tom returned from college to find his little child-mate, Jessica, a beautiful young woman, in whose presence he felt as shy as she apparently felt bashful in his. But he was pained by the altered looks of the mother; and his dire apprehensions of an approaching calamity soon received a fatal confirmation. Before many months had passed, Death had claimed her, and Jessica was now an orphan. Her only relatives were some friends of her mother's who resided in Paris. They came forward in her trouble, and generously offered her an asylum with them; which Jessica thankfully accepted. The evening before her departure, I was returning from a day's shooting, through a small wood near Rosebank Cottage. As I approached the house, the clouds rolled from the front of the moon, and before me I saw Tom Atheling. Poor little Jessica was clinging to him, and tears were glistening on her pretty cheeks as he held her to him. Then, as his love-enraptured face was pressed to hers, I slowly retraced my steps, and sought another and more distant path, rather than break rudely upon their happy young dream. My withered old heart had once known its romance, and the mystic melody was ever ready to sound at the touch of sympathy.

To return to my narrative. The next morning, after Madame Favre's arrival, I was sitting in my office, expecting a visit from the Squire, who had made an appointment with me about some matters relating to one of his leases, when

a messenger arrived from the Hall, asking me to go there, as the Master was prevented by a slight cold from coming to me. Several things detained me during the morning, and it was not till after luncheon that I was free to attend to the message.

When I arrived at the Hall, I was at once ushered into the picturesque old dining-room. The remains of the mid-day meal were still on the table, at which Tom was sitting with an unwonted flush on his handsome face. The Squire also was apparently labouring under some excitement, for his brow was knit, and his mouth was twitching with ominous portent. Yet, how well their two figures matched with the appointments of the room! A wainscoting of richly carved oak covered the walls and the ceiling, which—with the upper half of the wainscoting—was divided into panels, on which had been painted a series of pictures of the chase; the age-blackened wood, with its elaborate carvings of fruit and flowers and trophies of the hunt, forming a rich and quaintly fantastical frame to each time-mellowed specimen of the painter's skill. Tom, with his stalwart form clad in the hunters' pink, looked as if he had stepped forth from one of the pictures; and his father's thin, spare, but dignified figure, as he leaned forward in his large, old-fashioned chair, and with a black velvet skull-cap crowning his snowy hair, but added to the completeness of the scene.

'Perhaps you may be able to instil a little sense into this son of mine,' the old man began, as I entered.

I was about to make a reassuring reply, for I could perceive that I was approaching troubled waters, when Tom interposed. 'Had we not better stop the discussion, father?' he said in a quiet tone.

'Stop it? No!' shouted the old man angrily. 'I will have it settled now, once and for all.—What have you to say against Madame Favre? Nothing. Most young fellows would think themselves only too lucky to get the chance of wooing and winning a young and lovely woman with nearly fifty thousand pounds in her pocket. Bah! I've no patience with such folly.'

'I know nothing of Madame Favre, father,' said Tom, 'save what you have told me. But, as I have already said to you, it is out of my power to become a suitor for her heart and fortune.' The almost unconscious stress that he laid on the latter word, showed the contempt that he felt for the bribe for which he was asked to sell himself.

His father interrupted him impatiently. 'Tush, boy!' he cried, stamping his stick angrily on the ground; 'you've told me a cock-and-bull story—some entanglement that you have got into with some wretched girl. But what do I care for that? Woollaston, I daresay, will soon make that straight for you; for I'll be bound she's no better than she ought to be.'

The hot blood rushed over the young man's face at the insult implied by his father's words and tone, as he brought his clenched fist down on to the table with a ringing blow that made the china and glass shiver and dance. 'Father,' he cried in passionate angry tones, 'how dare you utter such an unfounded slander! I will not listen to such words—not even from you. That wretched girl, as you call her, is as sacred to me as if she

already were my wife, which she shall be before many weeks have passed over my head, so help me!'

'Hush!' I cried, as I stayed the utterance of the holy name that was on his lips. 'Not that, my boy.—Be calm. Remember that you are speaking to your father.'

'Ay—and he *shall* remember it,' came from the Squire's thin bloodless lips, as he turned his cold gray eyes on his angry son. 'Begone, sir, from my presence! No child of mine—though he be but my only one—shall use such language to me with impunity. Begone, sir; and never darken my doors again till you have learned the respect due to a father, and are prepared to accede to my wishes.'

Tom rose to his feet, and his face paled at his father's words. Like most of his high-spirited temperament, Tom's anger, once vent had been given to it, quickly died. 'Do you mean it, father?' he asked in a wistful, reproachful voice, as he turned his warm, loving eyes to his. Tom was a tender-hearted, affectionate fellow, and I knew, must feel his father's conduct a blow that was hard to bear. He might strike in anger, but not in revenge. The implacable spirit of the old man, however, was cast in a different mould. He screwed up his eyes, and pursing his lips together, sat as if no one had addressed him. Tom waited a moment, and then he said: 'You will shake hands, father, before I go—will you not?' He advanced a step towards him and held out his hand. 'Come, father,' he cried with manly spirit, as the Squire still sat with unmoved countenance, 'don't bear malice. I am sorry I cut up rough and spoke disrespectfully; but I could not keep quiet when you spoke so unjustly of one who is so dear to me. I'm not going to ask you to take me back. I have a fair amount of brains, and I daresay I shall have no difficulty in making a home for myself and -her.' How brave and hopeful his young voice sounded!

But the hard old man, whose life's affections had been blunted by his accursed thirst for gold, had no echo within him to the appeal thus made; hence he ignored the outstretched hand, turning his head away so as not to see it.

With a sigh, Tom left the room. I waited patiently for some signs of relenting; but the grim, hard-featured face was immovable.

'Ungrateful boy!' at last was the muttered exclamation as we heard the sounds of Tom's footsteps dying away in the distance as he crossed the flooring of the old hall on his way to his rooms to prepare for his departure. 'And after all the money that I have spent on him too!' continued the old man in a regretful tone. 'I only wish I had it all back again!'

No wish for the return of him who was the sole pledge of her who, now wrapped in the slumber of Death, had once, perchance, been as much to him as his now so greedily hoarded gold.

The Squire quickly, however, recovered the appearance at least of equanimity. He abruptly changed the subject; and for the next two hours, we devoted ourselves to the dry details of business. I watched him curiously, for the betrayal of any signs of feeling; but apparently, all was dead within him. His attention to the subject we were discussing was closer than mine; for I was feeling saddened and shaken by the scene that I had

witnessed and been powerless to prevent. Almost unconsciously, I was cogitating in my mind a plan for the reconciliation of father and son, when the Squire brought our discussion to a sudden end. 'There!' he cried, thrusting away from him a paper relating to one of his farm-leases; 'upon those terms, I will grant a renewal of the lease; and if there is any objection to the increased rent, I shall have no difficulty in finding others who will accept my conditions.'

Feeling that the interview was at an end, I rose, and began putting on my gloves. Suddenly, the sound of wheels in the front of the house made the Squire turn to the window. My eyes followed the direction of his, and, as he held himself back, I saw that it was Tom in the dogcart, at the back of which were placed a big portmanteau and a railway-rug. A large and favourite retriever rushed out to follow him, and began barking and leaping about the horse's head. Tom leaned down from his seat and, affectionately patting the animal's head, called to the groom to take him back to his kennel. The man having done so, returned; and then, with a gentle flick of the whip, the mare started forward down the long elm-flanked drive that fronted the Hall; and still the old man stood watching the retreating figures. After about a quarter of a mile, there was a bend in the avenue. As Tom reached it, he turned his face for a last look at the old roof-tree that had sheltered his ancestors for so many bygone generations. The last rays of the setting sun played through the tall branches of the trees, and, as the discarded light disappeared from view, the bright rays faded, and the cold wintry wind, with a melancholy whistling sigh, caught the last leaves of the dying Autumn, and sent them rustling and whirling to the ground.

Did no tender feeling awake within the father's breast as his boy—his only child—went from his sight? Was it fancy; or did the cold gray eyes glisten with a strange, unwonted emotion, as the sound of the distant wheels died on our ears?

'He will come back—and obedient to my wishes,' murmured the now childless father in a low and slightly husky voice. It seemed to me that the words were uttered more as a set-off of bravado for the temporary softening influence that had crept over their utterer, than because he had faith in them; and as I mournfully wended my way homewards from the silent house, I hoped that, though the shell was very hard, the kernel might not be quite withered, and that there might still lurk some sweetness in its shrivelled folds.

#### LIFE IN NOVA SCOTIA.

NOVA SCOTIA is most appropriately named. It is similar in many respects to Scotland, though its area is little more than half that of the old country. It possesses large pine forests; has many lakes and rapid rivers; hills nearly equal in altitude to the highest in Scotland; and a climate which, although warmer in summer, is yet in winter covered with snow, much as in North Britain. The traveller who visits Nova Scotia, usually lands at Halifax, the chief town, or city as it is termed, which is provided with a splendid harbour not unlike that of Plymouth. On the left, as you

enter, there are eminences some two hundred feet above the sea, on the summit of which is a fort, termed York Redoubt. On the right is a lovely wooded island termed McNab's, on which there is also a powerful fort; and a third fort on a small island in the middle of the harbour. Halifax is located on the left side of the harbour; whilst opposite to it is the pretty little town of Dartmouth. The shore on the Halifax side is provided with a number of wooden wharfs, so arranged that the sidings offer every facility for small vessels, steamers, &c. to discharge and receive their cargoes.

The town of Halifax is not imposing. With few exceptions the houses are constructed of wood, and are small and mean-looking, especially near the landing-place. The streets are ill-paved and dirty; and although there are numbers of men who apparently have no means of subsistence, and poverty is indicated by their appearance, yet such manual labour as clearing the mud off the streets in wet weather, or removing large stones from the middle of the roads in dry weather, is rarely employed. Here and there, we find well-built stone or brick buildings, belonging to some of the leading merchants; then, probably next door, a tumble-down wooden hovel. The whole place has a look of patchwork about it. It is, moreover, badly drained; and the consequence is that diphtheria is very prevalent, whole families of children being frequently carried off by this preventable disease.

The most beautiful part of Halifax is that termed the Western Arm, where an estuary of the sea runs inland about two miles, and is about half a mile broad. On its banks there are villas with gardens sloping down to the water, and possessing a south-west aspect. The rise and fall of the tide is rarely more than five feet; and the sea-water is clear and blue, as it is off Madeira.

Halifax is well supplied from the surrounding country with every necessary in the way of food. The beef and mutton are as good as in England; whilst poultry, butter, eggs, and vegetables are plentiful and cheap. An excellent market on Saturday enables the country-people to dispose of their farm supplies. This market is an interesting scene. First you see the stolid Scotch emigrant, with a cow and calf for sale, or some turkeys and fowls, vegetables of all kinds, or a load of hay. Next him may be seen the Miamae Indian with his squaw, disposing of fresh eggs, butter, and cream. Then, again, a thorough negro, a descendant of the liberated slaves, with a large basket of beautiful ferns; or some baskets made by themselves, and filled with wild strawberries, raspberries, or some of the numerous other edible berries that grow wild in profusion; for Nova Scotia is the land of wild fruits.

The climate of Nova Scotia, although very fine, is yet peculiar. From about the middle of November till about the early part of April, the climate is almost arctic in its severity; during

January and February the thermometer often falls to ten and fifteen degrees below zero. Snow falls in abundance, and the soil is ice-bound. During May and a part of June, the weather is objectionable. Fogs, damp winds, and steamy weather prevail. The melting of the snow and ice causes the country to be soft and muddy, and it is then unhealthy. By the end of June, fine weather sets in; and spring, then summer, rush, as it were, to make up for lost time. In an interval of a fortnight, the climate changes, and becomes almost tropical, the thermometer running up sometimes to above ninety degrees in the shade. The nights, however, are invariably cool and pleasant. Vegetation progresses with equal rapidity; flowers come to maturity, and plants pass on to the development of leaves, in as many days as it occupies them weeks in England. From August to November—called the 'Fall'—the weather is lovely—fine clear warm days, mild nights, and a fresh feeling that is enjoyable.

The soil in Nova Scotia is very fruitful; and little manure is required. Everything grows rapidly and well, and the necessaries of life consequently are abundant. Cattle, pigs, sheep, and poultry thrive, and can be obtained at prices far less than those paid for the same articles in England. The sea on the coast of Nova Scotia abounds with cod, haddock, mackerel, smelt, and other kinds of small fish. In a few hours, any amateur with a hook and line can catch pounds-weight of fish. Lobsters and oysters are also plentiful. A regiment which arrived at Halifax intended giving a lunch, and considered lobster salad an essential. One of the messmen was sent down town to buy a pound's-worth of lobsters. The man obeyed his orders, and returned with a cask containing about one hundred! The retail price for a fair-sized lobster is ten cents—about fivepence; but when bought wholesale, of course are cheaper. Oysters are found on the coast, of excellent quality; but the best come from America. There are no finer oysters in the world than those termed Silver Stream and Shrewsbury. They are about the size and shape of English Natives, but finer in flavour; and as they are fresh from the sea and not mewed, they possess the true oyster flavour. A barrel of these oysters can be purchased in Nova Scotia at the price of eightpence a dozen.

About the middle of November, winter sets in. The cold is guarded against by putting up double windows to the houses, using large hall stoves termed 'base burners,' which are so constructed that they feed themselves with fuel when properly loaded, and consequently burn all night without being attended to. By opening or closing small apertures in these burners, the heat can be regulated, and the halls and passages kept at any required temperature, varying from fifty to seventy degrees. A particular kind of coal termed 'hard coal' is required for these stoves. With these precautions, a house is always pleasantly warm, although outside the thermometer may indicate ten degrees below zero.

As soon as the snow and ice period set in, the winter amusements begin. Sleighs with their jingling bells take the place of wheeled vehicles. Omnibuses have their wheels unshipped, and 'runners' take their place. Snow-shoes are made ready, and snow-shoe clubs arrange their meetings. Skates are sharpened, fur coats and caps taken out from their camphor-guarded boxes, and preparations set on foot to make the best of five months of snow and ice. The rinks in Nova Scotia become the daily resort of those who have no special business to attract them elsewhere, and skating in its most perfect style is then seen. Each year, one or two carnivals take place on these rinks, and they are scenes to be remembered. To see gathered together some four or five hundred ladies and gentlemen in fancy dress, all first-class skaters, winding and twisting, yet rarely colliding, is an exhibition only to be witnessed in a country where the people are nearly as often on ice as they are on solid ground.

The water in the rinks is frozen solid, and in the following manner. About six inches of water are first let in on the flooring; when this is frozen solid, a few more inches of water are let in, and frozen; and so on, till about two feet of solid ice are in the rink. When a thaw takes place, the water on the surface of the ice is pushed off by india-rubber scrapers, and the ice is still good. Consequently, long after it has ceased to freeze out of doors, skating under cover is practicable.

The amount of snow-fall varies considerably during different years. During some winters, snow covers the ground from December to April, and sleighs are used without interruption. In other winters, the snow lasts only a few days, and then disappears. When this is the case, the roads are very bad, as sleighs cannot always be used, and wheels sink deep in the soft ground. Plenty of snow is considered a blessing during a Nova Scotian winter.

One of the most exciting amusements during the winter is 'tobogganing.' A slope of considerable length is selected, either the side of a hill or a road; on this the toboggan is placed, and consists of a couple of thin planks fastened together, turned up in the front, and shod with 'runners.' On this toboggan, two people usually sit, and glide down over the snow at a pace that rivals an express train. Sometimes six or seven people will travel down on one large toboggan; and by using a leg as a sort of rudder, the toboggan can be steered to a nicety.

In the matter of sport—in every lake and river, trout can be caught, similar to the trout in England; in some few lakes, grayling also can be taken. Some years ago, salmon were plentiful in every river in Nova Scotia; but although game-laws have been framed by the government of Canada for the protection of salmon, and also for the preservation of game, these laws are practically useless. The destruction of salmon is being rapidly accomplished in Nova Scotia; and during last year, salmon was as rarely seen on any table as venison is on that of the working-man in England. The principal cause of the destruction of salmon is reckless netting and spearing, and also the fact, that the sawdust from mills is allowed to pollute some of the finest salmon rivers.

Spearing salmon is a favourite amusement of the poacher, and is accomplished in a manner

similar to what used to be called 'burning the water' in Scotland. A canoe or flat-bottomed boat is used; and at the head and stern, a piece of birch bark is blazing. The canoe is then gently pushed over the pools at night; and when the water is clear, the salmon can be distinctly seen lying near the bottom. The spear is about ten feet long, has a barbed point, and a fork of wood, which is so shaped that it opens when the fish is struck, and then closes round it. By this means, the whole of the salmon in the pools may be either captured, or so badly wounded that they die. If the salmon were some terrible enemy whose extermination were desirable, no more effective method could be practised to insure its destruction. Of course the law forbids spearing; but either from disinclination, shortsightedness, or incapacity, it is not efficiently carried out. Consequently, at present it is only by paying a large sum for a river, or visiting the most out-of-the-way localities, that even fair salmon-fishing can be obtained.

The sport for which Nova Scotia is famous is moose-shooting. This sport, however, is dying out; and before long it will probably be extinct. The moose is the largest of the deer tribe, and stands, when full grown, seventeen or eighteen hands high. It is a denizen of the large pine forests and swamps, and is rarely seen in the open except when alarmed and retreating. There are three methods of hunting the moose, which are at present allowed. The first and most popular is 'calling'; the second is 'creeping'; and the third is running the moose down, when the snow is deep. The calling commences on the 15th September, and is practised in the following manner. The sportsman selects some Indian of the Micmac tribe as his assistant who is a good caller; provides himself with a stock of provisions; takes a second Indian as a camp-keeper, and travels to some part of the country where it is reported moose have been seen or their tracks are abundant. Having formed the camp, the sportsman starts about two hours before daybreak to some elevated position, and where he can obtain a good view round. The Indian has peeled a strip of bark about a foot long from a birch-tree, and has rolled this into the shape of a frustum of a cone, to form the 'call.' Standing on a rock or small tree, the Indian then calls through his trumpet, giving an imitation of the call of the female moose for her mate. This call is repeated at intervals of five or ten minutes. If a bull-moose be within hearing, he will come straight to it until within one or two hundred yards. He then gets cautious, and waits listening, or tries to circle and get to leeward of where the call came from. Sometimes he comes on recklessly to within a few yards of where the sportsman is concealed; and if not then shot, it is the fault of the hunter himself. Late in the evening and early in the morning are the times selected for calling. There is a certain amount of excitement about this method; but to the thorough sportsman it savours of poaching.

The next plan requires greater skill and perseverance, and is that usually practised by the solitary Indian. The moose, during the daytime, remains quiet in the woods. Previous to selecting any locality as his resting-place, he walks round in a circular course, the diameter of his circle being about a mile. Having by his keen scent discovered that there is no danger, he then walks

into the centre of the circle, and either feeds or lies down. The Indian coming across this trail, follows it, and forms usually a very good idea of where the moose is located. He then creeps through the forest, peeping in all directions; and at length, if successful, gets a shot at the animal. The best condition for this creeping is immediately after rain, for then the leaves on the ground being wet, do not crackle when trodden upon. Also if a strong breeze is blowing, the noise made by the branches of the trees conceals any sound made by the Indian creeping through the forest. When the snow is two or three feet deep, and the surface has been thawed and has then frozen again, the moose is at the mercy of the hunter. The animal, from its weight, breaks through the thin crust of ice, and is consequently impeded in its movements; its legs also get cut by the broken ice; whereas the hunter, on his snow-shoes, skims over the surface with as much ease as he would over a lake on skates. The moose, consequently, is run to a stand-still, and shot.

Unfortunately for the hunter, the moose, in addition to being very wary, is also very scarce. It is not an uncommon thing for one or two good sportsmen to travel some two or three hundred miles to their hunting-ground, to pass three weeks in the forest, to expend thirty or forty pounds each, and fail to see a single moose. There is very variable luck also in moose-hunting, as the following fact will prove. Two hunters had been out during a fortnight in a likely moose district; they had each day walked twenty or thirty miles in the forest, but had not seen a moose; consequently, they gave up trying, packed up their camp equipment, and started for the farm from which they could drive to the railway station. When within a mile of the farm, they came face to face with a bull-moose which was feeding near the road, and there shot him. Moose-flesh is excellent eating; it looks like beef, but has the flavour of venison.

During September, the time when the moose-hunter is out, the woods in Nova Scotia are lovely. The maple, birch, and other leaves change to all the colours of the rainbow. The lakes, which abound in the country, are pale blue in colour, and reflect the crimson, yellow, pink, and green colours of the forest trees. The climate is also charming; warm by day, and just chilly by night, with occasionally a slight frost; the sweet scent of the spruce-trees, the fresh air one breathes, and the exercise, being excellent restorers of health.

Nova Scotia offers a fine field to the hard-working agriculturist with a small capital. The soil is very fruitful, and the necessities of life are easily procured. Land is cheap, and wood abundant. The coal-mines of the country are almost inexhaustible; and gold is found in nearly every part of the country. There are few countries in the world where the emigrant is likely to suffer less either from the climate or from the want of the necessities of life; but it is not a country in which a rapid fortune is to be made, except by successful trade or some lucky chance. As yet, however, it is a young country. Capital is required to bring out many of its hidden treasures. Gold-mining alone, if properly worked, would form one important source of occupation for thousands; whilst farming for home-produce would

always bring a fair remuneration; and consequently, Nova Scotia ought to be better known than it is, and its advantages more appreciated.

### SOME CURIOSITIES OF REPORTING.

It would be manifestly unfair—as we have on former occasions admitted—to credit the compositor, who has quite enough to answer for in respect of his own misdeeds, with all or even most of the curious and ridiculous things that appear in our newspapers. A very considerable share of these is traceable to the editorial, sub-editorial, telegraphic, and reporting departments; and the last-mentioned source has proved as prolific as any of the others, if not more so. It would not be easy to name any sphere of literary work in which there is greater scope and opportunity for bungling, and in which a man's capabilities may be more readily gauged, than that of the newspaper reporter. Of reporters as a class, it may be said that they are on the whole capable and intelligent men, who fully appreciate the responsibilities of their office, and conscientiously endeavour to discharge their onerous functions in a thorough and business-like fashion. Yet in this as in all other professions there are to be found careless, inexperienced, and incompetent persons, whose inefficiency is inevitably reflected from time to time in their work.

In the course of an introductory lecture to his students, the late Professor Hodgson on one occasion remarked that the economic world was 'a chaos of discordant and conflicting atoms, with only a superficial and deceptive resemblance of peace.' What must have been the feelings of the Professor when he found next morning that one of the newspapers had made him speak of the economic world as 'a chaos of discordant and conflicting *demons*!' In this instance, the word 'atoms,' which in phonography somewhat resembles 'demons,' was so translated, having been imperfectly written.

A much more extraordinary series of blunders which had occurred in the same way—that is, by the misinterpretation of shorthand characters—appeared some time ago in a Glasgow paper. The Rev. Fergus Ferguson was the victim on this occasion; and he, in the course of a second letter to the Editor on the subject, says: 'The report was, in all essentials, as remarked in your note, and already admitted by me, a reproduction of the opening passages of the lecture, followed by a correct outline of the whole. But, in support of the suggestion I have made as to the origin of the mistakes, I may say that "exhibited" occurs twice for explicit, "doctrines" for documents, "nations" for notions, "invaluable" twice for infallible, "unions" for communions, and, in a very important passage, "good" for God.' It is but fair to the inventor of phonography to say that only very bad or careless writing could have led to such an exhibition of inaccuracy.

Imperfect hearing is a common source of error. In a report of a Roman Catholic festival in Dumfries some years ago, where there was a good deal of noisy demonstration, a reverend Father was repre-

sented as having appealed to his hearers whether they should longer be degraded by the presence of 'the triangle' in Rome. It was the presence of Victor-Emmanuel to which the reverend gentleman objected; and the mistake can only be accounted for by a misapprehension on the part of the reporter, in consequence, no doubt, of the rapid articulation of the speaker and the enthusiastic response of the audience. It was probably under somewhat similar circumstances that a temperance orator was made to speak about getting farther and farther from the 'Land of Promise,' when he was only deploring retrogression from the 'van of progress.'

Reports are liable to be rendered misleading or absurd in the process of condensation. A large proportion of our public oratory is exceedingly 'spongy,' and easily 'squeezed' into the required compass; at the same time it is often necessary greatly to condense speeches and lectures, almost every word of which, were space available, would be worthy of reproduction. In such circumstances, the reporter must exercise his discretion and ingenuity in reducing into the most concentrated form the opinions and statements with which he has to deal. It would not do to dismiss the oration, as an American paper recently did a lecture on Ireland's miseries, with the words—'It is too long to report and too good to condense.' An intelligible account of the matter must be given, though 'in a line,' as the editor's instructions frequently are. There may, however, be such a thing as condensation overdone. Perhaps the funniest instance of this on record is one which occurred in a report of the inauguration of the Bruce Statue at Lochmaben, in the autumn of 1879. On that occasion, a vote of thanks was awarded to the Rev. William Graham, Newhaven, for the part he had taken in promoting the statue, and in acknowledging the compliment, the reverend gentleman quoted the lines:

I've travelled east, I've travelled west,  
E'en dreamt I've been in Eden;  
But Bruce's birthplace takes the gree;  
There's nae place like Lochmaben.

This was spoken in the open air, amid tremendous cheering, and with an involuntary pause at the end of every line. One of the reporters, curiously, failed to recognise the poetic form of the words, and selecting this as the most remarkable part of the speech, not only wrote it out in the form of prose, but summarised it, and gave it in the third person. It accordingly appeared as follows: 'Mr Graham, in responding, said he had travelled east and west, and had even dreamed he was in Eden; but Bruce's birthplace took "the gree"—there was no place like Lochmaben.' (It may be well to explain that the Scotch phrase 'takes the gree' signifies unequalled.)

Sometimes a report is incomplete because the reporter has not succeeded in procuring the necessary information, or, for some other reason, is unable to accomplish his task. It is seldom, however, that one comes across such a refreshingly candid confession as that of the gentleman who concluded his report of a banquet with the statement—'It is not distinctly remembered who made the last speech.' This recalls an account of the speech of the evening at a Burns Anniversary Dinner, which stated that 'the cloth being

removed, after a very excellent dinner, the Chairman addressed the meeting for ten minutes, in a strain of eloquence so overpowering that there was not a dry eye in the room; and though several skilful shorthand writers were present, not one of them seemed inclined or felt it possible to attempt the exercise of his art. The impression of this speech will be long felt; but it is impossible by an effort of memory to give any conception of the enthusiasm, feeling, and glowing expression evinced on this occasion. Without in the least disparaging the Chairman's oratory, one can hardly restrain the suspicion that something still more overpowering was responsible for the loss to the world of this panegyric on the poet.

A good story is told about the banquet given by the Corporation of London to the Prince of Wales, on his return from India. It was arranged that the gathering, which was to be one of great splendour, should take place on a Thursday evening. A London penny-a-liner thought he would write an account of the banquet for the metropolitan newspapers. Failing to get a ticket of admission, he was neither defeated nor discouraged. With a fertile pen and an uncommon power of imagination, he sat down and prepared his narrative. Not satisfied with producing an ordinary paragraph, he wrote a comparatively long report. He began by describing the procession from Marlborough House to the Guildhall, the cordial greeting and tumultuous cheering of the crowds that lined the streets, and the personal appearance of the Prince and Princess of Wales. His capacity for descriptive writing was not exhausted here. Other important figures in the group that gathered round the Lord Mayor's board were elaborately drawn, and an astonishing power of detail was expended on the more prominent statesmen who sat on the right and left of the civic dignitary. Special care was taken with Lord Beaconsfield, who was described as pale and worn out, in consequence of a severe stress of work mingled with anxiety. Lord Derby, Sir Stafford Northcote, and the First Lord of the Admiralty were also portrayed with more or less exactness; and the Lord Mayor and Lady Mayoress had the full benefit of a graceful and easy pen. A minute account of the magnificent decorations was also given, the knowledge of flowers manifested in the description being almost equal to that possessed by any gardener. The proceedings were then reported in detail. First, of course, came the toast of 'The Queen,' followed by the playing of the National Anthem and the other customary loyal toasts. Then came the Lord Mayor's speech in proposing the toast of the evening, in which the remarkable social and genial qualities of the Prince of Wales were referred to, and suitable allusion was made to the great advantages which His Royal Highness must have derived from his visit to India. A brief philosophical dissertation followed respecting the immense blessings which the visit had conferred upon the Indian people, and, finally, a peroration on the prospective advantages of the journey in building up and cementing our noble Indian Empire. All the usual 'hear, hears' and 'loud cheers' were carefully inserted. Equally detailed was the reply of the royal guest, the Prince himself; while the toast of 'Her Majesty's

ministers' and the reply of the Earl of Beaconsfield were likewise written out at considerable length. Other speeches were briefly summarised; and some account of the closing proceedings and the music brought the report to an end.

This ingenious fabrication was so cleverly executed that the deception might not have been discovered had it not been for one simple but fatal mistake. The reporter thought the banquet was on the Wednesday instead of the Thursday evening. About eleven o'clock, therefore, on the former night he sent the report to several London and provincial newspapers, in some instances carrying it himself. The amusement the affair occasioned in the newspaper offices that night may be imagined. The unfortunate journalist was not seen in that neighbourhood for ten months after, and it was believed that he had entirely deserted the profession. Of late, however, there has been some reason to fear that he has resumed his old practices. If this suspicion is unfounded, it can only be said that his mantle appears to have fallen upon some no less gifted adventurer in the field of romance. How otherwise are we to account for the following letter, which a member of parliament had occasion to write to the *Daily News* in December last?—'Sir, in the *Daily News* of to-day there appears what purports to be a report of a speech I addressed to my constituents at Dunfermline last night. I think it right to state that it is a pure fabrication. Had it been merely an incorrect report, I should not have troubled you on the subject; but although it follows the sequence of my topics, I cannot recognise a single sentence as my own, but from beginning to end the words and phrases are the creation of some one else. In proof of what I say, I beg to inclose a copy of a fairly accurate report, which appears in the *Scotsman* of to-day.'

Ignorance and carelessness on the part of reporters have led to some very amusing blunders. 'Fratricide at Haddington' was the title given some time ago in an Edinburgh paper to the case of a man who was tried for the murder of his father. An American reporter once transformed the quotation, 'Amicus Plato, amicus Socrates, sed major veritas,' into: 'I may as Plato, I may as Socrates, said Major Veritas.' The next morning's feelings of the orator to whose words this extraordinary rendering was given may be more easily imagined than described.

It was a Welsh reporter who headed a paragraph—'Suicide of Two Persons—Statement of the One that Survived.' This seems more like a product of the sister isle, and if the writer was not of Hibernian birth or extraction, he might at all events claim affinity in genius. The erroneous use of the word 'other' has occasioned many a curious blunder. A Scotch paper recently announced that 'a man named Alexander Buchanan, and two other women,' were charged with assault.

Nothing is more ridiculous than some of the attempts at fine writing, resulting usually in pointless euphuism, indulged in by some young, eccentric, or would-be eloquent writers for the press. Mr T. A. Reed, in his *Reporter's Guide*, cautions youthful aspirants against this snare, and points out the absurdity of saying that 'Sol's effulgent rays illumined the scene with unaccus-

tomed brightness,' instead of simply recording that the sun shone brightly. As Mr Reed observes, however, such bald simplicity would be too much to expect from a young and ardent 'contemporary historian.' Singularly enough, these flights seem to occur more frequently in descriptions of the weather than in almost any other connection. This was how a poetic youth wanted to inform the prosaic world that there had been a fall of snow: 'The angels rustled their wings at the hour when Aurora goes forth to fulfil her mission, and the earth was covered with a fleecy mantle of white.' But the editor quietly dropped it into the waste-basket, and wrote instead, 'Snow fell this morning.' Here is an example, from a country paper, of the ambitious style of a weather paragraph: 'After a long period of unsettled weather, it must have gladdened every one yesterday morning when the sun, with all his glorious brilliancy and splendour, shone forth, with golden ray scattering cloud and mist, and with his cheering beams and glowing smile causing the birds to sing, the trees of the forest to rejoice, and the flowers of the field to unfold themselves in bright array.' It was also a country brother who thus began a paragraph announcing the sudden demise of a local shoemaker: 'We are being constantly reminded of the inexorability of Death—the certain, and it may be sudden visit of "the angel with the amaranthine wreath," as Death is so beautifully designed by Longfellow; and it is our painful duty to-day to chronicle the melancholy fact that one who had played his part, and played it well in life, has passed through Nature to Eternity.'

The reporter is often blamed by speech-makers for condensing their orations. A reporter, responding to the toast of 'The Press,' told his hearers that they were often much more indebted to the representatives of the press for what they left out of their reports than for what they gave; and there was a great deal of truth in the remark. By reproducing all the silly and childish things that are said at public meetings, reporters might, if they chose, make the speakers appear in a most unenviable light, while by judicious condensation they almost every day make presentable, and even telling, speeches which, as spoken, were incoherent, rambling, and, it may be, ungrammatical. The reporters in the Legislative Assembly of New South Wales recently dealt with one of the members in a way which ought to act as a salutary warning to him and other too exacting orators. This gentleman, angry at the abridgment of his speeches, joined with others in demanding that full reports should be given; and the reporters accordingly granted his desire, printing several of his subsequent orations verbatim, to the great amusement of the public, and the mortification of the member himself.

Reporters as a rule are persevering men, and like to give good value for their services. A good story is told of Lord Palmerston's experience of importunate reporters. A London scribe having heard that his Lordship was to be present at an archery meeting in a small country village in Hampshire, posted down to the place and attended the meeting. Lord Palmerston's task was to distribute prizes to some half-dozen blushing young ladies, and the whole company present did not number much above a score.

His Lordship performed the task with his customary grace and good-humour, giving the young ladies a kindly pat on the head, but making only the most commonplace observations. The reporter waited anxiously in his place until, to his horror, he saw the proceedings brought to a close without any formal speech from the Premier. This was more than he could stand. He rushed from his corner to the noble Lord, who was passing out of the room. 'My lord, I beg your pardon, but really this won't do.'

'What do you mean?' was the reply of the astonished statesman.

'Why, you've made no speech! I've come all the way from London to report it, and I must have a speech of some sort.'

Whereupon, it is on record that the good-tempered old gentleman turned back, and detained the retreating audience for twenty minutes, while he gave them a genial dissertation on the good qualities of English women in general, and of Hampshire lasses in particular.

#### SEAWARD.

THE long surf whitens up the bay,  
Fringing the yellow sand with pearl;  
And tremulous the rippling spray,  
Sway to and fro, and dash and curl!  
They whisper softly to her feet  
Who lingers lonely on the sand,  
Still looking seaward, with her sweet  
Dark eyes overshadowed by her hair.  
Her loosened hair is backward blown,  
And brightens in the noonday light;  
And the fresh landward breeze has thrown  
Soft colour on her cheek's cold white.

Is it to watch the sea-bird shoot  
On sunny wings above the foam,  
She lingers with reluctant foot,  
All lonely from her cottage home?  
Is it to watch the waters fret  
And toss their snowy spray high and free,  
Her tender long-lashed eyes are set  
So often to the windy sea?  
Is it to mark the archway hue  
Where the deep heavens and ocean meet,  
The golden melting in the blue  
So softly, that she stays her feet?

There is a bark with snowy sail,  
And pennon fluttering in the wind,  
Bright foam about her bows, a trail  
Of broken waters far behind:  
She leans before the breeze, she flies  
Bird-like, with pinions widely set:—  
And now in seaward-looking eyes  
Heart-weary shades no longer fret.  
Sail on! fair bark, amid the spray;  
Sail on! and safely shoreward run:  
Break on, soft ripples, up the bay;  
And know, sweet maid, thy vigil done.

## FILLING LITTLE PITCHERS.

IN TWO PARTS.—PART I.

'LITTLE pitchers have large ears,' says the proverb, as a warning to talkers. Why is not there another proverb to put old folks on their guard about the talking specially meant for small pitchers—that is, little folks—to hear. The proverb might be, 'Little pitchers have narrow necks.' Very narrow, indeed, are their necks, though they stand up straight, and mostly open wide-tipped at the top, as if eager to be filled. In shape they are not unlike the vessel pictured in the old fable-book where the crane asks the fox to dinner. They are fragile vessels too. It is a law running through all Nature, that what is finely organised is easily spoiled, and that whatever is most delicately beautiful is also most perishable. Now, this law applies to the little pitchers, and it makes the filling process a dangerous one. Yet they have to hold something, or they are of but little use. Somehow, they must be filled wholly or in part; some one must manage to do it; and something good must be put in them, even though it be but a few drops.

How, then, are they to be filled? How fast, and how far, and with what? Some people are content with pouring in a little—slowly, gently; but most people have a different idea of the duty and capacity of little pitchers. They are in a hurry to show them off brimful all at once. They turn on a strong tap of knowledge, and grasp the slender little thing tight under the deafening torrent—most of which is only pretending to go in, and surging out again, and dashing over the sides. Or else they try to produce a supply of prodigious pitchers, by mustering them in crowds, and discharging the precious liquid in volleys and volumes, a bucketful at a time. A grand quantity is discharged, but very little is retained. And it is well for those weak little pitchers if the shock does not send some of them rolling over, spilling half what they had already, and leaving them chipped and fractured, to stand up patiently

for more perhaps, but never again to be so fair and perfect, even in the glory of being brimful, as they might have been in simple soundness and half-emptiness. But worse than this. There may be some one—poor prodigy of a little pitcher!—smashed by the fall, under that douche of water that could not go down the narrow neck; or if it be not ruined yet, it may be cracked so that it must break asunder soon in the world's wear and tear. And when once it has had such a fall as that, not all the king's horses, nor all the king's men—no, nor all the pitcher-fillers and pitcher-menders in the kingdom—can set it right again. They may patch it and cement it, and it may hold together long enough then in a quiet corner; but be it known to them all that when the poor little pitcher was so beautifully and lovingly made, it was not made to be broken; it was to have a noble use because a real use in the world, though perhaps a very simple use.

Let us, then, keep in mind our proverb, 'Little pitchers have narrow necks,' and ask, How are they to be filled? How fast? How far? With what?

First of all, how fast? That depends entirely upon the capacity of the vessel—the natural ability of the child's mind; and there are not two of them alike. Very rapid pitcher-filling is, for instance, to be found in the Life of John Stuart Mill. As a young child, he had an amazing aptitude for serious learning, and his father had an equally amazing determination that he should learn. The boy passed direct from babyhood to student-life; he seems to have tumbled out of the cradle into the classics. 'I have no remembrance,' he wrote, 'of the time when I began to learn Greek; I have been told that it was when I was three years old.' He began Latin in his eighth year, having read by that time a host of Greek authors, some of which he avows it was impossible to understand. As to English reading, at that mature age he had already gone through a whole historical library, including Robertson, Hume, Gibbon, some volumes of Rollin, Burnet, Watson, and Hooke, Millar's Historical View of

the English Government; and much more. But was he a child at all? And who could have chatted and played with a seven-year-old wisecracker?

Five-year-old scholars of a very different sort are to be found peopling the little ones' gallery in any of the Board schools. Compulsory education snatches these pinafores from their mud-pies and doorstep convocations. There is a kindness, even though a hard kindness, in thus gathering them in out of the city by-streets, or placing them for the best hours of the day in airy rooms and by warm winter-fires, in exchange for their greater freedom in the foul air of close-unhealthy rooms with cheerless hearths in winter. But how the new regimen and the awful heights of infantile study must stagger the courage of these wee scholars! Think of the whole alphabet rushing upon them all at once, a confusion of hieroglyphics and of disconnected sounds, with the future prospect of being expected to decipher pages where the letters seem to unaccustomed eyes too small and close to be rightly seen. How little children ever learn to read, is one of the greatest mysteries in the world, as the almost natural familiarity of deciphering not letters but the sequence of ideas at a glance, is one of its grandest wonders. Pity the five-year-old scholars, then, in their stupendous difficulties, and don't keep their quicksilver spirits too quiet, or hurry their lessons too fast. Let them sing their tables, and refresh them with the blithe ballad of the Cock-sparrow, before passing on to give them their first lesson in the great art of putting two and two together.

And here may be the right place for a word about the Kindergarten system, and also about the custom of teaching by means of games. The object lessons of the Kindergarten plan are excellent for little children; it teaches them, too, in various ways, ornamental and useful, to do simple work with those little hands, which open first upon the world only able to clutch and hold like a pair of polyps, or as unwieldy for use as a couple of little pink starfish. It is a great thing to teach little children to use their hands dexterously, even in putting together toys, or working with coloured wool, or copying simply with a pencil. Another task, still better, is to teach them to use their voice. Beside the perfection of the voice in speaking, we have to think of the development of the voice as an aid to health. Just as the senses develop with practice, and the muscles increase with exercise, the lungs—on which the security and long lease of life often depend—are strengthened and developed by use. It is well known that singing, instead of wearing out the lungs, strengthens the chest; and the singing voice—a great gift in itself—often depends on the early use of the lungs and throat. A quiet, silent, subdued child will rarely have roundness and strength in the later singing voice, though sweetness and compass there may be, the quality of the voice being independent of the force of the sound. The most notable illustration of voice-develop-

ment is in the theory that Italian babies become Italian singers because the mother so often goes out to her field and vineyard labour, leaving the baby to keep house, hanging swathed and bagged against the cottage wall, and most likely developing its lungs for an hour or two before she comes back. But in teaching children, it must be borne in mind that if it is wrong to suppress outdoor shouting, it is also an injury to the voice to allow much outdoor singing with the strain of the wide open air, or ever to permit singing notes to be shouted. All singing, kept within moderate bounds, and not too loud, will be found to develop the compass of the speaking voice, and naturally to give it that soft roundness and those ever-varying tones which save speech from monotony, and constitute the lively quality of a pleasant voice. Beyond all this, there is the task of perfecting the pronunciation. Many young children have, for instance, a defective utterance of the *s* and the *r*, and however pretty their infantile failures may sound, it is cruel to their after-life to let the lisp and the baby language grow in a few years into a confirmed disadvantage of speech. Other children in large schools have to be cured of vulgarities and provincialisms in the sounding of the vowels.

We have dwelt upon this point of the training of the voice for two reasons: partly, because we are conscious that large as the School Board curriculum is growing, correct and distinct pronunciation of our own language seems hardly to be included; partly, because there are many children of wealthy parents who lisp in French before they are able to pronounce the *s* and the *r* of their mother-tongue—a most foolish want of training, for in a few years the inability to sound an *r* will make their French itself unintelligible. Speaking of schools for the people, and the advisability of perfecting the distinct pronunciation of the national language there, we may add that it has often struck us that the three *R's* ought to be increased to five. Respect and Reverence—are not these worthy to be taught as carefully as Reading, Writing, and Arithmetic? The correct sounds of their own language, the gentleness and respect which we count as a part of mutual courtesy, the simple reverence which in these days is too often forgotten—we have often felt painfully that these great things are in the background, while room is made to teach less necessary things to the children of our working classes—the future mass of the nation.

As to the custom of teaching various branches by means of games devised to fix them in the memory, we can only say, that a musical game or a spelling puzzle, a floral lotto or a dissected map, may teach their wisdom well enough to little children, but they will always amuse rather than teach; or if they do not, the children will turn to another play instead. Any system of play-lessons, however much it may instruct for the time, leaves the greatest lesson of all untaught. This great

lesson has a long name, but it is unconsciously learned in school-days by very little children.—it is Self-discipline, the power of application to duty, the training of the will to turn naturally to the work of the hour, because it is the duty of the hour, letting pleasure wait till after. Big children in after-life learn soon enough that work is not play, though their cheerful energy and willingness in its performance, turns that duty into pleasure. This is one of the unconscious lessons learned in childhood; and in that little picture of the great world, we see the children who enjoy the work of lessons enjoying play too in its own time, and in both cases growing stronger in that duty-doing will, which is one of the greatest treasures that boy or girl can carry into manhood and womanhood.

But if lessons be work, pure and simple, there is no reason why they should be dull work, too hard work, or unprofitable work. The lessons are often so very hard, the examinations so terribly tough, that their very play-time has an air of wet-day recreation. For heaven's sake, let the children have as happy a time as they can, and preparation as pleasant, so that they may bring brave cheery hearts with them into this crowded upper school of ours. Let there be a laugh now and then to lighten the lessons—a few moments of an anecdote, to fix wandering attention; let the teacher stoop down to the child's level, and see from that low point of vision the difficulties higher sight cannot see. Above all, the schoolrooms meant for the poorer classes should be bright, and their lessons attractive, not too dry and not too weighty for those small wayfarers, who tread such rough paths in life already outside the schoolroom walls, and who will have such burdens to bear by-and-by.

We say above, let not the lessons be unprofitable work; and this hint mostly applies to a higher class of little scholars. Children who begin very early to learn from books, and who at first learn rapidly and brilliantly, are apt to wear out their energy in a few years; and for the most part we observe that the most steady and lasting success is gained by children who are not hurried through hard studies in the nursery, but who begin their book-lessons later, and pursue them without haste, after a healthy state has been secured for mind and body by the first years of play and rest. There is also in such cases a zest for work, a longing for lessons which carries the little student with its hearty impetus far on into the school-life that was delayed until it was wished for. When the school-life comes, there is too often unprofitable work given as fuel to all this delighted energy. Minutes of the history of ancient empires are ambitiously attempted, before children know the commonest facts about the empires, republics, and monarchies in the world of to-day. They are required to know the genealogy and rights not only of every Saxon and English king, but of his sisters and his cousins and his aunts, before they know the general features of England itself as in a broad bright picture. We have known a curly-haired, rosy, little student, in her first year at school, breaking her head and heart over learning out of a book the unpronounceable names of Russian geography, while she was still blissfully unconscious of what divides us from America, or what the words Great Britain exactly

meant. And we have heard the wailing from fever of a bright girl, far too earnest-hearted in everything she touched. Recollections of the striving for an English history prize had mingled in a tell-tale way with her rambling talk, and she laughingly explained it: 'You must know, there was the king of England, and the king of France, and the emperor of Austria, and they wanted to carry off mamma and kill her; so there was a great war all over the house and everywhere; and I used to be so afraid the king of France would get mamma in the battles.'

This set us wondering what the whole orderly arrangement of nine or ten centuries of battles, kings, and genealogies, had to do with this child; how much of it would remain in her memory. No doubt, some of the information which is contained in school-books sinks into the mind, and remains to form a foundation for future reading; but ninety-nine drops out of every hundred must certainly gush out again when such taps of knowledge are turned torrent-strong upon such slender necks. Perhaps, as to the speed of filling, the golden mean will be struck by not beginning in haste, and always going slowly and surely. *Hurry slowly* is a wonderfully wise maxim, and in filling the little pitchers it is an invaluable rule. The time of childhood is beyond a doubt precious for learning; but let us go quietly, carefully, never fast, never roughly. The pitchers that are best filled are filled by those who hurry slowly.

In this filling process, there is sometimes a terrible douche given all at once, shattering the frail little vessel. Those who make the mistake forget that the child's mind must receive food for study in a certain fitting progression, because there is a progressive development of the child's faculties. First comes the memory, then the imagination is brought into play—that rich imagination of the young mind, unfettered by reason. Later comes understanding in its fullness, and the reasoning power. When little children learn fragments of verse and listen to stories, they are exercising two of their strongest qualities of mind—memory and imagination. Afterwards, many a worthless school lesson becomes valuable as a memory exercise. Countless names and dates that make the lesson hard, will be utterly useless in themselves; but in another way they are useful, in moderation, as practice for the memory; and no faculty grows by practice so fast and, we might say, so luxuriantly as memory. The reasoning power is awakened by helping the child to understand the reading of books and the meaning of the simple verses already learned. If any poetry-loving child were questioned about the sense of well-known verses, most amusing misconceptions would come to light. We ourselves were once for a long time under the impression that heaven was invoked in verse to cast away 'the captain's fethers,' having at that happy age some idea of what a captain was and a feather, but the vaguest idea of slavery or of 'captive's fetters.'

Another way of developing the reason is by the study of grammar, grammatical analysis, or by intelligent talks about history. Arithmetic is to childhood for teaching exactness, what logic is to manhood; but higher mathematics coming down suddenly and in force upon the bright realm of imagination, risks the great loss of driving out the

imagination and stunting the sensitive and poetic parts of the mind. Have we any poet who was such a mathematician as our schools expect to produce in dozens moulded out of one mould?

Again, the filling of little pitchers with hard facts, ignoring imagination, is very apt to break them. We all know how Mr Gradgrind ruined his little pitchers; and how did he begin? He allowed them no progress. He began with reason, and condemned imagination. They had the circle of the sciences open to them, and were trained in mathematical exactness. They got lessons in political economy, instead of story-books, statistics instead of pictures. They were strictly forbidden to wonder; they had little to wonder about except the dullness of their life and the hardness of the tables of 'stutterings.' 'Teach these boys and girls nothing but facts—you can only form the minds of reasoning animals upon facts; nothing else will ever be of any service to them,' said Gradgrind's system of ruin. In the excessive cramming that goes on everywhere, there may be a survival of this doctrine of hard facts. We have only time to allude here to one great and hard fact that underlies our whole argument about filling the little pitchers gently and slowly, and that is, that the age of mental study is the age of physical growth; and we all know about a certain living dog that was better than a dead lion.

So next, let us ask, How far should these little pitchers be gently filled? Need they be brimful? And with what?

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER XXXIX.—THE ACCUSATION.

MR WESTON rose early. He had passed but a restless, miserable night, with snatches of uneasy sleep and troubled dreams. The evening before, he had partaken of dinner without appetite, had been morose to his wife, snappish with his daughters, everything that a kind-hearted man of business wishes not to be, but sometimes is, for no fault of his or of those of his own household. And Bertram Oakley was at the root of all this. We are all strangely fanciful, even those of us who pride ourselves the most on the practical steadiness with which, in blinkers of an approved pattern, we do our allotted task upon the tramway of the world. Oddly enough, never had Mr Weston liked Bertram so well—never had he so thoroughly realised the brightness and the winning nature of the young fellow, as when he feared that the strong proofs against him would bear him down. 'The pity o't!' he could have cried out, with Othello; and it did seem a pity.

Mr Weston had made up his mind. He would do the honest thing, take the straightforward path. The youngster had sat at his table, had been greeted with friendly confidence by his wife and daughters. Not even for the sake of Mervyn & Co. would he first communicate with him through the medium of the police. Face to face, he would tell him how bad and how black things looked. If the lad could clear himself—why, thank God! If not—well, well! Messrs Mervyn must decide

as to the punishment. Mr Weston therefore started for the Yard far earlier than usual; and when Bertram arrived, he was requested at once to step into the Manager's office.

Bertram, by the cloud on Mr Weston's brow, by his constrained manner, by the very fact that his superior did not hold out his hand, but employed it in nervous readjustment of his papers, saw at once that something was amiss.

'Nothing wrong, I hope—no one ill?' he asked, nervous himself, for there is something contagious in all sincere emotion.

Mr Weston, dull, if well-meaning, misconstrued Bertram's agitation. 'Nobody ill, I thank you,' he said stilly; 'but wrong; yes, Mr Oakley, you have guessed right there. Something is wrong. Nothing could be worse, I should say. The thief from outside is a mere vermin preying on society. But what shall we say to him who robs under trust?'

'Do you mean, sir—has anybody?'—Bertram wonderingly began.

'The Fittings Warehouse has been robbed, systematically, as it seems, of costly and portable property, to the value of a thousand pounds, or more,' said Mr Weston, beginning in a low tone, but speaking in louder accents as he warmed to his work. 'The thieves were evidently familiar with the place, and entered by means of a key. Now, you, Mr Oakley, have one key, and I have the other, of a complicated and difficult pattern, as you know. Now, Mr Oakley, I think it right and fair to tell you that we have learned the name of the rascally old dealer in marine stores who has bought a portion of the stolen property, and that of the fellow who negotiated the sale of it; that the Fittings Room has been searched by Mr Crawley and myself, in company with a police Inspector, and that the detective himself picked up there a card-case containing cards of yours, and supposed to have been dropped'—

Mr Weston may have said more, but Bertram did not hear it. A noise as of the waves of the sea was in his ears, and his eyes grew dim; and he was faint, sick, giddy, and, reeling back, leaned against the wall for support. At last he became conscious that the Manager was still speaking, and the words 'confess'—'young, and liable to temptation'—'clemency,' rang on his dulled sense of hearing. Then Bertram, by an effort, rallied his strength, and pale still, but almost calm, walked up to the Manager, who had half risen from his chair.

'Mr Weston,' he said, in a voice that was broken by emotion, do what he would to steady it, 'your words have given me great pain, and greater surprise. Had you stabbed me, the shock could not have been more cruelly unexpected. I am conscious that you meant well and fairly by me, when you— But, can it be that you, sir, that any who knew me, could have believed me for a moment to be the robber of my benefactor, to have stung the kind hand that gave me bread? I have been a poor boy, sir, a lonely lad, without kindred or a home, but no one ever suspected Bertram Oakley before this day.' His face was in a flame now, crimsoned by the sudden flush of warm indignant blood; and he looked so handsome and so full of frank courage, that the Manager began to feel uneasy doubts creep over him, and was rendered thereby even more unhappy than

before. That Bertram should be guilty, had cost him a pang. We none of us like to think worse of human nature than we can help, and Mr Weston had been sorry, and almost ashamed, because of Bertram's supposed sin.

But if the lad were innocent! The Manager it was who, as this thought passed through his brain, felt his own eyes quail before those brighter eyes that sought them, not as those of delinquents do. 'I have felt this—very much,' stammered out the Manager. 'We all thought so highly—think so still, if only— Why, but two days ago— But never mind that. If you can clear yourself, Bertram, I shall rejoice as if my own son had been in such a scrape and come out of it. But,' added Mr Weston, with a sorrowful shake of the head, 'circumstances, I must say, tell terribly against you.'

'They do so, sometimes, as I have read, against innocent men—more often, no doubt, against the guilty,' replied Bertram, in his calm, deep voice, which even to his prejudiced auditor seemed to speak in Truth's own accents. 'Will you excuse me, sir, if I crave time to think the matter over, and if I forsake my duties for the moment?—You need not fear, Mr Weston, that I shall seek a disgraceful safety in flight,' he added; 'I have nothing to conceal, and shall be found when wanted.' And without another word, he turned away, and walked from the Yard and from the bustling neighbourhood of the Docks, his head bent, and his eyes on the pavement, and neither noticing nor returning the salutations of the few acquaintances whom he encountered. Suddenly, as he passed by the police station, the windows of which were decorated, as usual, with handbills in fat black type, offering rewards for absconded clerks, fraudulent bankrupts, and undetected burglars, Bertram made up his mind as rapidly as we all of us do, now and then, under the pressure of excitement. He had meant to go back to his quiet lodgings, and there to think; but now he felt as though such meditation were superfluous, and resolved to act. Unhesitatingly he crossed the threshold. As he did so, he remembered his last visit to such a place. That had been at Blackwall, when he sought to save his employers' property and to prevent the river pirates from capturing the *Golden Gate*. Now, he was himself accused of blackest treachery and most cowardly crime! He smiled bitterly—he could not help it—as he entered the Superintendent's little den.

'We have only one detective just now off duty,' said the commandant of the petty fortress civilly, in answer to Bertram's inquiry—'Inspector Birch. You'll find him, sir, in his room, across the passage.' And indeed there sat the Inspector, writing, at a chipped table, with a stand of brass-hilted cutlasses fastened to the whitewashed wall over his head.

'Inspector Birch, I am told?' said Bertram quietly. 'My name is Bertram Oakley, the Assistant Manager at Mervyn's Yard.'

Inspector Birch winced and reddened. Our circulation is not under our own control, and even detectives can blush; but as he motioned Bertram to a chair, he looked at him with professional keenness.

'Now, Inspector Birch,' said Bertram, as quietly as before, 'I have no wish to waste your time, or to trespass on your patience. We will leave

feelings, then, for the moment alone, and attend to facts. Somebody is guilty—that is clear—of the robbery which has been committed at our place of business. And it is equally clear that I—who am wrongfully accused—am not the robber. Mr Weston has just told me, for the first time, of the suspicions against me, and of the discovery of the card-case.'

'Then Mr Weston is'—The detective did not complete his summary of Mr Weston's character, but whistled instead a bar or two of a popular tune. 'It's hardly fair upon the Force,' he said presently, in a deeply injured tone—'hardly fair, to spoil a case that way.'

'He has told me about it, at any rate, and from kind motives, I am convinced,' resumed Bertram, with a gentle but weighty manner which impressed the policeman in spite of himself; 'and the first use I make of the information is to come to you. Now, Mr Inspector, you must have had some experience of such affairs. Look into my face. Is it the face of a thief?'

'By George!' exclaimed the Inspector, with a sharp rap of his hand on the ink-stained table in front of him, 'we're on the'— But he checked himself before he had quite uttered the words, 'wrong scent, after all,' which had been trembling on his lips, and merely coughed awkwardly behind his outspread hand. 'Can't judge by looks,' he said grudgingly, but with a crest-fallen air. A good bloodhound does not like to be at fault, or to track the wrong quarry. Now, the Inspector had had excellent opportunities of observing the behaviour of very many criminals, when taxed with their crime. It was all very stale to him, the passionate grief, the fi-brille anger, the eloquent appeals to heaven, the false oaths, the whimpering of some, the coarse attempts of bolder knaves to brazen it out. His acquaintance professionally did not lie much among the innocent, whom he had usually noted to be hot, flustered, speechless, and far less plausible than the guilty. But he had never met with an accused person who bore himself as Bertram did.

'Circumstances, as Mr Weston said, are suspicious,' Bertram went on to say. 'That card-case which you picked up, for example, and which is mine'—

'You admit that, sir?' asked the Inspector. 'Though I am bound to remind you that whatever you say may be used against you.'

'Use it, then, and welcome!' answered Bertram, with a patient smile. 'I lost it, as nearly as I can remember, a fortnight ago; but certainly not in the Fittings Store. Now, Inspector, if you will hear me for a while, I have something to propose which will entail no dereliction of duty, no betrayal of trust, and which will profit me nothing, unless, of course, I should have guessed aright. Now, listen.'

And then there ensued a conversation, in low, hurried accents, between Bertram and Inspector Birch, in which at first, of course, the former took the lion's share, though presently the policeman's voice might be heard speaking in a subdued tone, but evidently with an unfeigned and eager interest. Had the busy Superintendent, penning letters and filling up forms on the opposite side of the passage, been capable, like Bluebeard's latest sister-in-law, according to the lamented Bishop Heber, of listening at the door, scarcely an intelligible word would

have reached his ears except: 'Not a word, then, to Mr Weston,' and, 'For to-night, then.'

'Too good, too good for an amateur,' grumbled the Inspector, as he stood on the worn doorstep of the police station and watched Bertram as he walked away. 'I feel humbled, somehow, that the first idea didn't come, as it ought to have done, from the Force. But anyhow, it stands for to-night.'

### HEAT AND HEALTH.

WE have somewhere read of a system of cure in which the only means used was heat. The principle upon which this system was founded had an appearance of plausibility. It was expressed in a sort of motto: 'Heat is life—cold is death.' Hot substances, such as ginger, Cayenne pepper, &c., were prescribed for internal use. Hot baths of various sorts were applied externally. While it is well known that extremes of heat, no less than extremes of cold, are destructive of both life and health, it may well be admitted that a moderate administration of either might be beneficial in many cases. It is on a modification of this principle that hydropathy is based; not, as for a time misnamed, the *Cold Water Cure*. Water of various degrees of temperature, and air as high as two hundred degrees Fahrenheit, are employed, according to the effect desired.

There can be little doubt as to the advantage of a due amount of heat, so far at least as the preservation of health is concerned. And in cases where health has been interfered with through defect of heat, a supply of heat in proper degree must be beneficial. And it may even be allowed that, under certain circumstances, an extreme degree of heat may be used with advantage—as in the case of the Turkish bath.

When a person swallows a dose of Cayenne pepper, or enters the hot-room of a Turkish bath, he experiences the effects of artificial heat. When he partakes of a meal of ordinary food, or exposes himself to the rays of the sun, the heat he derives from either source is natural. The combustion of carbon in respiration, and the burning of coal in the furnace of the bath, are very similar processes, both consisting essentially of the chemical combination of oxygen gas with carbon. Stephenson termed coal, 'bottled sunshine;' and the same may be said of Cayenne pepper and all similar substances from which heat can be evolved.

Science has done much to utilise and conserve the heat derivable from respiration and from the combustion of fuel in our stoves and grates. By means of suitable clothing and muscular exercise, we husband the heat produced within us; and by properly constructed fireplaces and dwelling-houses, we economise the heat of our fires. It is very questionable if science has done as much in utilising and controlling the immense amount of heat continually radiating from the sun. Even in our temperate zone, during our brief summer, the poet makes the sun 'shoot full perfection through the swelling year;' which is

the literal truth. But at what expense and pains do our 'busy housewives' prevent his benign rays from penetrating our dwellings. Window-blinds of every form have become a great article of modern trade. The advantages obtained from cheapened glass in the form of enlarged windows, are in great measure lost. The fear of faded colours in carpets, hangings, and other upholstery, deprives our apartments of a healthy influence from the great source of light and heat. On a smaller scale, might it not be said that the parasol (sun-guard) saves the complexion of our fair kinswomen at the expense of their health and vigour.

There are some indications of a more rational appreciation of the value of sunshine both as a preservative and restorative of health. The late Mr David Urquhart, M.P., and Secretary to the British Embassy at Constantinople, who acquired vast experience in the East, attached great importance to the rays of the sun as a means of cure. He affirmed that he cured even consumption by means of exposure of the body of the patient to sunlight, without any other remedy. In a work on the Turkish Bath, by Sir John Fife, senior surgeon to the Newcastle Infirmary, in which he gives many passages from the writings of Mr Urquhart, this agency of sunshine is introduced. The experience of a New York physician is quoted to the effect, that he had so many facts illustrating the power of the sun's rays in curing certain diseases, that he seriously thought of publishing a work to be entitled the *Sun-cure*. He says: 'I have assisted many dyspeptic, neuralgic, rheumatic, and hypochondriacal people into health by the sun-cure.' He mentions the case of an overwrought lawyer who was suffering from partial paralysis. His right leg and hip were reduced in size, with constant pain in the loins. He was obliged, in coming up-stairs, to raise the left foot first, and drag the right foot after it. He told the doctor he had been failing for several years, closing with: 'My work is done. At sixty, I find myself worn out.' The doctor directed him to lie down under a large window, and allow the sunshine to reach every part of his body. He was to begin with ten minutes a day, gradually increasing it to an hour. His habits were not materially altered in any other respect. The result was that in six months he came running up-stairs like a vigorous man of forty, and declared, with sparkling eyes: 'I have twenty years more of work in me.'

Mr Urquhart mentions the experience of a correspondent of his, who had been recommended by Dr Proel, at the baths of Gastein, to try air-baths in the neighbouring forest. At first, he used to remain for two hours undressed in the shadiest part of the forest. He confidently asserts that his health derived the greatest benefit from this practice. But on another visit to the continent, he determined on the addition of what he terms another element of power—full sunshine. He says: 'I am easily affected by the sun; the consequence being headache and derangement of stomach. I found, however, when the body was entirely exposed to the sunshine, and without even the head being covered, or the pit of the stomach—an equally sensitive part—being sheltered from the rays, that I was not in the slightest degree unpleasantly affected. But on resuming my

clothes, or even a portion of my clothing, I instantly experienced the symptoms I have alluded to, and was obliged quickly to get into the shade. I reversed the experiment, and proved the fact.' He further describes the sensation of sunshine on the body as very agreeable—genial warmth, not heat, being felt. He noticed, on covering any portion of it with a single fold of light clothing or linen, that the heat on that part became intolerable. These sunshine-baths lasted from half an hour to an hour and a half in ordinary summer heat. He also mentions a pricking and itching sensation all over the body, with redness of the skin, which followed these sunshine-baths. These symptoms lasted a couple of days; but he used no remedy, only he did not try any more baths till they had disappeared.

Shortly afterwards, Mr Urquhart met one of the most celebrated physicians in Europe, Dr Scanzoni of Würzburg. He was much interested in the narrative of the sunshine-bath, and anticipated the statement respecting the head remaining unaffected. The doctor explained it by the equal diffusion of the sunshine over the whole body, by which the action of the blood would not be determined merely to the head. The doctor also gave him to understand that the greatest power is practically the most ignored by medical science—that it is unreasonable not to believe that the great centre of action in nature can exert vast influence on the human organism, and develop the energies and resources of life.

The curative properties of heat were observed fifty years ago in the experience of a French physician, who fortunately committed the results to the press. Dr Gosse of Geneva published a book entitled *Des Maladies Rhumatoïdes* (Geneva and Paris, 1826). In this work, the author speaks highly of the remedial value of heat. He says: 'The excitant which plays the most important rôle in the phenomena whether of health or of disease, is caloric—a fluid imponderable and incompressible, which pervades all bodies, and vivifies all organised existences. No other agent can be compared with this one in the treatment of rheumatoid disorders. It is, so to say, the soul of this treatment, and all other means can only be regarded as subordinate. Who can tell if even those substances which we define as excitant are not indebted to its presence for their properties? At least, we find amongst them principles eminently combustible, and which disengage a considerable quantity of light and of caloric.' Dr Gosse regards the restoring the action of the skin as the *modus operandi* of heat as a remedy. He says this explains the immense advantages derived by the Greeks and Romans from the use of the bath. While still employed by the Russians and the nations of the East, he regretted its neglect in the central parts of Europe, where a less equable climate renders rheumatic affections more frequent and inveterate. He says: 'We ought to put up prayers that the European governments may favour the introduction of such public establishments, and so bring within the reach of the citizens unendowed with fortune this real panacea for the larger portion of the evils that assail mankind.'

It may be mentioned that whether the theory of heat current when Dr Gosse wrote, or that now more generally received, be the correct one, the

practical value of heat as a remedial agency is in nowise affected.

It is now about twenty years since the hot-air bath was introduced as a curative agency into the Newcastle Infirmary. Sir John Fife, senior surgeon to the Infirmary, had experienced the benefit of a private bath in Northumberland, in which he was treated as a patient. He brought it under the notice of the Pathological Society of Newcastle, and also the House Committee of the Infirmary. The Duke of Northumberland lent his influence to the movement, having witnessed, during his Eastern travels, the value of the bath. The result was the construction of a hot-air bath in the hospital. The Report of the Infirmary bears ample testimony to the value of the bath in a great variety of cases considered suitable for treatment.

The hot-air bath has also been found suitable for the treatment of mental disease. It has been introduced into several lunatic asylums. The *Lancet*, in noticing the Fifth Annual Report of the Sussex County Lunatic Asylum, mentions that Dr Lockhart Robertson published some important remarks on the Turkish bath as a curative agent. He relates a case in which a patient was admitted with symptoms of mania, complicated with dropsy and albuminuria of the most severe character. The patient was in a desperate state, menaced with madness and paralysis, and apparently dying from the extent of kidney disease. Dr Robertson states that the bath saved the patient's life, and restored him to reason. He believes its medical uses to be very great. Of its curative power in the early stages of consumption, he has had several examples, and is of opinion that if used at a sufficiently high temperature—a hundred and seventy to two hundred degrees—the results will astonish us all.

Mr Urquhart explains that this high temperature is quite endurable when the heat is radiating. Heat which is transmitted through flues is said to be more oppressive at high temperatures than heat which radiates directly from a heated surface such as a stove. He does not profess to explain the reason; but he thinks radiating heat more nearly resembles the rays of the sun, and impresses one with a sort of electrical action. This seems to correspond with a fact quoted, on the authority of Sir David Brewster, in regard to the effect of sunbeams on magnets. Professor Barlocci found that an armed natural lodestone which would carry one and a half Roman pounds, had its power nearly doubled by twenty-four hours' exposure to the strong light of the sun. M. Zantedeschi found that an artificial horse-shoe lodestone which carried thirteen and a half ounces, carried three and a half more by three days' exposure, and at last arrived to thirty-one ounces by continuing in the sun's light. He found that while the strength increased in oxidated magnets, it diminished in those which were not oxidated, the diminution becoming insensible when the lodestone was highly polished. He now concentrated the solar rays upon the lodestone by means of a lens; and he found that both in oxidated and polished magnets, they acquire strength when their north pole is exposed to the sun's rays, and lose strength when the south pole is exposed.

It is well known that the action of the hot-air bath on the human frame operates through the

skin. In many diseases, the skin is under-active, and requires increased circulation of blood. The congestion of internal organs is thus relieved, and digestion, respiration, &c. promoted.

## TOM'S WIFE

### CHAPTER III.

ALTHOUGH I had succeeded in checking the utterance of the vow on Tom's lips, yet he speedily fulfilled it, as if it had been duly recorded against him. He sought out Jessica in her French home. His eager love proved triumphant; and he wrote to me that in a few weeks' time they would be united at the British Consulate. His sanguine temperament made him, notwithstanding several rebuffs, still hopeful of obtaining employment. He had an annual income of about a hundred pounds of his own, which he had inherited from his mother. Beyond that, he was possessed of nothing save his own untried talents.

As far as I could judge, his father still seemed to maintain his feeling of resentment against him, for he refused to allow me ever to mention his name in his presence. Tom's letter to me from Paris with the news of his approaching marriage, first caused the silence to be broken. His last hope was gone, and he would indeed disinherit his disobedient son. The Hall and Park were entailed; but what would they be without money to maintain them? The rest of his extensive property was his own absolutely, and this he determined to leave to Christabel Favre, formerly Christabel Martin. 'And, Woollaston,' he added, as I listened to him in silence, 'let the will state that I have disinherited my son for disobedience and disrespect to his father, so that hereafter the words may rankle within him, and their remembrance be as gall and wormwood.'

Poor miserable old man! And so you would sting from beyond the grave, carrying your vengeance into another world, where, if our past be remembered, how small must seem the good of even the best among us.

We were standing talking not far from the dower-house. 'You do not know her, I think,' said the Squire, as, at the conclusion of his speech, my eyes wandered in the direction of Madame Favre's abode. 'I am going to call on her. Come with me, and I will introduce you to her.' Linking his arm within mine, he led me to the house.

Madame Favre, fortunately, was at home; and the neat little maid—one of our village lasses, for Madame had only brought her own personal attendant with her—opened the door, and at once ushered us into the drawing-room. The furniture was very prim and old-fashioned; but the delicate arrangement of the room, with its pretty pink-lined curtains, and bowls and vases filled with winter flowers, robbed it of its stiffness, and lent it a feminine grace, which must have owed its origin to its mistress's refined and cultured taste. Presently, the door opened, and a tall, elegant woman entered, with a graceful, gliding movement. Her black dress was plain and simple, almost to severity, and fitted closely to the supple outlines of her well-formed figure. I should have estimated her age as about thirty,

although, from her appearance, she might well have passed for a much younger woman. The face was undoubtedly captivating, though it possessed features in some respects too strongly contrasting, and the light of her dark hazel eyes seemed to me slightly furtive and restless. Her soft, golden hair was uncovered by anything to denote widowhood, and the beautifully modelled white hands displayed no ornaments save a wedding-ring and an unpretending keeper. She received us with a sweet graciousness; and soon I found myself rapidly succumbing to her fascinating power, and half regretting the Rosebank Cottage episode, which had deprived Tom of the chance of winning so fair a prize.

'You will not forget me, if you should hear of anything that would be likely to suit me,' she said as we rose to leave, after she had confided to me the requirements of the residence for which she was searching. 'I have no one to advise me now—I am quite alone,' she murmured with a pretty little sigh, as she half-absently bent her gaze on a small ivory miniature that was standing, in a costly frame, on the mantel-piece.

'Not quite alone, Madame Favre,' interposed the Squire gallantly. 'I am always at your service—and so is Mr Woollaston.' There was a humorous twinkle in his shrewd old eyes as he glanced at me; and my foolish, shrivelled, old cheeks actually flushed at the covert railery, as my old-world politeness made me bow my head and murmur: 'I am ever your obedient servant, Madame.'

'John,' cried the Squire, turning so as to face me, as we reached the Park gates, and addressing me by my Christian name, as in the days when we were lads together, 'are you going to take unto yourself a wife in your old age?'

'Why not?' I returned jokingly.

'Your years are threescore and ten, John.'

'Ay, what then?' I retorted. 'Why should not the heart be as green at seventy as at twenty?'

Time passed on, and I delayed as long as I could the preparation of the unnatural and vindictive deed by which the old man proposed to disinherit his son. Meanwhile, I had again heard from Tom, this time telling me that he was actually married, and that he intended, after some weeks' stay in France, to proceed to London, in the hope of obtaining employment. I was half afraid to mention the fact to the Squire, as I judged it would at once bring matters to an issue, and that he would order the will to be immediately completed and signed. Still a few weeks more were allowed to elapse, during which time I, as much as possible, avoided meeting the Squire. But one day he called upon me, and asked if I had had any further letters from his son. I told him that I had, and that Tom was married. He was in a state of great excitement and wrath; and it was with some difficulty that I could subdue his rage enough to enable us to converse in ordinary business terms of the will, which he now told me to prepare without another day's delay. I made more than one attempt to intercede for the young man thus to be disinherited; but this only served to exasperate him still more; and he intimated that if I was not prepared to carry out his wishes, he would be necessitated to place his affairs in the hands of another agent.

Merely as a matter of business, my connection with the Squire was of small moment to me; but we had been old friends, and I had long managed all the affairs of the Athelings of Atheling, and did not relish any suggestion of another taking my place. Besides, I considered that my refusal to draw up the will would not in any way prevent the Squire from carrying out his design; while, if the matter were placed in other hands, I should lose the opportunity of still doing something, as I hoped, for the advantage of his banished and disinherited son. The obnoxious document, therefore, was prepared, the Squire himself writing the draft of the fatal clause that disinherited his son, and a day was fixed for me to call at the Hall to have it signed.

On the day named I found my client waiting for me in the library. Everything was in readiness; and the will, which was very short, was quickly read through. The pen was in his hand, and I was about to summon two of the servants as witnesses, when he stopped me. 'Does not marriage invalidate a will?' he asked as he turned to me inquiringly.

'It does,' I replied, 'if signed before the ceremony.'

'Humph!' he muttered, as if considering some point. He paused for a moment, and then added, as if he had found a solution of his difficulty: 'Procrastination is always dangerous. I will sign this now; and if another should be required, why, you won't object. It will be so much more gait to your mill.'

'Certainly,' I replied, taking his joke in good-humour; 'and I am glad to hear you talk of making another will, for this is a most unjust one.'

'You are purposely and unnecessarily wandering from the question,' he said with icy sarcasm. 'I have no intention of making any alteration in my will. I was alluding to the probability of my marriage with Madame Favre.'

'Indeed!' I exclaimed, at a loss for words with which to express my surprise.

'Yes,' he continued; 'I have written to her on the subject, and am now awaiting her answer. No reason, you know, Woollaston,' he added with sly humour, repeating my own words, 'that the heart should not be as green at seventy as at twenty.'

I could only laugh. A great disparity in age between husband and wife, on whichever side it may be, is generally objectionable; but beyond this, I could see no valid reason against the marriage. The lady's ample fortune would obviate the necessity of a large jointure to cumber the estate. Again, I was in hopes that if the Squire once saw the golden bait that had tempted him, within his grasp, his resentment against Tom might become softened, and eventually, under his wife's undoubtedly amiable influence, be entirely removed.

I could not, however, find words in which to offer the money-loving old suitor any congratulations upon the step which he proposed to take, and somehow I could not help wishing that the lady would have the good sense to refuse the offered marriage. As it was, I was fain to hide my confusion and dislike of the proceeding, by ringing the bell, and calling in a couple of servants to witness the signing of the deed. A few minutes

served to complete the work; and I took an early opportunity of bidding good-bye to the Squire, making a pretence of urgent business elsewhere the excuse for not staying to dine with him, as he seemed more than usually anxious I should do.

As I returned to my office, I could not help reflecting upon the sudden and unexpected determination of the Squire to marry this lady, so much his junior in years, and so unlike him in other respects; and in truth I scarcely knew whether to attribute his resolve more to a feeling of revenge against his son, or simply to a desire to possess the lady's large and unencumbered fortune. I felt inclined to write to Tom at once, and tell him of what was taking place; but on second thoughts I decided that it would be better to delay doing so till I knew the issue of the Squire's proposal to the beautiful widow.

I was not allowed to remain long in suspense. Next afternoon, the Atheling carriage arrived at my door, and the Squire walked into my room.

'Congratulate me, John!' he cried, with something like juvenile merriment, which sat ill upon a countenance where age had already left its indelible imprint. 'Congratulate me! The lady has accepted my offer; and in one month from to-day, Madame Favre is to become the Lady of Atheling Manor.'

'Well, well,' I said, with a faint attempt to appear hearty, 'you are doing twice what I have not yet had the courage to do once.'

'But, then, there is no reason why the heart should not be as green at seventy as at twenty!' he replied, slapping me on the shoulder.

I felt that I could not reciprocate his jocularly, and so was glad when he proceeded to some other matters of business between us than this of his marriage. After his departure, I sat down and wrote to Tom a brief account of what had taken place, hiding my own concern as to the issue of this strange turn of events under expressions of hope that things might somehow be brought about by the lady's influence to remove the Squire's feelings of antipathy towards his son. But this was more with a view to Tom's peace of mind than my own; for I could not divest myself of the fear that the consequences of this marriage might be more inimical to Tom's chances of succession than at first sight it had seemed to me.

For a week I saw nothing more of the Squire; but at the end of that time he called, and stated that it would be necessary for me to prepare a contract of marriage, and that without delay, as Madame Favre found it necessary to go to France on some business which her agent in Paris could not complete in her absence; and for this reason, it was decided that the marriage should take place in the following week, after which the Squire would accompany her to the continent. The terms of the contract were therefore agreed upon; and they were somewhat peculiar. Under this agreement, he was to receive from Madame Favre the absolute possession of all her property, both heritable and movable; she, on her part, to receive a large annual sum in name of pin-money out of the Atheling estate, with a handsome jointure in the event of her surviving him. It is unnecessary to enter into details regarding the other provisions of the contract, except to say that the Squire's son was by name excluded from

the succession, in accordance with the terms of the will already executed by his father.

However unpleasant might be my feelings on the subject, I had no alternative but to comply with the Squire's wishes, or rather commands. This was on Wednesday; and it was arranged that on Friday I should go to Atheling with the completed contract, in order that it might be signed by the principals, and the matter concluded. The marriage was to take place on the Monday following. My heart bled for Tom; but as I had already written him as to his father's engagement with Madame Favre, and as no further letter could now reach him in time to admit of any interference on his part, even if that were of any use, I contented myself with allowing things to take their course.

### C I D E R.

IN England, the cider-apple is principally grown in Herefordshire and Devonshire, and in portions of Gloucestershire, Monmouthshire, Worcestershire, Dorsetshire, Somersetshire, and Cornwall; and, on the other side of the British Channel, must be mentioned Jersey, Normandy, and Brittany. Many a farmer counts, in a good year, upon paying his rent by his cider-harvest. Although its value in relation to other beverages is not great, it is astonishing how important a factor it is in successful farming in those districts, and what a respectable *pièce de résistance* is a good cellarful of this drink. Throughout the summer, but especially in hay and harvest time, the quantity consumed by the farm-labourer would astonish the North-countryman or town operative, it being considered nothing unusual for him to dispose of his two to three gallons in a day; and the farmer, his sons and his servants, and in many cases his whole household, make use of hardly any other drink throughout the year. If the farmer's stock runs dry in consequence of a meagre harvest, he is obliged to procure the cider at any price, for the labourers will insist upon a regular allowance of their favourite refreshment. In some districts the use of beer is gradually being substituted in certain establishments for that of cider; but this is not so much to be regretted as the more baneful consumption of cheap spirituous liquors. Notwithstanding so great a consumption of what is sometimes not much better than vinegar, cider-drinking does not appear to be fraught with any very serious results.

At most of the *tables-d'hôte* in Normandy and Brittany, decanters of cider are supplied gratis; and the thirsty wayfarer need only visit a *restaurateur*, to procure a quart of that liquor for about three-halfpence. He may sometimes chance to have the produce of the first pressure applied to the apples, and which the grower calls *gros cidre*; but he is more likely to have to content himself with the second extract, or *petit cidre*, a watery though still not quite innocuous liquid.

The climate and ground of Jersey are particularly adapted for this branch of husbandry, and, in proportion to its size, it produces large quantities. Its manufacture has often been the subject of enactments by the local legislature; and among musty records may be found a claim for expenses incurred in besieging Mount Orgueil Castle in 1487, in which there is an item for

twelve pipes of cider. It is also to be remarked that among the Acts passed in the first year of Queen Mary's reign, 1553, was one forbidding the sale of cider in the island unless the mayor, with two parishioners, had previously tested it and fixed the price. In the same reign, the inhabitants were obliged to petition Her Catholic Majesty for license to import from England, duty free, six hundred and fifty tuns of beer, in consequence of the almost total failure of their apple-harvest. The export trade from that island, which, especially to Bristol and the west and north of England, was, during a long period, of considerable dimensions, has of late years received a gradual but important check, in consequence of the unprincipled practices of some exporters, who, aware that acetate of lead, commonly known as sugar of lead, possessed the property of speedily 'fining' new cider, did not scruple to make use of it, in order to give to their produce the semblance of superior liquor.

Orchard-culture does not present many important differences. Some cultivators adopt the system of high grafting, say at a height of five to seven feet; and others are satisfied with stocks of half the height. According to the nature or state of the soil, the aspect, prevalent wind, &c., the orchard-planter decides upon the system he must adopt in planting; but no estimate of the productive value of an orchard can be formed from its extent, as, whether through exposure, pooriness of soil, decaying stocks, want of manure, or other causes, a five-acre plantation will sometimes yield less and inferior fruit than another of one-fifth its size. As a rule, when once the trees are planted, the farmer devotes very little time to them, save when the gathering season comes round. Sometimes he opens the ground near his young trees; but that attention ceases after the third or fourth year, and then he may apply a winter deposit of decaying weeds or other cheap organic manures; but the general inattention to this matter, and generally unskilful pruning, cannot but too frequently make a serious difference in his financial returns.

To enumerate the different varieties of apples used in the manufacture of cider, would be somewhat difficult, and would only interest a pomologist. Next in importance to that variety, which is immense, is the different seasons at which the fruit ripens. Some, as the codlings, begin to fall from the middle to the end of September; while others only attain maturity in the end of November; and here the manufacturer on a small scale meets with a drawback. The inferiority of cider may in many cases be attributed to the improper assortment of apples; and it is well known that to make good liquor there are combinations of certain kinds of fruit which admit of being ground together, so that the disadvantage of the small grower is apparent, when it is borne in mind that his 'mashes' must of necessity be few in number, and his different sorts of fruit cannot be equally fit for use. Even among those who have better opportunities, the practice of indiscriminately mingling sweet and sour, ripe and green, is too frequently followed.

When the autumn breezes cause the earlier apples to fall, the husbandman carefully gathers them, and collects them into heaps under the shade of his larger trees, where they remain for

some weeks, until they have acquired the proper degree of mellowness; and the judgment required to decide the latter point would put a novice completely 'at sea.' The remaining fruit is sometimes picked by children, but more generally shaken down; and a valuable tree is frequently injured by the incautious use of poles.

The different heaps having been pronounced in a satisfactory condition, the most arduous phase of the manufacture commences. The apples are taken to the mill or press-house, and thrown into the 'chase'—a circular trough of hewn stone. For crushing them, a heavy millstone or 'runner' is used, driven by one or two horses, blindfolded as they tramp their wearisome circles, which have to be continued until the fruit is so thoroughly 'mashed' that the pulp or 'must' may be squeezed between the fingers without the detection of any lumps, and has acquired a deep colour. The pulp is then placed upon 'hairs'—square horse-hair cloths, which are spread under a powerful press, fitted with a wooden or iron screw. The latter is applied when eight or ten 'hairs' have been filled, the edges well folded, and the whole surmounted with a solid wooden frame. In some districts, the layers are made with unbroken straw or reed. The expressed juice flows thickly into flat tubs, or is poured into open casks, at the rate of four to six hogsheds for each 'mash.' The dry residue is usually given to the pigs, or thrown on the manure-heap; but sometimes in England, and generally in France, it is watered and pressed a second time, producing an inferior beverage appropriately called *petit cidre*.

The casks are now either exposed to the open air or placed in draughty buildings; and in a few days, according to the weather, the liquor will ferment and become clear, when it is 'racked,' or drawn off into other casks. It is during the process of fermentation that the manufacturer has to exercise the most delicate skill; for if the fermentation be insufficient, the cider will not attain the requisite brightness and flavour. If it be excessive, the result will be poorness and acidity; and a rapidly fermented liquor does not keep well. By the addition of yeast or isinglass, the fermentation and condition may be assisted; but successful results are in the greatest measure dependent upon the skilled watchfulness of the maker. Doctorings, by the addition of treacle or other sweetening and colouring materials, are frequently had recourse to by cider-merchants and taverners, but in rare cases by manufacturers. On many farms, it is usual to burn a small quantity of sulphur in the casks intended for the reception of the cider, the effect being generally the prevention of further perceptible fermentation; but it occasionally happens that the cider has more than once to be racked from one set of casks to another until it is considered safe. The discovery was made by Mr Leuchars, a German chemist, that newly burned charcoal possessed the property of checking the fermentation of new wines; and the principle was applied in the manufacture of cider by Mr Knight, a former President of the Horticultural Society of London, with successful results. He found that the fermentation was completely arrested, and the harshness rendered *nil*, the only drawback, if any, being that some of the colouring matter became absorbed.

In the first weeks of the year, the casks are

stored in large cellars or cool sheds; and the 'bunging-down' takes place two months later, when the cider is ready for delivery to the consumer.

## THE WEDDING MARCH

### AN ARTIST'S STORY.

'No. 329—A Wedding March.' Such was the number and name of a picture in the 'Academy' of a certain year which shall, for politic and personal reasons, be left undesignated. The picture was one of my painting; and I, Reginald Tracey, had been fortunate enough to attain three very important ends by its production. Firstly, it was deemed excellent enough by the Hanging Committee to be placed on the line, and it faced you in a very prominent manner as you entered Room No. V. Secondly, this prominent position secured for my picture a large share of attention, which resulted in its finding a purchaser almost as soon as the Exhibition doors opened. But thirdly, it served the actual purpose for which I painted it, and which led me to choose my subject. That purpose involved just the least bit of romance; and although the clever critics praised the picture, and even hinted that 'Mr Tracey had been singularly fortunate in his treatment of a somewhat unusual and difficult theme,' &c., not one of them so much as guessed that it was a picture with a purpose. As the sequel may serve to show, that purpose sprang from and ended in what I am pleased to call my little romance.

It was a charming day that on which I went to Rockhampton to sketch the water-meadows, and to see my old friend Dr James Brooke—Jim, I generally called him—who had settled as a practitioner in that town. The whole place was steeped in sunlight; and the deep shadows cast by the old houses in the narrow streets by the waterside, reminded one of nothing so much as the blackness of the shades in some old Dutch town; where Rembrandt must have learned the special art that bears the impress of his genius to-day. The old church of Rockhampton is a fine bit of Norman architecture. Rising architects declare that there are no purer pillars of that style, or better preserved arches, with their queer faces squeezed into the corners thereof, and which seem to impress the Rockhampton juveniles on Sundays quite as much as the service. Passing through the churchyard, I found myself at last at the church. With little hope of finding the door open, I lifted the latch, when at once it yielded to my touch. As I passed within the green baize doors within the porch, I heard the sound of the organ; so stealing quietly into the grateful shade and coolness of the church, I ensconced myself in the biggest pew I could find, and listened. How soothing was the effect of the music and surroundings on that glorious day. I could not see the player, who was concealed by the curtains in front of the organ-loft, but intuitively I guessed it was a lady who played. I imagined that only a woman's delicate touch could have made that *Kyrie* speak in these tones; and there was more gentleness than power in the *Stabat Mater* into which the player glided. Then

I remember the *Wedding March* succeeded; and after half an hour's private hearing of the masters, I quietly slipped out of church, once again into the glad sunlight that played around the grave-stones, and made the world so fair to see.

After lunching at my hotel, the *Red Lion*, I went to see Dr Jim. It appeared that the fair player of the church was a Miss Spalding, and the only daughter of a well-to-do and retired merchant who had settled at Rockhampton some eighteen months before; and Jim, I found, had been paying his addresses to the young lady. Her father had married for the second time, and had thus given Miss Spalding a step-mother. The old gentleman, as Jim called him, was an easy-going man, kind-hearted in every way, generous to a fault, and looked kindly enough on Dr Jim's suit. But as to Mrs Spalding, Jim pronounced a decidedly unfavourable opinion. She was an ambitious and, as he expressed it, scheming woman, who thought that Nelly should look somewhat higher than Dr Brooke of Rockhampton—and that she should at least marry money—with which latter commodity, Jim was, as a young doctor of course, by no means overburdened. Without actually discouraging Jim's attentions, Mrs Spalding made things decidedly unpleasant for the lovers. Mr Spalding, good easy man, was completely under the dominion of his wife. Hence, Jim confessed, he was in a somewhat unsettled state of mind.

'You see, Regy,' said Jim, 'Nelly will not disobey her parents in any way. That she cares for me, she has confessed to me more than once. But when I press her to consent to be married at once, and to make me happy, she won't hear of it.'

'My dear Jim,' I responded, in my new-found capacity of guide, counsellor, and friend, 'she is not the first girl who has had to struggle between love and duty; or at least what she conceives to be her duty.'

'She is so thoroughly conscientious,' replied Jim, 'that I feel even to press her to take the step which would make me a happy man for life. When I ask her, in my despair, whether she will ever choose between her step-mother's wishes and my love, she implores me not to tempt her; and so,' added Jim, 'here I am; miserable as need be.'

All this interested me exceedingly. She was evidently a girl of sterling worth, and with a high sense of the duty she believed she owed to her parents' wishes. I thought over Master Jim's love affair as I lay in bed that night, and came to the conclusion that the case was a difficult one. You cannot always mould human minds to your own bent and purpose by simply speaking. Hence I came to the conclusion that Miss Spalding's love for my old friend ought to be tested and tried in some other way. As my experience of human nature goes, there seems nothing like putting love, of all human emotions, to some rigid test. But how the test could be applied to the case in which I had thus been led to feel a special interest, I knew not.

I confessed, as I rolled over to sleep, that I did not see my way clear to help them. Little did I think that the morrow was to bring the means and the man. The man was Josiah Blagden, Esquire, iron-founder, of the firm of Blagden,

Bilge, & Co., of Birmingham and elsewhere; the means was—my humble self.

The day after my arrival at Rockhampton, Jim proposed that I should drive with him on his morning round, and added he: 'We'll call at Mount Grove on our way home.' Mount Grove was the residence of Mr Spalding; and two o'clock found us at the gate of a very nice villa residence, overlooking the river, and standing within its own nicely kept grounds.

We were ushered into the drawing-room, where we found assembled certain persons whom Jim had not expected to see. Mr Spalding received me courteously, as also did Mrs Spalding. Miss Nelly greeted me most cordially, adding that she was much pleased to make the acquaintance of Dr Brooke's old friend of whom he so often spoke. In addition to the family-circle of three, it was clear there were strangers present. These latter were Mr Josiah Blagden and his sister. Mr Blagden did not impress me favourably. He was a stout, florid-complexioned man, remarkable for the extreme breadth of his white waistcoat and for the profusion of jewellery displayed thereon.

'A safe man, my dear sir; a very safe man,' said Mr Spalding to me at lunch. 'Why I suppose his turn-over is about half a million a year—the iron trade, you know,' added the old gentleman by way of explaining that Mr Blagden was one of the metal-kings of England.

'Self-made man too,' said Mr Spalding; 'began life as a foundry-boy.'

From what I saw of Mr Blagden within the next few weeks, his origin could have been pretty accurately guessed from the manner in which he imparted the 'foundry-boy's' manners into the sphere in which his industry and success had led him. He was essentially a vulgar man, who bullied his sister, a meek, silent little woman, with a good heart and a kindly nature, as I discovered later on.

As we drove home from lunch that day, Jim was strangely depressed. I guessed his thoughts pretty accurately, for he burst out into a tirade against Mrs Spalding on our arrival at home.

'I shouldn't wonder, Regy,' said he, 'if that fellow Blagden has been invited down here as a suitor for Nelly. He's a friend of Mrs Spalding's, I know, because she herself comes from the "Black Country."'

Jim's state of mind, from the moment he broached this theory, may be better imagined than described. For the next three weeks I am bound to say that his temper was well-nigh unendurable. One evening at dinner at Mount Grove, I felt half afraid he was going to inflict personal chastisement upon Mr Blagden; a feat I should have much rejoiced to have seen skilfully performed, after the iron-master's coarse invectives against the medical profession, which had been called forth during some argument concerning doctors' fees. Nelly's attitude towards Jim appeared to have undergone no perceptible change. She was loving and gentle as before; but I fancied that Mrs Spalding contrived dexterously to keep Miss Blagden and Nelly as frequently together as possible; and thus Jim's *lâche-tâtes* were reduced to a miserable minimum. Worst of all, as Jim remarked to me one day, Nelly had confessed that her step-mother had on more

than one occasion hinted that Mr Blagden's visit and stay were not solely prompted by friendship to her parents. Mrs Spalding was, in other words, a clever woman, playing a nice little game of diplomacy, and whilst keeping on the most friendly terms with Jim, was to my mind, furthering her own aims and ideas of a matrimonial alliance for Nelly with the elderly iron-founder. I know that most of my readers will say that Miss Spalding should have settled the matter for herself, and have given Mr Blagden to understand that his attentions were unwelcome and hopeless. But as I remarked before, we are not all cast in one mould; and the most loving natures may sometimes be coerced by what seems to be their duty, into self-sacrifice of the most unreasonable kind, and which can only entail misery in the end.

So things went on at Rockhampton, with diplomacy at Mount Grove, and despair at No. 14 High Street, where Dr James Brooke announced his willingness to relieve the afflicted daily from ten to eleven A.M. and from six to eight P.M. I had been sitting cogitating over matters one evening at the *Red Lion*—Jim having been called to a distant part of his parish—when an idea, founded, I believe, on a quotation from an old French author, occurred to me. The quotation was to the effect, that 'when moral suasion fails from any cause to change an opinion, it is lawful to appeal to the most trivial of our emotions.' Happy idea! thought I. I shall see whether or not I can work it out to the advantage of Dr James Brooke and—shall I add it?—to the confusion of Josiah Blagden, Esquire.

My plans were then rapidly matured. Morning, noon, and night find me busy in the old church. I am hard at work on a canvas in which the interior of the edifice grows under my brush day by day. There are no sounds of the *Kurik* now; nor are the jubilant strains of Mendelssohn heard, as on a bright sunny day not so far gone by. Nelly does not come to practise her old favourites as of yore. Blagden, I know, hates music; and painters, as he once expressed it—in shocking bad taste—are usually 'a seedy lot.' I remember Mr Josiah's white vest and the cable chain, with enough appendages attached thereto to have set up a small jeweller in a thriving way of business. The aisle and gallery of the church are now complete in my picture. I paint it as I sit in the aisle; in the distance you can see the altar and chancel: and the vicar who looks in upon me occasionally, says it is as like as can be. He is curious, however, to know the nature of the figures I have sketched roughly in. There is a group passing down the aisle from the altar-rails where the vicar can still be seen at his post; and there is a figure standing alone and solitary in a pew, as if facing the advancing party. The vicar cannot quite fathom the design. The church he can understand; but the *meaning* of the picture puzzles him. I bid him wait patiently for the solution of the mystery.

When my study of the church was completed, I went home to the *Red Lion*, and there I painted in my figures. There was little need for models, for my sketch-book was full of studies. Turning to my picture, now progressing rapidly, I find that there are heads of two elderly men, and there is a careful sketch of a young man's face likewise.

There is a fair girl's face, and a matronly countenance, and another face which seems not unlike that of Miss Blagden. At last, my task is completed. The picture is a mere 'study,' but it is a careful study withal. The old church you recognise at a glance; the figures— Well, we shall see.

The vicar has been busily spreading a report that I have been painting pictures of the church, and there is curiosity to see them. I now propose that one fine day a very few of my Rockhampton friends shall come to see my work. The circle is very select. I have invited only Mr and Mrs Spalding, the great Josiah, Miss Blagden, and Jim. I contrive, with a diplomatic cunning for which I have not before given myself credit, that Nelly Spalding shall be admitted to a private view. She herself has been all anxiety to see the picture, and I pretend that by great favour she shall see it before any one else. Mine host of the *Red Lion* has prepared a nice little luncheon, even to some dry Pommery, which 'the great Josiah'—as I have been accustomed to call him, possibly from the magnitude of his waistcoats—says he dotes upon. I make a malicious and unkind but perfectly just mental suggestion that in early life, 'the great Josiah' was 'better acquainted with the merit of "half-and-half" than dry champagne. Mine host has done his best; and now I wait my guests. I feel nervous and excited; why, I can hardly tell; but I confess to myself, that I shall be glad when my little symposium is over.

Here at last. They troop up-stairs into the large room where my luncheon is spread. Mr Josiah is looking very large to-day. There is an air of jubilant triumph about him as he bustles about Nelly, assisting her in taking off her wraps, and saying 'nothings' which are anything but 'soft,' as the great man expresses them. To me, his air is simply patronising. Mrs Spalding is gracious as usual; and Mr Spalding seems to regard the near prospect of lunch with more evident satisfaction than he does the prospect of an artistic treat. Mr Blagden suggests we had better step in to see the picture—lunch has evidently its attractions for 'the great Josiah.' But I tell him I wait Dr Brooke, at which announcement, he subsides. Then I suggest to Miss Nelly, that with her mother's permission, she may now have the picture all to herself for a momentary peep. Mrs Spalding, who is deep with Miss Blagden in the mysteries of the manufacture of rhubarb-jam, readily consents.

Nelly follows me into the room, where my picture stands, covered with a crimson cloth, on my easel. I close the door, and unveil it. Nelly glances at it for a moment; then growing deadly pale, sinks half-fainting—not into my arms, but into those of Dr James Brooke, who has most opportunely come upon the scene. In speechless astonishment he gazes at me, but he too seems as if he were going to repeat Nelly's procedure, as he glances at the picture. 'For heaven's sake, Regy,' says Jim in a hoarse voice, 'cover that picture up!'

Nelly opened her eyes in a moment or two, which seemed to me like an age. Jim had employed the interval in a fashion not unfamiliar to lovers, I believe. And when she did open her eyes, it was to clasp Jim round the neck, and her

words were few but decided: 'Jim, dear! I can never, never marry that man! I will do whatever you wish me to. But oh! they have tried me so!'

What is it in my picture that has so perturbed the lovers, and brought Nelly Spalding to her senses? Simply the interior of the old church once again. A ray of sunlight streaming through a chink in the stained window falls on the sad, pale, tearful face of a newly-made bride. The bride's face is Nelly's own; and the pompous bridegroom is Josiah Blagden, the artistic treatment of whose white waistcoat and chain has cost me no end of pains. Behind bride and bridegroom come the figures of Mr and Mrs Spalding; and in the dim distance the vicar is seen still standing within the altar rails. But the central figure after the bride herself, is the young man, pale, motionless as a statue, who stands in a pew, and whose ashy gaze is fixed on the bride. The face of the man in the pew is that of James Brooke. The picture tells its own story to Nelly Spalding. It places the possibility of the future before her eyes, as she has never dared to picture it to herself. It reflects in all its naked truth, the fate to which through her indecision she may commit herself and Jim. And it tells its story so well, that art conquers diplomacy in decision, and aids love in its triumph over the great Josiah himself.

Footsteps on the stairs. I cover the picture again. Nelly stands beside Dr Brooke; her cheek is pale, and there are tears like dewdrops glistening in her eyes. The iron-master looms in the doorway. He takes in the matter at a glance, and frowns darkly at Jim and me.

As soon as Mr and Mrs Spalding, who closely follow Josiah, have entered the room, Nelly, to my surprise, walks quickly up to her father and takes his hand. 'Father,' said she, with a tremulous yet decisive tone, 'you know the message you brought me from Mr Blagden this morning? Give him my answer now. Tell him that I am going to marry Dr Brooke.'

Now, it is my opinion that, had the discarded Josiah at this moment held his tongue, he might have got both Mr and Mrs Spalding to speak a word for him with Nelly. But, as it was, he destroyed his own case at a blow.

'Message from me?—and this is my answer!' he said in an angry voice. 'Why, I care nowt—nowt,' he repeated bitterly, 'about the matter. I guess it was the lass's father and mother that wanted to marry Josiah Blagden's money—perhaps they wanted some of it for themselves.'

The rudeness and vulgarity which marked the man came out unmistakably as he said these words; and taking his sister's arm in his, and casting a look of vindictive scorn at the doctor and myself, he walked out at the door with an ungainly strut which was meant for dignity; and we saw the great Josiah no more.

Mrs Spalding was especially cut up by the parting fling of Josiah, as it was she who had manoeuvred the matter thus far. Mr Spalding, on the other hand, burst into a jovial laugh, and taking his daughter's hand, placed it in that of the doctor.

After all had left the studio but Mr Spalding, the latter asked me to tell him in plain terms how I had brought this about—for he had no doubt I

was at the bottom of it. I uncovered the picture, which Mr Spalding—simple, easy-minded gentleman that he was—scrutinised with his double eye-glass, remarking to me that he didn't quite understand it at all, but that it was wonderfully clever, and that Josiah's 'weskit was as like as life.'

In six weeks thereafter I officiated as 'best-man' at Jim's marriage. As the organist pealed forth the jubilant strains of Mendelssohn, after the vicar's benediction had been given, and Nelly, radiant and beautiful, passed down the aisle on her husband's arm, I could not help rejoicing in the success of what is now 'No. 329—A Wedding March,' though the faces in the picture as exhibited are slightly disguised, and Mr Josiah's vest has been shorn of certain of its distinctive peculiarities.

That is the romance which, as I told you at the outset, hangs round the picture which in the Academy catalogue was numbered '329—A Wedding March.'

#### FAMILIAR QUOTATIONS.

'APOPTHEGMS,' says Sir Francis Bacon, 'are certainly of excellent use. They are *enunciones carborum*, pointed speeches. Cicero prettily calls them *salinas*, salt-pits; that you may extract salt out of, and sprinkle it where you will. They serve to be interlaced in continued speech. They serve to be recited upon occasion of themselves.'

In our own days, no less than in 'the spacious times of great Elizabeth,' the excellent use of apophthegms is known and turned duly to account. Our daily talk is full of these 'pointed speeches,' derived from a hundred different sources, and very often used without any knowledge of their context, or any thought as to their authors. Who ever thinks, for example, when he cheerily reminds a friend that 'Christmas comes but once a year, and when it comes it brings good cheer,' that he is quoting a modification of the words of old Tusser? the homely philosopher who bids you 'Look ere you leap,' who warns us that 'A stone that is rolling can gather no moss,' and to whom we owe whatever comfort is to be had from the reflection that 'It is an ill wind turns none to good.' The hackneyed phrase, 'Neither fish nor flesh nor good red-herring,' savours little of the style of the 'majestic' Dryden; it is taken, nevertheless, from his epilogue to the *Duke of Guise*. It is probable, however, that many of these sayings were simply adaptations by the authors from popular existing proverbs. It is Dryden also who tells us that 'None but the brave deserve the fair,' that 'Sweet is pleasure after pain,' that it is well to 'Take the good the gods provide,' and who reminds us, in his prologue to *Love for Love*, that 'Men are but children of a larger growth.'

'When Greeks joined Greeks, then was the tug of war'—a line, by the way, which is generally misquoted—is from *Alexander the Great*, written by the mad dramatist Nat Lee. 'Plato, thou reasonest well,' is in the *Cato* of Addison; and from him also come the well-worn phrases, 'Rides

in the whirlwind and directs the storm,' and 'Still I seem to tread on classic ground.' It is in Pope's *Odyssey* that the line occurs, 'Welcome the coming, speed the parting guest,' varied in his translations from Horace by a change of 'parting' into 'going.' As a fruitful source of popular quotations, Pope probably ranks next after Shakspeare, and like him, is often credited with the authorship of lines which he never wrote. To Pope, for example, has often been attributed the famous couplet—

'True patriots we; for, be it understood,  
We left our country for our country's good;

yet this was really composed by the notorious Barrington, as part of the prologue of a play performed by his fellow-convicts at Botany Bay.

The smooth and sonorous line, 'Music hath charms to soothe a savage breast,' which has so often been ascribed to Shakspeare, forms the opening of Congreve's *Mourning Bride*, the play in which occurs that famous description of a temple which Dr Johnson once declared to be the finest poetical passage he had ever read—that he recollected none equal to it in Shakspeare. It is from Congreve, too, that we have borrowed the somewhat terrifying couplet—

Heaven has no rage like love to hatred turned,  
Nor hell a fury like a woman scorned.

Upon the poet Young, many a loan has been levied, without much if any acknowledgment. From his *Night Thoughts* we get, 'Procrastination is the thief of time;' 'Man wants but little, nor that little long;' 'All men think all men mortal but themselves;' 'We take no note of time, but from its loss;' and many another familiar saying.

Grave judges, and others learned in the law, have contributed their quota, as in duty bound, to the common stock of popular sayings. It is Francis Bacon who speaks of matters that 'Come home to men's business and bosom,' who lays down the axiom that 'Knowledge is power,' and who utters that solemn warning to enamoured Benedicks, 'He that hath a wife and children hath given hostages to fortune.' We have the high authority of the renowned Sir Edward Coke for declaring that 'Corporations have no souls,' and that 'A man's house is his castle.' The expression, 'An accident of an accident,' is borrowed from Lord Thurlow. 'The greatest happiness of the greatest number,' occurs in Bentham, but as an acknowledged translation from the learned jurist Beccaria. To *Leviathan* Hobbes we owe the sage maxim, 'Words are wise men's counters, but the money of fools.' It is John Schden who suggests that by throwing a straw into the air you may see the way of the wind; and to his contemporary Oxenstiern is due the discovery, 'With how little wisdom the world is governed.' Mackintosh first used the phrase, 'A wise and masterly inactivity.' 'The schoolmaster is abroad,' is from a speech by Lord Brougham. It does not mean that the teacher is 'abroad,' in the sense of being *absent*,

as many seem to interpret the phrase, but that he is 'abroad,' in the sense of being everywhere *at work*. In the familiar phrase, 'A delusion, a mockery, and a snare,' there is a certain Biblical ring, which has sometimes led to its being quoted as from one or other of the Hebrew prophets; the words are, in fact, an extract from the judgment of Lord Denman at the trial of O'Connell.

Long before Mr Matthew Arnold lived and wrote, Dean Swift had sung the praises of the 'Two noblest things, sweetness and light.' It is Swift also who wrote that 'Censure is the tax a man pays to the public for being eminent;' and who tells us, in his *Tale of a Tub*, that 'Bread is the staff of life.' 'Out of mind as soon as out of sight,' comes from the sonnets of Lord Brooke; and it was his friend and contemporary, Sir Philip Sidney, who coined the phrase, 'My dear, my better-half.' Humphry Gifford, a writer of the sixteenth century, has the following:

I cannot say the crow is white,  
But needs must call a spade a spade.

Bickerstaff, a playwright as seldom read as he is often quoted, is author of the prudent admonition that 'Enough is as good as a feast,' and of the indisputable assertion that 'One cannot have one's cake and eat it too.' From Home's *Douglas* comes the famous speech, 'My name is Norval,' familiar to the readers of Enfield's once celebrated but now forgotten *Speaker*; and in the same play is found the consolatory assurance that 'Virtue is its own reward.' 'The almighty dollar' came to us across the Atlantic from Washington Irving; and it was Beaumont and Fletcher who first taught us to speak of 'money' as 'the sinews of war.' 'How goes the enemy?' is a question often asked in the *Dramatist* of Reynolds; and 'Pray, sir, what is your opinion of things in general?' is one of the 'catchwords' of that impecunious sponger Jeremy Diddler.

From old Chaucer we learn that 'Mordre wol out,' and that it is wise to 'Maken virtue of necessity.' It is he, too, who wrote, 'Yet in our ashen cold is fire yreken,' a passage which the poet Gray must, consciously or unconsciously, have had in memory when he penned the celebrated line, 'Even in our ashes live their wonted fires.' It is Gray also who speaks of 'Youth on the prow, and Pleasure at the helm;' of 'Thoughts that breathe, and words that burn;' who warns us that 'Favourites have no friends,' and that 'Where ignorance is bliss, 'tis folly to be wise.' It is the shy recluse Cowper who expresses his opinion that 'God made the country, and man made the town,' and who sings the praise of 'cups that cheer but not inebriate.' The light-hearted Gay instructs us that 'Life is a jest, and all things show it;' and it is part of his cheerful philosophy that 'While there's life there's hope.'

Foreign writers, moreover, have been made to contribute to our stock of familiar quotations. 'To encourage the others,' was said by Voltaire, apropos to the capital sentence passed upon Admiral Byng. 'To gild the pill,' is probably borrowed from the

line in Molière's *Amphitryon*—'Le seigneur Jupiter suit dorer la pilule.' We learn from the witty Rabelais that 'Appetite comes with eating,' and that men sometimes 'Pay Paul by robbing Peter;' and the old French farce of *Maître Pierre Patelin* supplies us with the humorous expression, 'Let us return to our muttons.' And taking this as a gentle reminder not to stray beyond our proper limits, we may fitly let it serve to close our list of 'familiar quotations.'

#### STATE AID TO TECHNICAL EDUCATION.

State aid to technical education must, according to our contemporary, the *Textile Manufacturer*, 'be regarded as undesirable; and not to it but to other sources must the promoters of weaving-schools and similar institutions look for the means whereby they may carry on their work. These are not so limited or difficult to secure as some seem to imagine. In addition to voluntary contributions, there is a mine of wealth that can and ought to be made available for the promotion of technical education.

'Within the last few months, statements have been made about the increase in the income of the Livery Companies of the City of London, which have had a startling effect upon the public mind; and the more the subject is considered, the more strange does it appear that in the nineteenth century, in the capital of this vast empire, there should be small coteries of individuals, calling themselves by sundry trade names, but having no connection with the trades, administering vast funds upon no defined system, these funds being the accumulation of centuries, and which the present irresponsible administrators have not the slightest right to supervise, beyond the fictitious one of what may be called nominative succession given them by their predecessors, who also had no better title to their position.

'From a Report issued by the London School Board, which has been making inquiries into the City Guild Charities, but has not received any assistance from the Guilds in its investigations, it appears that there are one thousand and eighty charities managed by the City Companies, with an income of upwards of one hundred and eighty-five thousand pounds per annum. This is in addition to the one thousand three hundred and thirty charities under the management of the City parishes, and valued at one hundred and four thousand pounds per annum. Here is an income of more than a quarter of a million pounds at the disposal of irresponsible bodies, and it is said that quite one-half is misappropriated. Take, for example, the accounts of the Mercers' Company, in which three hundred and two pounds nineteen shillings and eightpence is charged for the annual dinner and audit breakfast in connection with St Paul's School. Here is a direct waste of money ostensibly devoted to educational purposes.

'To these endowments must be added a host of others scattered throughout the country, to which the foregoing remarks are in some degree applicable. Some of these have already been brought under the pruning-knife of the reformer. For instance, the Ackroyd Charity, Yorkshire, has been remodelled, and while the original intentions of the founder are carried out in

the new scheme, a large surplus is allocated to the College of Science at Leeds. It is, then, the funds left in many cases for the education of artisans, and misapplied, or for objects that no longer exist, that should be made available for aid to technical schools. Time must elapse before suitable schemes can be decided upon, and even the first step has to be taken, which is, to arouse the attention of the public to the sources of hidden wealth that can be diverted to promote the advancement of technical education, and render unnecessary all appeals for state aid.'

#### WITHERED.

I LIFT them to my drooping face;  
My heart above them grieves;  
Of all their beauty, not one trace  
Lies on those leaves.

And yet, with trembling lip, I kiss  
Each precious withered flower;  
Baptised in tears, I still do bless  
Their gentle power.

For none can know what feelings wake  
In passion'd heart like mine,  
That hounds a trifle for sweet sake  
Of dreams divine;

That gives to dust and ashes Love  
Which live! in Hope's own bower;  
That broods, with yearning pain, above  
A faded flower.

Through shower of kisses, mist of tears,  
There rises from the Past  
A vision that no coming years  
Can overcast.

The small white hand, so soft and true,  
That gave those flowers away,  
Still sparkling with the bridal dew  
Of yesterday.

The smiling eyes, that seemed to gaze  
Beyond Earth's cloudy rim,  
As if their holy power could raise  
Life's curtain dim.

The tender heart, so fain to shed  
Its sunshine everywhere,  
Oh, blossoms fragrantless and dead,  
Yet once so fair!

O flowers, he loved, ye were so bright,  
I took you as a sign,  
For winsome words and laughter light  
With flowers twine.

And flowers, and words, and touch, and tone  
Seemed wreathed around my heart  
In garland immortal, that none  
Might tear apart.

My cherished Hope! my cherished Flower!  
Dear tokens that she gave,  
I lay you—withered in an hour—  
Upon her grave.

## THE CENSUS.

1881.

THE Census of 1881 has been taken, and the result of the labours of the Registrar General and his vast army of enumerators has been embodied in a preliminary Report, which has been presented to Parliament.

The census, as taken nowadays, is a very elaborate and, so far as human ingenuity and patience can make it, a very accurate numbering of the people. The Domesday Book of William the Conqueror was perhaps the first crude attempt in these islands of keeping a record of the numbers and condition of their inhabitants, and, at best, it was but an imperfect undertaking. It was not until the year 1753 that a formal proposal to take a census was made in the House of Commons, and it was then opposed as a project which had for its object the violation of an Englishman's rights and liberty. It was considered by many that the knowledge thus obtained would lead to acts of oppression, such as compulsory service in the army and navy, the exaction of unjust taxes, and many other things of a like arbitrary nature; and one minister was actually indiscreet enough to hint that the census would be used for conscription purposes in the case of a long war. The Bill passed the House of Commons by large majorities, but was rejected by the House of Lords. Fifty years later, there came a scare of another kind, in consequence of many people thinking that the population was increasing beyond the means of subsistence, and a Bill was passed in 1801 for the taking of a census; which was duly effected.

The Census of 1881, which is the ninth decennial enumeration of the population of the United Kingdom, was taken on 4th April last; and so vast are the figures involved in this great national roll-call, that, even with the assistance of a large staff of clerks, it took the Registrar General three months to ascertain the result. The Report embodying that result, and from the pages of

which we derive our statistics, is only a preliminary one, dealing with the actual numbers of the people. In addition to the work of abstracting the totals from the enumeration books and arranging the tables for publication, the whole of the superintendent-registrars', registrars', and enumerators' claims had to be examined and checked, and the payments made; and when we mention that there were six hundred and thirty superintendent-registrars of districts, about two thousand seven hundred registrars of sub-districts, besides thirty-five thousand enumerators, our readers will scarcely be surprised to learn that the time absorbed in this work alone was six weeks. The sum of money paid away for this part of the census was over eighty thousand pounds.

This portion of the work was performed by the Accounts Branch of the Registrar General's Department, with such accuracy of detail, that not a single mistake of any magnitude occurred in the payments in question. For the taking of the census, Parliament last year voted the sum of one hundred and thirty-five thousand pounds. And by way of comparison, it may be interesting to note here that the cost of the American census is seven hundred thousand pounds.

The grand total of the inhabitants of the United Kingdom living at midnight on the 3d of April last, including the army and navy and the Channel Islands, was thirty-five millions two hundred and forty-six thousand five hundred and sixty-two; the preponderance of females over males being no less than seven hundred and thirty-eight thousand six hundred and sixty-eight. The corresponding total for the whole kingdom in 1871 was thirty-one millions eight hundred and forty-five thousand three hundred and seventy-nine; which, when subtracted from the other—allowing, of course, for the decrease in Ireland and in the Channel Islands and the Isle of Man—shows an increase of three millions four hundred and one thousand one hundred and eighty-three. This is equivalent to an average daily addition of nine hundred and thirty-one persons to the population throughout the ten years; the daily increase in the

preceding decade having been seven hundred and five.

The population of England and Wales on the night of April 31 was twenty-five millions nine hundred and sixty-eight thousand two hundred and eighty-six; being an increase of three millions two hundred and fifty-six thousand and twenty over the number for 1871; and showing further an excess of females over males of seven hundred and eighteen thousand seven hundred and seventy-eight. To each one hundred males enumerated there were thus 105.7 females; and the proportion of females to males has, it appears, been steadily increasing at each census since 1851. England alone has a population of twenty-four millions six hundred and eight thousand three hundred and ninety-one; exhibiting an increase of three millions three hundred and thirteen thousand two hundred and sixty over the figures of 1871.

By manipulation of these figures, we find that the density of the population of England and Wales is now about four hundred and forty persons to the square mile, or nearly six times as many as in the days of 'Good Queen Bess.' In 1871 there were three hundred and ninety persons to the square mile in England and Wales; so that there is an increase of fifty to this small area in the past ten years. There is, however, plenty of breathing-room left yet to each inhabitant; for it is calculated that an area of six thousand nine hundred and fifty-five square yards could be allotted to each person in England and Wales.

The great improvements in sanitary science during the past decade are shown by the fact that the annual death-rate has decreased to such an extent, that no less than two hundred and ninety-nine thousand three hundred and eighty-five persons are now living, who, with the previous rate of mortality, would have died.

Scotland contributes to the grand total three millions seven hundred and thirty-four thousand three hundred and seventy, or nearly one hundred thousand less than the population of London! There is an increase for Scotland over the census of 1871 of three hundred and seventy-four thousand three hundred and fifty-two. This is, however, not the case with the sister isle; for Ireland exhibits a decrease of two hundred and fifty-two thousand five hundred and thirty-eight; the present total being five millions one hundred and fifty-nine thousand eight hundred and thirty-nine.

The population of the Isle of Man is fifty-three thousand four hundred and ninety-two; being a decrease of five hundred and fifty under the figures of 1871; and the Channel Islands eighty-seven thousand seven hundred and thirty-one, with a decrease of two thousand eight hundred and sixty-five.

The army, navy, and merchant service give an aggregate return of two hundred and forty-two thousand eight hundred and forty-four; being an increase of twenty-six thousand seven hundred and sixty-four.

Eight English counties have fallen off in their numbers since 1871—Cornwall showing the large decrease of thirty-two thousand eight hundred and fifty-nine. Cambridge, Rutland, and Westmoreland have also decreased to the extent of over one thousand each; and Dorset, Hereford, and Huntingdon by over four thousand. Shropshire has

been nearly stationary, with a slight decrease of one hundred and eighteen.

Lancashire stands first on the list of the counties whose numbers have increased, with a difference in her favour of six hundred and thirty-four thousand seven hundred and thirty. Yorkshire comes next, with an increase of four hundred and forty-nine thousand nine hundred and fifty-four; Middlesex next, with a difference of three hundred and seventy-nine thousand and forty-nine; and Surrey, with three hundred and forty-four thousand two hundred and seven. Five other counties—Durham, Essex, Kent, Stafford, and Warwick—exhibit an additional force of over one hundred thousand; while Buckingham, Devon, Norfolk, Oxford, Somerset, Suffolk, and Wilts have an increase in each case of less than ten thousand—the first-named being only about four hundred.

Wales shows a total population of one million three hundred and fifty-nine thousand eight hundred and ninety-five, of which, like England, the majority are of the fair sex. Of the Welsh counties, six show an aggregate increase of one hundred and fifty-two thousand one hundred and twenty-three. These are: Carmarthen, Carnarvon, Denbigh, Flint, Glamorgan, and Merioneth; the last named but one taking the lion's share, namely, one hundred and thirteen thousand eight hundred and thirteen. The other six counties show an aggregate decline of nine thousand three hundred and sixty-three.

Wherever we find the county areas densely populated, it may be taken for granted that the industries connected therewith are in a thriving state; while those counties which fall below a certain maximum have generally either small manufacturing agencies in operation, or are for the most part, if not entirely, agricultural. For instance, we may take it that a density of two hundred to the square mile would be fair evidence of the presence in such counties of large manufactures or mines; whilst a scarcity of population would denote the absence of such works. Lancashire and Middlesex show a density respectively of one thousand seven hundred, and one thousand three hundred, to the square mile, these counties being those in which the greatest industrial activity is developed; while six other counties exhibit a density of over five hundred to the same limited area.

Amidst all these totals, however, the most remarkable is that of London, which now stands at the astounding figure of three millions eight hundred and fourteen thousand five hundred and seventy-one; thus heading the other towns in the kingdom with the enormous increase of five hundred and sixty thousand three hundred and eleven; which in itself is more than the population of Liverpool, and is equal to the aggregate increase in thirteen of the largest towns in England during the same period. Of this immense total of nearly four millions of human souls, the fair sex predominates to the extent of two hundred and twenty-six thousand three hundred and fifty-nine; there being thus in the Great Metropolis nearly a quarter of a million more women than men. The population of London exceeds that of Scotland by eighty thousand two hundred and one. Its increase alone is a little less than the whole population of Hampshire, and about the same as that

of extra-Metropolitan Middlesex and Hertfordshire taken together, more than half as much as Staffordshire, and four times as much as Herefordshire and Radnorshire combined.

The necessity of having public parks and open spaces in London for the benefit of the health of its inhabitants, is clearly shown by the astonishing fact, that there are no fewer than thirty-two thousand three hundred and twenty-six persons to the square mile, or about fifty to the statute acre! the three portions of the Metropolis situated in Middlesex, Surrey, and Kent having respectively eighty, forty-four, and thirteen to the acre.

The City of London, according to what, for the sake of comparison only, we will term the Imperial Census, contained on the night of Sunday, 3d April, fifty thousand five hundred and twenty-six souls; but, dissatisfied with this manner of reckoning the inhabitants of the world's mart, the Corporation determined upon having a Day Census taken; and this was actually done about three weeks after the government enumeration. The result, which took the City officers three months to arrive at, shows that the commercial and mercantile population of the City on the day in question was two hundred and sixty thousand six hundred and seventy. This is an increase over the total of 1866, when a Day Census was also taken, of forty thousand and eleven. The Imperial Census shows the *residential* population of the City to have decreased by twenty-four thousand six hundred and seventy-seven. This is, of course, accounted for by its merchants and others now preferring suburban residences to those situated among factories and warehouses.

The Metropolis is divided into twenty-nine districts; and of these, Islington, Kensington, Lambeth, and Pancras stood highest as regards numbers in 1871; and now exhibit an increase of thirty-two, twenty-four, seventeen, and seven per cent. respectively, each having, more or less, a population of about a quarter of a million. Eight metropolitan districts show a decrease during the past ten years; while Fulham, which was not regarded as a distinct district until 1879, has the remarkable growth of seventy-four per cent.

The population of London has nearly doubled itself in forty years, and now displays the extraordinary fact, that out of the entire population of England and Wales, a proportion of one person in every seven resides in the 'Great City.'

London contains four hundred and eighty-six thousand two hundred and eighty-six inhabited houses, with an average of about eight persons to each; while there are thirty-seven thousand uninhabited dwellings, and eight thousand in course of erection. The area which may be apportioned to the inhabitants of London gives about ninety-five square yards to each person; but each inhabitant has in the Surrey portion of the Metropolis twice as much room as in the Middlesex part, and in the Kent portion nearly nine times as much as in Middlesex.

Liverpool, the next largest city in England, has a population of five hundred and fifty-two thousand four hundred and twenty-five, and shows an increase in the ten years of fifty-nine thousand and twenty. Birmingham comes next with over four hundred thousand, and an increase almost as large as Liverpool; and Leeds with three hundred and

nine thousand one hundred and twenty-six, and an increase of about fifty thousand. Sheffield and Bristol have an aggregate increase of seventy thousand; and Nottingham shows the enormous growth of one hundred and fifteen per cent. on the return for 1871. Manchester, strange to say, shows a falling-off in her population of nearly ten thousand during the decade.

For the convenience of enumeration, England and Wales was divided into eleven divisions, the Metropolis being one of them, the divisions into counties, the counties into districts, and these again into sub-districts; and amongst the interesting and valuable results to be derived from the census we may mention: (1) The age and sex of the people, the differences in which regulate the strength and development of the nation. (2) The mean age of the population. (3) The actual increase in numbers. (4) The successive numbers in a generation, or those born between two consecutive censuses whose gradual growth as a body can be accurately judged. (5) The conjugal condition of the people. (6) The various occupations, &c., in which the population is engaged, and the number to be ascribed to each.

It is the actual numbers of the population, showing the proportion of each sex to the whole, and the increase or decrease of the population, which are the subject-matter of the Registrar General's recent Report; and the totals were abstracted from the census papers as quickly as possible, for the information of Parliament and the country.

The Registrar General's second and more voluminous Report will not be made until the close of the census, which takes nearly three years to complete, although about one hundred and twenty clerks are daily employed on the work. The magnitude of the task may be imagined when it is stated that there were upwards of seven millions of schedules issued, and that each schedule contains eight columns of information, all of which must be examined, checked, corrected, abstracted, compared, and tabulated with the utmost care and precision, in order that the statistics to be deduced therefrom may be rendered valuable by being absolutely reliable. It must also be remembered that each of these schedules contains a different style of writing, much of it being so bad as to be scarcely readable, while in many instances the most astonishing blunders have been made; such, for instance, as a wife appearing as *head* of the household, and described as a 'male'; while the husband occupies the second place, and is described as a 'female.'

Many hitherto unheard-of occupations have also been discovered by the clerks engaged on the revision, and the strangest possible mis-conceptions of what was required in the geographical and infirmity columns have been to them a source of considerable amusement.

The Secretary and the gentlemen who superintend the work at the Census Office are clerks of the General Register Office, or Registrar General's Department at Somerset House—a Department which has become famous for the reliable and therefore valuable nature of its health statistics and sanitary observations—records that have made the title of 'Registrar General of England' known wherever the English language is spoken.

It is a noteworthy fact, though it is not

mentioned in the Report which we have had under review, that not a single case of prosecution for refusing information has occurred in connection with the taking of the census of 1881; and, as far as can be ascertained, very little vestiges remain of the old prejudices which existed in connection with the subject, and especially with that section of it which dealt with the ages of the fair sex. On the contrary, the work of the enumerators was everywhere lightened by the fact that the lapse of a hundred years has created a radical change in the minds and manners, in the feelings and prejudices of the English people; while the spread of education has enabled the nation to measure its own strength, and to fling aside any childish fears of invasion or oppression, knowing full well, as the humblest working-man does, what would be the fate of any minister, or ministry, who ever attempted, by means of the census, to violate the first principles of the Great Charter.

We have thus far, then, given our readers an epitome of the results of the recent numbering of the people in these islands, and the nation may be fairly congratulated on the fact that it is still making a steady advance in the path of prosperity: for growing numbers must, mean, to a certain extent, increase of wealth, and of that natural and physical strength upon which the happiness and material progress of a great empire mainly depend.

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER XL.—IN THE TRAP.

It was quiet, very quiet, in the great Yard of Mervyn & Co., that had rung all day long to the clink of hammers and the resonant boom of mallets beating merrily on hollow ribs and decks of sound oaken timber. The workshops were empty; so were the slips; so were wet dock and dry dock; the men were gone; and the machinery awaited the potent touch of Steam to give it life again. Very gently, a side-door—the same by which, a day earlier, Mr Weston and his searchers had found ingress—turned upon its well-oiled hinges to give admission to four men, who crossed the Yard in Indian-file, one by one, keeping as much as possible in the shadow of the buildings on which the sickly moonlight played. Bertram Oakley went first. Close behind came Inspector Birch. Two constables of the Southampton police, in their greatcoats, belted, and with cutlasses dangling from their belts, brought up the rear. With cautious tread, with bated breath, the three policemen followed Bertram as he led the way, head-fully, towards the Fittings Store. The whole quartet, as they stole across the Yard, would, to an unprejudiced eye, have had very much the air of night-prowlers. Thief and thief-taker must sometimes look alike. By Bertram's advice, the whole four ensconced themselves—two to the left, and two to the right—behind the piles of timber, beam and mast and spar, heaped and stacked in convenient profusion on both sides of the warehouse where the Fittings were kept. To the right were hidden, behind beams and keelsons and knee-timbers, like a dead grove of leafless trees, Bertram and the Inspector. To the left, behind the

rounded shapes of many spars, lurked the armed constables, armed, because who knew how fierce, or against what odds, the struggle might be?

Then came a period of waiting, with all the tedium, disappointment, uncertainty, that waiting implies, when nerves and brain and eyes grow weary, and incredulity begins to reign paramount. Would they never come? The private policemen fidgeted in their ambush. Inspector Birch muttered beneath his breath ejaculations anything but complimentary to his own wisdom. Bertram was the first to hear the faint sound of feet trampling the gravel. 'Hush!' he said, laying his hand on the detective's arm. On they came, with stealthy tread, through the shadows of night, those who were expected. One, two, three, cautiously, but without hesitation, they approached the Fittings Warehouse. A well-built, active figure led the van. Next came a shorter man in dark clothes, like the first. A tall form, clad in a light-coloured suit of slops, like a common labourer, followed. This man carried over his arm some empty bags or sacks.

'The glim!' whispered the leader, as the door was gained. The tall man in the slop-suit shuffled forward in his nailed boots, and, producing a dark-lantern, struck a light. The shorter of the two who wore broadcloth drew forth a key, and, with a practised hand, thrust it into the keyhole, and threw open the heavy door. What white face was that which gleamed, ghastly, as the glare of the lantern fell upon it! and what smooth voice was it that said, in low accents, but with a chuckling laugh: 'This last job *must* clench the business! We have but to leave the door open, and when the Governor comes to-morrow, with that owl of a detective, it'll be all U.P. with the upstart Oakley—ha! ha!'

'It was a good plant, Judas, about the —,' answered the taller man, as he passed in, close on the heels of the first; and behind came the shambling figure in the slop-suit. As the words were uttered, Bertram could not help tightening the pressure of his hand on the Inspector's arm. He distinctly felt the angry movement which evinced the detective's disgust at being called an owl; but, to the young man's surprise, his practised companion remained passive; and the two policemen were as still as if they had been two of the wooden figure-heads of ships, many of which, gay with paint and gold-leaf, stood near. There was another period of expectation, during which smothered sounds of talking and laughter, and the clatter of metal, and the tink, tink of a hammer, were faintly heard from within; and then, at last, stealthy steps approaching the door. Laden with booty, each with a weighty bag in his hands, the three figures darkened the doorway.

'At 'em!' cried the Inspector, unconsciously parodying the Great Duke of Wellington's most celebrated speech, and dashing forward. There was a flash of bull's-eye lanterns suddenly displayed; there was a scuffling and a kicking up of the gravel, and sacks were dropped, and blows struck, but not many, for the contest was soon over. Almost instantly, the Inspector had Crawley by the collar, and, though the wretch struggled like a writhing eel, he was secured. Bertram made prisoner the tall fellow in the slop-suit, who had already tripped up the heels of the constable who clutched him. But the third man, who was no

other than Nat Lee, after fighting for a moment, changed his tactics, and darted off, like a deer before the hounds. He was pursued; but in vain; for in a moment he was gone, as though the darkness had swallowed him up; and immediately afterwards the distant splash of oars reached the ears of his baffled foes.

'A boat, hey!' muttered the Inspector. 'Well, well, my gentleman, if you don't find Southampton too hot to hold you, my name is not John Birch.—Clap the darbies on these two, anyhow!' And the steel handcuffs closed, with a satisfactory snap, on the wrists of the captives.

'Lock the door—give me the key, Parsons.—That's right,' said the Inspector jubilantly. 'Pick up two of those bags, men. The other we can leave where it is. Late as it has got to be, we'll have them up to Mr Weston's house. It's irregular, very; but it's a rare success. Never knew such a game in the three-and-twenty years I have been in the Force—never!'

## FILLING LITTLE PITCHERS.

### IN TWO PARTS.—PART II.

How far should little pitchers be filled? Need they be brimful? As it happens, we do know of some little pitchers that somehow got filled astoundingly full; we only know of them in books, yet in such grave books, that surely it must be true. In Macaulay's time, every schoolboy knew everything from the Middle Ages downwards, and from here to the utmost limits of British India. Nor did the erudite schoolboy become extinct until later. The greatest modern art-critic declares that every schoolboy knows that the epithet of 'learned' was given to Poussin in allusion to the profound classical knowledge of the painter. But if ever there were such schoolboys, we congratulate ourselves that the race is now at least extinct, like the antediluvian giant lizards and the mammoth creation. Possibly, grave as our authors are, the schoolboy who knew everything is a fabulous animal, a unicorn or dragon of schoolboys, whom we need not fear to meet, yet whose name may survive to adorn an essayist's page.

As a matter of fact, the schoolboy at the end of his course of study, the girl in the glory of having acquired every 'accomplishment' at a finishing school—ay, and the university student with his fresh laurels, and the student of sixty, the Magliabecchi living and having his being among his books—all know but a very little of the vast everything that can be known; and their science may be measured upward by their growing sense of the finite littleness of their knowledge, their willing acknowledgment of deficiency. Again, just as it is true that the great point is not to talk of attaining 'much learning,' but to learn our own little well and suitably to our aim in life, so is it also true that even in learning that little, there is diversity of mind and of capacity; and as to talent, it may be expected of one in ten; but genius—of one in ten thousand.

Parents, proud of their children, have an unfortunate knack of believing that genius has been born to them, mistaking their more intimate knowledge of their own children for an unusual display of mind and character in the

children themselves. Pride or fondness such as this produces those disappointing failures, whom the world knows as the clever children that subside into commonplace folk. Would it not be more true to talk of the ordinary children who had been induced for a time to be clever—to attempt things beyond their power? There are boys who think themselves poets, and bitterly regret the knowledge in after-years that their juvenile verses exist scattered somewhere in print. There are girls who were renowned for their wit as children, and who, unfortunately, in later years have no way of knowing that their sharp remarks were only impertinent criticism, the early seed of the habit of clever, unkind criticism and mimicry, that now makes them feared in society—not loved and trusted. Boys, too, are expected to be born to write 'like copperplate,' as old-fashioned school-masters would call that species of perfection, born to be classical scholars, and expert mathematicians. Girls are supposed to be endowed by Nature with a musical ear and an aptitude to be musicians. And while the boys become young rebels under constant blame for their stupidity, the girls take a few music lessons, and torture their friends for evermore with anything but music on the piano. A girl who has the sympathies, the ear, the training of a musician, is indeed a treasure in a household; but many hours would be saved for other study, and much torture to other ears avoided, if parents would sometimes face the fact, that their child has not capacity for music; or perhaps, that she has a correct sense of sound and harmony, but has not the necessary mechanical power.

Granting that it is foolish to try to force every child to be a genius or a Hercules in school-tasks, and granting that the most that can be learned in a few years is but very little; we are inclined to believe that the best thing learned in school-hours is *how to learn*. How to read, and how to learn—that is the most the first few years of life can teach. Give the child a firm beginning for his knowledge, a strong skeleton to build upon and cover in—like the skeleton of beams, the keel and ribs, grandly shaped and riveted together, upon which are to be laid afterwards the planking, the sides, and the stout bulwarks of some ship that will have to voyage long in the great sea. Give him for his history, not dates and names alone, but a broad outline of the centuries, a story of the causes and events that shaped the world; and into this what he reads and hears will fit, and take due place and form. Give him for geography, not where remote rivers rise, and how many square miles far-off countries measure, but a picture description of the world, a knowledge of what the countries are like, and their people, what is made there, to whom those countries belong, what grows there, and how the round of life is lived. As to retaining of the names of places, and their position, much will depend upon the habit of taking the map and finding the towns, or rivers, or mountains named, whenever such names occur in the reading of any book. Every other branch could be treated in the same intelligent and attractive way.

The real education of most men comes after school-days are over; and whether self-education goes on at all, or what course it takes, depends

upon the outline of school studies, the love of serious study that a good teacher developed, and the noble choice of books which a wise teacher indicated. The over-teaching of a child will lead to less education in the end, because less self-education will follow. 'The way in which they forced him to study,' wrote Madame de Caylus of Louis XV., 'gave him such a disgust for books, that he took the resolution of never opening one again when he would be his own master; and he has kept his word.' How many boys and girls do the same without taking the resolution! They have been disgusted with serious study; and a newspaper and a novel are the only literature for which they have appetite. They are like Louis XV., that little pitcher that was filled brimful, and that tossed out the contents again with the royal privilege of self-assertion. What if, after all, some of the best pitchers were not filled brimful? What if some of the noblest natures were not clever in learning, nor brilliant with genius? If children do not show signs of such gifts, why should we force them, why should we regret it? There are better gifts—far better. Look at that man who is welcomed everywhere for his happy humour, loved at home for his kindness, honoured abroad for his integrity, his hard work, his bravery of spirit in misfortune—a greater bravery than courage on the battle-field; and yet probably he had no great name in his school and college, beyond being an ordinary boy on the list, with ordinary abilities. And see that girl, who promises to make some day the angel of home, a woman full of kindly helpfulness and sweetness, and capable of the heroism of self-sacrifice—the commonplace girl who tried Latin three times and could not get past the declensions; and whose chief musical qualifications find an outlet in humming her baby-brother to sleep.

And lastly, with what are the little pitchers to be filled? 'Ah!' said a white-haired country-woman the other day, talking about her schoolboy grandson—one of some thirty grandchildren scattered in prosperous humble homes through the green shires of Southern England—'Ah! they ought to keep him at school. It's all the scholarship nowadays. It's different from when I was young. Everything's in scholarship now!' But is everything in 'scholarship' now? we thought, looking at this homely old lady's gentle blue eyes—a pair of eyes that keep the light of love yet, far on into the happy winter of a good, hard-working, simple, cheery life—is everything in 'scholarship?' We know that the poor thirst to push their sons and daughters upward; they have a generous desire that their children shall enjoy the good things which were not within their own reach. They are anxious for their children to be what they call scholars, and they work with a touching self-denial to give them this 'scholarship,' with its vague visions of future tangible advantages. But in many cases sorrow lurks behind the delusive promise that their children's good depends upon literary proficiency, and that they will be happier for stepping up with their own children's children to rank among the educated and to be of a higher class.

Out of this idea of pushing upward comes the lamentable impression that manual labour is degrading, that a man who works at a trade, and

a woman who earns her way, are inferior to people of similar education and birth who do not work with their hands. Out of this idea also comes the filling of offices with ill-paid clerks, the overcrowding of clerks, till a man who has 'scholarship' is worse paid at his desk than if he had been a cabinet-maker or a mechanical engineer, or a skilled factory-workman. To the same causes too must we attribute the ever-increasing number of governesses and teachers, who can hardly hope to find employment. The opening of many trades to women as workers, is a step in advance, and may possibly save much of the misery that arose from the old idea that a dowdier girl degraded her family in social position if she sought any employment except teaching.

Now, to return to our little pitchers. Children are not all to lead the same kind of life. They have diversity of powers, and the great aim must be their perfect, solid preparation for the kind of life to which they are destined. Education is not book-learning alone; that is a low idea of it. Education is 'a building-up.' It is the discovery and training of the child's gifts, the development of what is good, the casting out of what is evil. And we take it that the labourer's child who is taught our five Rs—Reading, Writing, Arithmetic, Respect, and above all Reverence, and who is also taught the work he is to do, has received as serviceable an education as the heir to a baronetcy who wins the honours of a university career. Of course, if the child of the poorest is gifted with great talents, he should have it in his power to find development for them in the highest kind of education; such talents carry with them a taste and aptitude for study. Such a child should be given every help to find his level; and find it he will, though he be the son of an illiterate labourer. For the rest, the mental work of study constitutes a useful exercise of the mind, but useful only in proportion as it is suitable to the future position and occupation of the scholar. In a word, the excellence of education is to be estimated not by the amount learned, but by its efficiency as a preparation for the child's after-life. A perfect education in whatever class it be, is simply the perfect preparation of the child to enter upon his life's greater tasks, to live a noble and useful life though the most obscure, filling his allotted place worthily, loyal to God and conscience, loyal to home and country, loyal to his neighbour and to his life-work. Can anything be higher than this? And yet the little pitchers have to be filled with many other things beside 'scholarship,' if we wish them to realise this grand ideal.

There is something else to be trained beside the memory and understanding: it is the will. The little ones have to be taught to distinguish and choose the path of duty. Begin by teaching them while they are still very little children—teach them practically, not drily and severely, but gaily and sweetly, that 'the path of duty is the way to glory.' Teach them, too, unselfishness and generosity, knowing that all through life, and every day of life, they will have need of others, and others will have need of them. Teach them that, nevertheless, all life long they must be ready to rely on self-help; and the lessons in self-help should begin with little things—the little everyday needs of life. Man's self-help is to be after-

wants exercised in making his way through the world. But woman's self-help will mostly have home for its sphere; and at home our wee women should learn early the self-help that saves trouble to others, and that gives promise of a good housewife by-and-by. The children of the working classes, and of the upper classes too, would benefit by such teaching. As an example: girls learn to sew at school with microscopic neatness; but they seldom learn to 'cut out,' and to make wearing apparel tastefully from patterns; yet many of them will a little later have the whole care of making their own dress; and as mothers, if they need to economise, they will have to devise, fit, and make the dresses of their children. There are many more household arts which girls ought to learn; and just as it is said that a young maiden's drawer of ribbons and gloves is a picture of the order of her future house, we may say that a child's eagerness to help practically in little things, is a picture of the grown woman's power of helpfulness.

With such thoughts in mind, we gravely suspect that some things better than scholarship may have been learned by our old friend the grandmother, worn of face, white-haired, blue-eyed. She has scholarship enough for reading aloud on Sunday evenings, and reading pleasantly; for we have heard her voice when we passed the open door. She knew enough for the straw-plaiting of her native village, and for the making of pillow-lace—lace that was worn out by fair ones somewhere about threescore years ago. She knew enough to be interested in her husband's work; to be glad of his skill in a cottage fruit-garden; to bear him untiring company in old age; to nurse him in his sickness; and to retain his memory tenderly, though in a plain and simple way, in her faithful heart. She knew enough to work through a long life of industry, and to see her children's children all growing up with family traditions of reverence, honour, mutual help. She is the type of thousands more. The lack of 'scholarship' does not seem to have made her eyes less gently loving to the last; nor to have left her old age less active and helpful and bright; nor to have marred that humble life-work that is so unconscious, so complete, so enduring. Perhaps, after all, the great thing is not to fill our little pitchers roughly and hastily and brimful, but to secure for them a little of what is truly good, to instil into them some drops of unseen worth, to think only of filling them so that they may stand nobly.

## TOM'S WIFE.

### CHAPTER IV.

It was with a strange sense of something unexpected going to happen, that on the Friday morning I alighted at the door of the Atheling Manor-house, and followed the servant into the library. The Squire was there, and received me with a degree of cordiality which to me seemed but affection in the love-entangled old man. Madame Favre, and her maid along with her, were there also; and she returned my bow with a graceful inclination of the head, and a patronising air, as if she were already lady of the house. Yet I could

not help being less favourably impressed with her appearance than when I was first introduced to her in her own house; and there was a certain furtiveness in her look, something half-sinister in the expression of her face, which I had before remarked, though not so strongly; yet on second thoughts I was disposed to lay these bad impressions at the door of my now personal prejudices against the lady, as having been instrumental, though maybe unconsciously, in the unnatural separation of father and son, both of whom I had long known and loved, while she was but the stranger of a day.

She was certainly a beautiful woman; and the taste and elegance with which she had attired herself for this occasion, set off her fine face and figure to unusual advantage. Indeed, I could not look at her without a feeling of intense surprise that a woman so accomplished and handsome and wealthy should throw herself away upon a gentleman more than twice her age, and who would have better suited the relationship of father to her, than of husband. But these were all matters with which I had nothing practically to do; and after our first brief salutations were exchanged—for I was not in a mood to converse much—I proceeded to business.

Having meanwhile dismissed the maid—who was to be afterwards a co-witness with myself to the signing of the contract—I read the document aloud. The Squire and Madame Favre both expressed themselves satisfied with its provisions. I thought I could detect the Squire rubbing his hands together under the table, as I read the clause which made him absolute owner of the forty thousand pounds which constituted Madame Favre's fortune; and I was sure that *here*, and nowhere else, lay the world-loving old man's pleasure in the marriage he was thus contracting. When I had done reading the paper, Madame Favre's maid was re-called, and the Squire proceeded to subscribe his name in due form. The lady rose, and was coming forward to do the same, when, just as I was placing the deed in position to receive her signature, the quick rattle of wheels was heard upon the gravel outside, and in another minute a carriage passed the window, and drew up at the door. The lady's glance turned towards the window, and I thought, as the vehicle passed, that a peculiar, wild gleam came into her eyes—but whether of fear, surprise, or annoyance, or all three combined, I was unable to determine. She, however, took the pen in her hand, and was proceeding to sign, when the servant entered the room, bearing a visiting-card upon a silver.

'Why—Jack Silverton!' exclaimed the Squire, as he took up the card and looked at it; 'what can have brought him here at this time?—Tell the gentleman,' he continued, addressing the servant, 'that I shall see him very shortly.'

'Please, sir,' said the man, 'he says he must see you at once, as he has business as is of importance.'

'And so have I,' remarked the Squire, with a look and smile towards Madame Favre; 'and Mr Silverton, though an old friend, must bide his time. Deliver your message.'

Madame Favre, who I could see was not a little agitated for a few minutes, appeared to regain her composure; and standing with pen in hand, she heard the Squire explain to her that 'Jack Silverton,' as he called him, was one of his oldest and best friends, whom he had not seen for many years, owing to his residence on the continent. He was going to tell of their early friendship and some of its events, when the servant again entered, with a scrap of paper on the tray, on which were pencilled a few words. The Squire read them, and with an expression of impatience on his lips, begged the lady to excuse him for a minute, until he had spoken with Mr Silverton, whom he would presently beg leave to introduce to her.

As the Squire left the room, Madame Favre laid down the pen, and quietly resumed her seat. I watched her as closely as I could without making my attentions marked, and I was certain she did not feel comfortable under this interruption. Nothing was said by either of us. I busied myself, or professed to busy myself, with the other papers I had brought along with me. The minutes seemed to pass with tenfold tedium. The great marble clock on the chimney ticked with redoubled loudness, and no other sound was heard about the house. It struck me as being like the silence that precedes death, or the hush that foreruns a thunderstorm, or the deceptive lull that ushers in some great catastrophe. I felt painfully uneasy; and, rising from my seat, walked forward to the window, and looked out upon the pretty lawn, in the hope of diverting my attention from the gloomy spirit of foreboding that somehow or other had settled down upon me.

The Squire had been absent about ten minutes—possibly not so long, for each moment seemed a minute to me—when the servant returned to the room, and said his master wished to see me. Taking the precaution of refolding the deed and placing it in my pocket, I followed him, wondering within myself, as I crossed the long hall, what was to be the upshot of this day's singular proceedings.

As I entered the drawing-room, my eyes fell on the Squire. What had come over the man? Seated in a large arm-chair, his whole demeanour betrayed nervous agitation. Near him stood a gentleman whom I had not before seen. This was Mr Silverton. Opposite to the Squire sat a tall, middle-aged lady, with a matronly aspect, and dressed in mourning. What was my astonishment when I heard her introduced to me by the name of Madame Favre!

'Madame Favre!' The exclamation was off my lips before I was aware.

'Yes, Mr Woollaston,' said Mr Silverton; 'this is Madame Favre; and my old friend here has, I fear, been led upon very thin ice, from which I am thankful to have been able to rescue him in time.'

The Squire sunk his head in his hands, and groaned as if in humiliation and agony. I asked Mr Silverton for some explanation.

'Only a very few words are necessary,' said he. 'The woman whom you know under the name of Madame Favre is an impostor—a mere com-

panion, I believe, who, among other misdeeds, after robbing her mistress in Paris, abruptly decamped, to prevent the disclosure of a scandalous tale.'

I was so astonished as to be scarcely able to speak. At length I asked, had we not better secure the woman?

'By all means,' said Mr Silverton. 'Order a servant to take up his position at the door of the library, and let us know in the case of her wishing to leave the room.'

I did as suggested, and was back to the room in a minute. The Squire still sat with his head sunk on the table, utterly overcome with shame and mortification. His temporary triumph over his son had been bought at an awful price to his feelings at this moment.

I shall now explain in a few words how Mr Silverton and the real Madame Favre so opportunely arrived upon the scene. It was, I am thankful to think now, through my letter to Tom. A few days before he received it, he had seen in the list of those attending a grand *fête*, the name of a Mr Silverton, and he remembered this as the name of one whom he had often heard his father speak of as one of his earliest friends. He resolved to search him out; and in this was successful. He found Mr Silverton extremely kind, and much distressed to hear of the breach that had taken place between him and his father.

'I feel all the more regret,' said he to Tom, 'because, in my younger days, I joined with others of my family in repudiating a brother who had married, as we judged, beneath him. I never saw his face again, and he must, I fear, be long since dead; and for years I have diligently sought to find some later traces of him on the Continent, but in vain. I trust your father will never feel the remorse I have often felt.'

On the receipt of my letter as to his father's engagement, Tom again waited upon Mr Silverton. The latter gentleman read the letter carefully till he came to the name of the lady—whose name Tom had not in his former conversations with him happened to mention—when he at once exclaimed: 'Why, I know the lady. I saw her in Paris within these few weeks.'

'That can scarcely be,' replied Tom; 'she has been at Atheling for some considerable time.'

'There is some mystery then,' said Mr Silverton. 'Let us go at once and see into it.' And they thereupon got a conveyance, and drove to Madame Favre's residence.

It was, as had been suspected, and as related above. The woman whom Tom's father had pointed out to him as Madame Favre, was an impostor; and Tom determined that immediate measures must be taken, or his father might be made the victim—as he was in reality very nearly being made—of the woman's deceptive and practised wiles. The woman's real name was Miss Emma Farthing, and had no connection with Madame Favre, except that she had once been that lady's companion, and had robbed her, and absconded.

All this was told to us in a few minutes by Mr Silverton; but still the Squire gave no sign of recovery from the stupor of agony into which the revelation had cast him. He only groaned as the character of the woman who had deceived him was repeated in his hearing.

'But are you quite sure,' I asked with lawyer-like hesitation, 'that this person we have known as Madame Favre is the Miss Emma Farthing whom you refer to?'

'The best way to settle that,' said Madame Favre, who had not hitherto joined in the conversation except by occasional tokens of assent to Mr Silverton's statement—'the best way to settle that is for us to confront the lady, and see for ourselves.'

'Yes, that is right,' said Mr Silverton; and I led the way to the library. The Squire, however, remained seated where he was.

Outside the library door, the servant was standing as directed, and he opened the door as we approached. I entered first, but only to find the room empty! The birds had flown! But how? A glance at the half-open lattice showed that while the footman had been keeping watch outside the door, the two ladies had quietly stepped out and escaped by the lawn. This was proof sufficient of the identity of the lady with Miss Emma Farthing. I could now understand the wild, confused gleam that had lit up her eyes half an hour before as the carriage passed the window—she must then have obtained a glimpse of the lady she was personating, and knew that her destiny was sealed. Further, I was now able to appreciate the lady's extreme liberality in making an absolute conveyance of all her pretended property to her prospective husband; and her cleverness in arranging that her income should be secured upon the broad acres of Atheling. My blood rose against the sleek and supple deceiver, as I pondered upon all that had taken place, and especially upon the fact that for such an adventuress the Squire should have turned his only son out of doors and executed a deed of disinheritance against him.

My first impulse was to give orders that the woman be followed and detained till she could be handed over to justice. But Mr Silverton, wisely as I now think, said: 'No; let the wretched creature go. Her apprehension would only render the matter public, and my old friend the Squire is already humiliated enough. But it would only be prudent to see that she leaves her present place of abode on the estate as she found it; and for that reason, it would not be amiss were you to step thither and see to this, while I go back to the Squire and make some endeavour to alleviate his present anguish of mind.'

Acting on this suggestion, though an hour had by this time elapsed, I took my way to the dower-house where the spurious Madame Favre had hitherto basked in the sunlight of her temporary good fortune. I felt that I also had been imposed upon, and was consequently in no pleasant frame of mind as I walked towards my destination, and was prepared, if I found the impostor there, to speak some very sharp words. But my preparations were unnecessary. As I might have thought, the lady was too much an adept at her trade to linger long on the skirts of detection. Her maid-of-all-work, the village girl formerly alluded to, was now sole occupant of the house. Her mistress and the maid, she told me, had hurriedly collected together whatever was portable and of value, and were now off! 'Bold-faced minx!' I exclaimed, as I picked up from the floor the

miniature of the soldier—her 'dear dead husband'—that had stood on the mantel-piece. I need not add that the discarded portrait had been stripped of its expensive frame; and the little phaeton which had been placed a week ago at her service by the poor cozened Squire, had been put in requisition to bear her and her spoils to the nearest railway station. I could not, however, help feeling glad that she had escaped; for now, thought I, nothing will surely intervene to prevent the old man from being reconciled to his son, unless—and this was still a serious question—the fact of his marriage with a penniless and friendless girl should be more than the father could ever forgive.

On my return to the Manor-house, I found the Squire somewhat recovered from the first shock which the revelation had given him. Mr Silverton and he were conversing together; the former having taken the method that is often the best to restore the mind of the despondent to something like animation—he had engaged him in conversation about matters quite foreign to that which had given him pain. Mr Silverton at once addressed me.

'I have just, Mr Woollaston, been telling my old friend some of the passages of my life during the many years which have intervened since I saw him last; and in the meantime, as he insists that I should remain with him for a few days, I have given orders that the conveyance be sent back to the village for my wife and daughter, whom I had left behind me till I found how things were situated here. Madame Favre has also returned with the carriage; as she is afraid this impostor may have been making use of her name in London, and she hurries thither to put her agents on the alert.'

The very reference to the woman who had so befuddled the Squire gave him, I could see, the greatest uneasiness, and he sat for a minute with downcast eyes, but without speaking a word. At last, as if anxious to divert the conversation into other channels, he said: 'You mentioned your wife and daughter, Jack; I thought you had no family.'

'Nor had I till lately,' said Mr Silverton, with a smile. 'And I will tell you how an old couple like my wife and I come to have a daughter now. You have often heard me speak of my brother Charles. You know he was wild and foolish, and that in his youth he made a marriage abroad which so annoyed and irritated his father, and, I must admit, the whole of his relations, that we discarded him for ever. I cannot now think of our harshness towards the poor fellow without remorse; for, with all his faults, he was still one of ourselves—our own flesh and blood—and no such violent rupture ever comes to good, or gives us peace, however much we may think ourselves justified at the time in making the breach.'

At these words, I thought I could see the old Squire wince. 'He must,' I said to myself, 'be thinking of Tom.' Mr Silverton went on:

'A few years ago, after we had long lost sight of my brother, and being ourselves childless, a strong desire took possession of me to take some steps to try and discover whether he might still be alive, and what condition he might be in. After a weary, and for a long time a fruitless search, I succeeded in discovering the small town

in the north of Italy where he had been married, but found that the marriage had been carried out under an assumed name. He had dropped the name of Silverton, and taken that of Cleveland. I ascertained the name of his wife also; but yet it was long before I could trace him with any certainty; and at length I found that he had lived for a few years within twenty miles of Paris, where he died. From this point all traces of him were lost till very recently, when, by a happy chance, I found a family of the same name in Paris, among whom was a sister of my brother's wife, who had in her possession the proofs of his marriage, and what was of still more interest to us, was acting as the guardian of his only child, now an orphan. This child, a lovely girl, who had inherited her father's handsome features, was like a restoration to us from the grave; and after satisfying ourselves as to the fact of her relationship to us, my wife and I resolved to adopt her as our daughter, and make her the inheritor of our possessions.—All this happened so very recently, that it almost seems to me more of a dream than a reality; for you may be sure we are very proud of our young charge. But I need not say more, for I hear the conveyance approaching with them.

As he said these words, he walked quickly out of the room, in order to receive the visitors in the hall. The Squire rose from his chair also, and made a step or two forward, as if to bid them welcome. At that moment Mr Silverton appeared at the door of the room, leading in a young lady. Close behind him came an elderly lady, whom I rightly took to be Mrs Silverton, and I could not help observing that there was an arch smile on her happy face. When I looked again at the young lady on Mr Silverton's arm, I almost cried out with surprise. It was Jessica!

'Mr Atheling,' said Mr Silverton, as he came forward towards the Squire—'this is our daughter Jessica—Tom's Wife!'

For a second or two the old man stood as if in bewilderment; but as the beautiful girl approached him and sank on her knees at his feet, he took her by the hand and raised her up, and I could see there was a tear upon his cheek. 'My dear,' he said, 'I have been a foolish old man; but God bless you; and tell my boy to try and forgive his deluded old father.'

Before she could answer, a step was heard entering the room, and Tom himself stood before us. His father advanced to meet him, took both his boy's hands in his, and it could be seen that he was making a strong effort to control his feelings. In this he only partially succeeded; his words were but few, and uttered in a quivering voice. 'Tom,' he at length said, 'you must never leave me again.'

I need not dwell upon the happiness of this reconciliation. In answer to my subsequent inquiries, I discovered, what Mr Silverton did not fully state to the Squire in his first conversation, that it was through his finding of Tom, and that the name of the lady whom Tom had married was Jessica Cleveland, that Mr Silverton regained the dropped clue in his search for his brother's child. Jessica's mother had never been aware of the fact that Cleveland was only an assumed name on the part of her husband, and died without making the discovery. This was left

for Mr Silverton to accomplish; and by it, as we have seen, happy results followed. Father and son at Atheling once more understood each other; and next to his love for his boy is his affection for the sweet and unassuming girl, whom the old man delights to speak of as 'Tom's Wife.'

## TEA AND SILK FARMING IN NEW ZEALAND.

### CONCLUDING ARTICLE.

THOSE of our readers who have felt interested in the subject which heads this paper, will probably be pleased to learn what has been done in the matter beyond its advocacy through the medium of the press. On the 3d July 1879, a correspondence was commenced with the New Zealand government through the Agent-General in London, in the course of which, by means of private letters and published communications, an epitome of the design was almost simultaneously laid before the authorities and public here and at the antipodes. Several objects were sought to be attained by this method of procedure. The proposal to farm tea and silk as a combined industry being novel, it was felt by the promoters that every possible source of information available ought to be investigated and utilised; and that, concurrently with approaches to the New Zealand government, there should be appeals to the general public, so that a wholesome action and reaction might result.

In the early stages, not much was expected from the colonial authorities beyond information; but a great deal was anticipated from intelligent colonists, many individuals among whom knew the antipodes and their capabilities thoroughly, and might either stamp the scheme with their approval, should it seem to possess the elements of success, or extinguish it if unworthy by their adverse criticism. Nevertheless, something was looked for from the government, such as the promise of support, either pecuniary or otherwise, after the example of the India and continental powers, which for many years had been aiding tea or silk farming, or both, in their respective countries out of public funds. A hope was also entertained that a newspaper correspondence, starting simultaneously at populous centres in each hemisphere, might have the effect of exciting curiosity concerning various important yet neglected openings for colonial enterprise, and stimulating capitalists to examine the claims and attractions of other commercial products than the ordinary grain, wool, timber, and metals which had hitherto engrossed their attention in New Zealand. Another interesting anticipation consisted in the prospect of employing educated women and girls, who, through misfortune, had become reduced in circumstances.

Regarding the enterprise itself, its leading features may be thus briefly sketched. It has been suggested that the operations should be undertaken by (1) A sufficiently wealthy syndicate, to be incorporated under the Companies Acts of 1862 and 1867, by the title of 'The New Zealand Tea and Silk Company (Limited).' (2) That the authorised capital be one hundred and fifty thousand pounds, in five hundred shares of

one hundred pounds, or fifty thousand pounds fully paid up on allotment; with power to issue mortgage debentures for fifty thousand pounds, at the end of two years, or immediately after the financial result of the first silk crop shall have been ascertained; and to issue further debenture bonds for fifty thousand pounds on the expiry of four years, or directly the first tea-crop has been realised. (3) That the Company be administered in the United Kingdom by a Board of Directors, and in New Zealand by a Manager and Board of Advice. (4) That the special aims of the Company be the acquisition of eligible lands, forests, and running streams for water-power; the erection of suitable buildings and machinery within the province of Auckland or elsewhere in New Zealand, for the purpose of conducting the farming and production of tea and silk, and any other articles of commerce which may be found desirable; and (5) keeping in view the circumstance that the successful establishment of such a group of industries in any district would probably raise the value of all adjacent lands, that, in order to obtain a share of the anticipated advance, the functions of a Land Settlement Association be assumed, by the further acquisition of a surrounding area of perhaps thirty thousand acres; to be secured, if possible, on similar terms to those granted to the corporation in the district of Rangitikei known as the Manchester Settlement.

Putting aside in the meantime this last item, and limiting our attention to the farming scheme alone, the following is an epitome of how the enterprise might be commenced and conducted upon an area of three thousand acres, costing, probably, about six thousand pounds. The first operation would be to provide for the food requirements of the future by the cultivation of two hundred and fifty acres as a permanent cereal and root farm for the maintenance of the employes and draught animals on the estate. Coincident with this work, that of tea and mulberry planting, at the rate of one or two hundred acres of each per annum, might be prosecuted; the remaining land, except a tract of forest to be kept for the supply of timber, being thrown into wheat; let to tenants for grazing or other agricultural purposes; or partly devoted to the subsidiary industries presently to be described. Meanwhile, the erection of the necessary buildings, such as houses, cottages, and other tenements for the employes; stables, barns, stores, sawmill, workshops, tea-houses, laboratory, and magnaneries or silkworm nurseries could be undertaken as required; and the whole so timed, that the arrival of the special apparatus from home, would be coincident with the completion of the premises for their reception, and with the period for their employment.

Among the *subsidiary* products to which portions of the spare land might be devoted, allusion need only be made to five: Small Fruit, Honey, Oranges, Vines, and Olives, all of which, being usually more profitable than cereal farming, might take the place of grain, except on the permanent farm.

Speaking of the first of these products, one of the witnesses examined last year by the New Zealand Colonial Industries Commission, stated that an ordinary crop of small-fruit—berries of

various kinds—would be about six tons per acre. Sold at the nominal price of three-halfpence per pound for preserving purposes, such a crop would yield a net return of fifty pounds sterling per acre. He also said that were fruit-preserving factories established, one man, attending to three acres of small-fruit—which he could easily accomplish—would be better remunerated than the farmer of fifty acres in grass or under the ordinary crops. At present, for want of such factories, immense quantities of the finest cherries, peaches, currants, brambles, and other fruits in favour for preserving, annually rot on the trees and bushes; and whilst the New Zealand public are paying at present a sum of over ninety thousand pounds a year in the home and Australian markets for similar tinned and bottled luxuries, these could be produced at a vast saving at their own doors.

Bee-keeping is still in its infancy at the antipodes, as compared with the results from apiculture elsewhere; notably in the United States. Occasionally, even in the inclement north, we hear of Scotch people who practise the humane non-swarming system—by which none of the industrious little workers are stifled—obtaining as much as seventy-nine pounds-weight of honey per annum from each hive. In the Ukraine (Polish Russia), it is a matter of common occurrence for the peasants to own five hundred hives apiece, and to boast occasionally that they make more money thereby than the farmers from their crops. At Mount Ida, in the island of Crete; Narbonne, in France; and Chamouni, in Switzerland, apiculture has long been carried on extensively, the value and fame of their honey being known all over Europe. But it is in America that this lucrative industry is to be seen in its fullest dimensions. It appears, from an article in the *Times* of January 14, 1879, that bee-keeping is conducted in the United States by means of large capital, many firms owning from two thousand three hundred to five thousand swarms of bees, and in the case of Messrs Thurber of New York, twelve thousand swarms. These apiculturists, indeed, in 1878 exported to Great Britain three hundred thousand pounds-weight of honey, being part of a product all over the States that year of thirty-five million pounds. The American mode of conducting the industry is this: Farmers and proprietors of orchards at intervals of three or four miles apart are arranged with, either at a fixed rent or for a share of the honey produced; and probably one hundred swarms are boarded with each agriculturist. Properly trained servants are sent round at regular intervals to clean the hives, remove saturated combs, and to destroy all parasitical or useless insects. In this way the farmer or gardener has very little responsibility; and the pecuniary result at the end of favourable seasons is highly satisfactory, as each suitable acre suffices for twenty-five swarms, and the insect boarders on four acres can be attended to by one man. The remunerative nature of the industry will be admitted when we mention that in America the seven years ending with 1879 exhibited an average harvest of ninety pounds-weight of honey per hive, which realised about tenpence per pound, or, exclusive of the value of the wax, a gross return of ninety-three pounds per acre.

A very curious phase of the industry is that portion of it which is conducted float. During

the early spring, a properly fitted steamer, with a certain number of swarms on board, starts, say, from New Orleans. Sailing slowly up the Mississippi, the vessel, with its humming freight, successively passes through Louisiana, Arkansas, Missouri, Tennessee, and Kentucky. By the time spring has developed into the glorious Indian summer, the gorgeous flower-decked prairies of Illinois, Iowa, and Wisconsin will have been reached and left behind. At Minnesota, the steamer probably remains for a time, or till the deepening autumnal tints warn the captain to commence his homeward voyage, when he slowly steams and drifts with the current back to the port of departure ere winter has set in. By this singular, yet eminently practical device, the bees are introduced to an ever-changing scene of floral wealth and beauty; their strength is husbanded, as their flights are necessarily short though frequent; the shining hour is improved to its utmost, honey being continually stored by the busy workers, and as constantly pillaged by the watchful crew; and the grand issue of the voyage is usually a return of two hundredweight of sweetness from every hive.

As already hinted, apiculture is yet undeveloped in New Zealand; nevertheless, the experiments which have already been made there have proved sufficient to satisfy inquirers how very profitable an industry it becomes in experienced hands, especially when the Ligurian bee is the one relied on.

Beet-growing for sugar-boiling has been tried, also with success, and as much as thirty tons per acre of first-class roots obtained; but the far more profitable sorgho-grass of Asia and Africa, although doubtless well adapted to the soil and climate, does not appear yet to have been attempted, at least on a commercial scale. This plant is extensively cultivated in the United States, thriving well as far north as Maine, where farmers not long ago stated that the profit from the sugar derived from one acre of maize—which yields one-fifth less saccharine matter than sorgho—was equal to the gain from the sale of thirty acres of wheat. Should a similar yield reward the farmer in New Zealand—and there is no reason why it should not be exceeded—our allusion to the industry as a subsidiary one will soon require modification.

Among the whole of our cultivated fruits, it is well known that none surpasses the orange as a remunerative crop, even taking into account the circumstance that nine or ten years must elapse between planting the seed and gathering the first harvest, where grafting is not resorted to. In several parts of New Zealand, both oranges and lemons already grow luxuriantly, the trees being usually planted about one hundred to the acre. At present, without the advantages conferred by scientific culture, we are informed that the annual reward to the owner from the fruiting trees is valued at the very moderate rate of seven farthings per dozen, showing a gross income of over ninety-six pounds per acre.

There is a difference of opinion about the desirability of cultivating olives and vines together upon the same estate; but happily there is none regarding the suitability of parts of New Zealand for the prosecution of both farming operations. On this point, an Italian authority

(Mr G. B. Federli, of the Survey Department, New Zealand) writes: 'The cultivation of the vine requires the identical kind of soil that is necessary for the olive, and the same treatment in planting; consequently, when they are cultivated together the labour is at least lessened one-third, and without the slightest disadvantage to either. One more important item is, that if the olive-trees fail for one year—as is the case sometimes in the countries where it is cultivated—the vines assist in lessening the loss, it being rarely the case that both fail.'

Space will not admit of our detailing several other important yet neglected plants for subsidiary culture, such as the male and female tallow-trees of China, one yielding a valuable white wax, and the other wax and varnish; the Japanese chestnut, the persimmon, cinchona, liquorice, medicinal rhubarb, dye-saffron, cork, dyer's madder, and many more, all fairly hardy, and no doubt well suited for the climate of Auckland. Those which have been particularised, should, it has been suggested, be reared under the wing of the more important tea and silk farming enterprise, with the double object of securing economy in working the whole estate, and with the view of attracting to the colony as wide and varied a circle of immigrants as possible.

With the leading points, and much of the detail comprehended in this and previous articles, the New Zealand authorities have, through their Agent-General, been already made acquainted; and as they have always been understood to be favourably disposed towards the promotion of new local industries, they have been asked if they will assist tea and silk farming in any degree; and if so, how. In order to help the government to form an opinion, the following suggestions have been offered.

For the Tea Industry.—(1) The necessary supply of one-year-old tea-plants and fresh seed from China, Ceylon, Assam, the Neilgherries, and Darjeeling, delivered at the nearest port to the proposed plantations at cost price, or free. (2) Facilities for the importation of labour from China, India, or elsewhere; and reasonable legal protection to the planter against the non-fulfilment or evasion of labourers' engagements. (3) A proportion of forest-land to the acreage purchased or rented, at a reduced figure, or free. (4) The admission without duty by the Customs of all material, implements, tools, and machinery necessary in tea cultivation, manufacture, and packing, for a short term of years. (5) Freedom from duty or excise impost for all tea grown and prepared within the colony for the first ten years.

For the Silk Industry.—(6) The necessary supply—four hundred plants per acre—of five-year-old white mulberry bushes grafted on black mulberry stocks, or other approved kinds and seed, from Sydney or elsewhere; also the needful quantities of any other silkworm-feeding shrubs, such as the castor-oil plant, the terminalia and jujube trees, the ailanthus, &c., delivered at the nearest port to the proposed plantations at cost price, or free. (7) Facilities in regard to labour, land, and freedom from duties, as in the tea industry. (8) And such encouragement as would lead to the speedy settlement of skilled reelers from France and Italy, silk throwsters from

England, and the purchase in time of all the elaborate mechanism required in the higher branches of the silk industry.

In thus indicating some of the directions in which support might be afforded, it was simply intended to prompt the executive upon a difficult subject; and it was explained that only for a limited period would aid of any sort be likely required. It was also hoped that an abstract of the probable industrial needs of the proposed enterprise, such as the above, might incline the New Zealand Parliament to come to some liberal understanding on the subject soon. Precedents are not wanting in other parts of the world, where state aid has been for lengthened periods extended to tea and silk farming. Surely, therefore, it cannot be too much to expect that the New Zealand government, once convinced of the feasibility of the project under review, will meet the proposal handsomely, and help to sow the seed of an enterprise which in the immediate future can scarcely fail to become a source of wealth to those islands, and prove an attractive refuge for at least a portion of the surplus female population of the old country.

The only other point to which it is desirable to advert is the fifth of the leading features—the expediency of adding the functions and responsibility of a Land Settlement Company. It has been represented to the New Zealand government that, in order to obtain the acme of success, it is believed that The New Zealand Tea and Silk Company (Limited) should be launched upon a scale of some magnitude; and that ample provision should be made, not only for extensions of the original area, but also for the expected influx of the numerous trades and professions which elsewhere invariably cluster around the centres of great industries. The authorities have accordingly been asked if, in the event of a Company being formed, and proposing to deal with an expanse of from twenty to thirty thousand acres, they would be disposed to grant the advantages secured to the Manchester Settlement, alluded to at page 215 of the Official Hand Book of New Zealand (1875). To this inquiry, the reply, as yet, has not been of that definite character which the actual existence of an established Company would doubtless have elicited. Caution on the part of responsible officials is admitted to be right and necessary; at the same time it should not be forgotten that no great commercial undertaking was ever consummated without the exercise of mutual confidence, even during preliminary negotiations, between the contracting parties.

In these days of bogus schemes, the public must be provided with well-digested facts, distinct offers, plain contracts, and perfectly reliable information, ere it will embark in undertakings, especially on the opposite curve of the globe. If the enterprise, set forth in this and previous articles, has recommended itself to the judgment of New Zealand colonists and statesmen, there need be no difficulty or hesitation on their part in indicating how and to what extent they are prepared to sympathise. On the other hand, taking into account the many millions of capital in this rich old country the owners of which are waiting with eagerness for safe and profitable investments, coupled with the universal desire to aid our large and ever-increasing army of well-born, well-edu-

cated, but impecunious females, we think that a bargain between the New Zealand government and the promoters of tea and silk farming in the colony need not be very difficult to arrange.

## CHAPTERS IN REAL LIFE.

### REAPING AS WE SOW.

WE are told that our sins find us out; and equally true it is, though perhaps not so evident, that acts of virtue and kindness do at times meet with their reward. There are few who cannot call to mind among our acquaintances, examples illustrative of both these truisms. The former abound in the world, and every day come sally within our experience. But the brighter side of the subject, of which an illustration or two are about to be given, is that which is most pleasant to dwell on.

A kinder-hearted and more genial person than Mrs Waddell it would have been hard to find. She possessed in an extraordinary degree the faculty of making every one happy with whom she came in contact. A thousand little kind and gracious ways, peculiar to herself, she had—small attentions, pleasant words, encouraging smiles, friendly sympathy. And these seemed to radiate from her like sunshine, diffusing a sense of comfort and well-being on all within her reach. A favourite theory of hers was, that if people would repeat to the parties commended the praises they hear of them—as they are prone too often to whisper the blame—how much the world would be the happier for it. 'Why not goodwill-makers as well as mischief-makers?' she would say; 'and why, when we hear a person or thing admired, do we hush it up from the very one to whom it would give most pleasure?' illustrating her meaning by the case of a young bride she chanced to meet once at a dinner-party.

The newly married lady was very young and painfully timid; and all in the company were strangers. As long as her husband was in the same room with her, even though she could not see him—far down the table—there was a feeling of protection and safety. But when the ladies rose to leave the dining-room, and the long line of matrons and dowagers filed out in formidable array, her heart sank, and she turned a yearning look of despair upon her only friend, as she was leaving him behind. The hostess, pitying the shy, trembling child-bride, carried her off to show her the flowers in an adjoining conservatory; and she had no sooner left the drawing-room, than remarks upon her appearance broke out among the guests. 'How pretty she is!'—'But so terribly shy.'—'So exquisitely dressed! Her gown fits as if—as the saying is—she had been melted and poured into it.'—'And *did* any one remark that lace? Old rose point, I should say, or perhaps point d'Alençon. I must get near, and have a good look. Enough to make one break the Tenth Commandment.'—'Such a quantity, too; she must have had grandmothers. I do adore old lace, and'—'Hush, hush! Here they come back;' and instantly the conversation was turned.

If the speakers had suddenly stepped on burning coal, they could not have started away from it more quickly than they did from the subject

under discussion. One guest became all at once interested in her neighbour's bouquet; another developed a violent anxiety about some one's cold. Anything for a change.

But now Mrs Waddell, true to her goodwill-making doctrine, came to the front. 'Do you know,' she said, with her kind winning smile to the young bride, who was timidly subsiding into a corner—'do you know we have all been talking of you while you were away! admiring your pretty dress and that superb old lace. You must let us examine it; and tell us all about it, will you not!'

The girl crimsoned with pleasure. 'I am so glad you like it. The lace was my mother's wedding-gift to me. It has been in her family for many generations, and she valued it most highly.'

And then followed more discourse, beginning with old lace for text; inasmuch that when the young husband appeared in the drawing-room, instead of finding his little wife abashed, as he expected, she was chatting away on the friendliest terms with those about her.

The charity that never faileth seemed to spring by nature—a spontaneous growth—in the kindly soil of Mrs Waddell's heart. A niece who resided with her, a fashionable young lady, given to exclusiveness and the proprieties, was oftentimes horrified at the shape it took. When, for instance, the lady would plunge into the roadway to pilot a blind beggar over a dangerous crossing; or would stop to pick up and console a miserable child fallen flat on its face in the mud while running a race, and left behind by its ragged companions, deaf to its utteries.

'Do, aunt, let the dirty little wretch alone! Here are all the Berkeleys driving up.'

But no. The incorrigible aunt would continue to fumble in her pocket for the penny which was to bring joy to the poor little heaving breast, and to evoke a smile, by blissful visions of sugar-stick, on the grimy face, down which tears and dirt were coursing.

Born 'in the purple,' and belonging to the upper ten thousand, Mrs Waddell's power of conferring benefits was confined to the exercise of the influence which station and personal popularity give. Her pecuniary means were but small, barely sufficing for the needs of her modest establishment; and it often cost her much contrivance and a hard strain to make ends meet. She was too sure of her position, as well as too essentially thoroughbred, to have recourse to the shams which make genteel poverty so terrible to those engaged in the weary struggle of keeping up appearances. But it was very unpleasant to be so poor. To be unable to do the same as others in her set—to forego any pleasures that cost money—to have to turn away from tempting 'bits' of Crown Derby and Capo di Monte—Mrs Waddell loved china as well as her neighbours—and above all, to be restricted in the alms-giving her generous soul would have delighted in.

One summer, when her exchequer was lower than usual, Mrs Waddell had decided to remain in town. Hotels and lodgings at the sea-side were expensive; and visits to country-houses entailing railway fares, vails to servants, and extra dress, were more than she could manage with prudence. So, having sent off her niece with a friend, she

remained behind to economise. The weather was exceptionally sultry for the time of year. The grass in the parks and squares was brown and burned up; fierce sunshine beat upon the hot pavements, and poured relentlessly down upon the heads of those whose business took them abroad in the day. In many shops, the employés behind the counter served in their shirt-sleeves. The lightest garments were adopted by all; every one languished in the sweltering heat. Attending church would have been a trial, had congregations been their usual size; but these were thinned by so many people being out of town.

It happened, however, that on a certain Sunday, the advent of a popular preacher had been announced in the chapel where Mrs Waddell had sittings; and in consequence, crowds flocked to hear him. The heat was intense, the crush and stuffiness almost unbearable. Every seat in the building occupied, every aisle crammed. Mrs Waddell, never very strong, was easily overcome by heat; so that the having her niece's place in addition to her own was a welcome relief, by giving her more breathing-room. Their sittings were the first two of the row; and during the service she became aware of an individual standing in the aisle immediately out-side her. He was a fat old man, dreadfully hot, and was perspiring profusely. Benevolent though she was, our good Samaritan could not make up her mind, as she ruefully scanned his dimensions, to offer her niece's place to this person. But she felt odiously selfish. It was a reproach to her, as the prayers went on, to see him leaning up against the side of the row, in, she fancied, a feeble, helpless way. The huge crimson bandana with which he mopped his pulpy face became in her eyes a signal of distress; and she imagined gont and suffering in his uneasy shiftings from one foot to another. At last, she could hold out no longer. Edging herself away as far as possible, she motioned to the man to come in; and with a grateful look he obeyed, sinking down—an obese perspiring mass of hot humanity—half suffocating the unhappy lady as he did so. Her discomfort was so intense, and the frowns of her neighbour on the other side so spiteful, at the accession of this extra heat and bulk, that a less kind-hearted person would have repented of her good deed.

But everything, disagreeable or otherwise, comes to an end and passes away at last. So did this sweltering Sunday service; so did the summer and its heat; and so did the memory of the elderly fat man and his crushing of her, from Mrs Waddell's mind. Summers and winters had arrived and departed; and now Christmas had come again. Christmas, with its often painful associations; telling, as anniversaries will, of change and variant places, and loved ones missed and absent. Christmas, with its greedy expectants, grumbling over gifts that at any other time, and not taken as 'matters of course,' would have filled the receivers with grateful pleasure; all craving, few satisfied. Christmas, that viewed, of course, in its secular aspect alone, brings—as some one has said—joy only to children and the young. Above all, Christmas with its bills! A distracting pile of these was on the breakfast-table before poor Mrs Waddell, when her niece came into the room.

'Enough to spoil any appetite,' she said, turning

them disconsolately over. 'Here is a letter that does not look like the rest. Not a bill, evidently. I don't know the handwriting;' and she broke the seal. 'Ah, a mistake; the letter's not for me. Some lucky person has been left a fortune,' she added with a sigh; 'and this is from the lawyer to announce it. I must send it back by return of post.'

But it was not a mistake, though Mrs Waddell maintained it must be, as she did not know the testator, and had never even heard of his name. It turned out that her little service to the old gentleman—a wealthy manufacturer, who had made his own fortune, and having neither kith nor kin, had meant to leave it to a hospital—had been thus rewarded. He had learned her name and address from the card affixed to the sittings; and subsequently identified her with it by inquiries made before leaving town.

Less direct, perhaps, than the foregoing is the instance to be recorded next. It occurred in the family of a widow lady with two daughters, living in the north of England. The elder of these was a beautiful girl; her sister painfully the reverse, and whose natural shy awkwardness was increased by the harshness of a vain and worldly mother, who, while lavishing praises and love upon the beauty, looked down upon her ill-favoured offspring, and showed that she was ashamed of her. The poor girl, sensitively alive to the deficiencies of which she was so often reminded, shrank from society, and remained neglected at home, while her handsome sister was taken about to wherever she could see and be seen.

To secure for the latter a brilliant establishment such as her charms deserved, was the object of the mother's ambition; and she had not far to look; for in the immediate neighbourhood was a *parti* eligible enough to satisfy the aspirations of any parent. Very carefully did she cultivate this splendid opportunity, making her house as agreeable as possible to the young man, and throwing him and her beautiful daughter constantly together.

Sir Hugh—as, to avoid particulars, we shall call him—on his side responded readily to her overtures. The noble mansion to which, by the death of an uncle, he had just succeeded, was depressing in its loneliness; and being of a sociable and domestic turn, he enjoyed the widow lady's pleasant home circle, and soon became a constant intimate. Her hopes rose high. Already she saw her lovely child fulfil a brilliant destiny—winner of wealth, worth, and high position; herself, thrice lucky mother-in-law! the envied of competing dowagers.

The time wore on; but still he made no sign. Almost filial in his attentions to the elder woman, and friendly in the extreme to all, no word of love had passed the young man's lips. It was unaccountable! and yet he seemed unable to keep away from the house, or to resist the attractions of its cheerful home-like charm.

Meanwhile, neighbours began to talk. The names of the pair were coupled together in the county, and there were some who smilingly inquired, when they might be permitted to congratulate. The widow was sorely puzzled. She dared not ask her guest his 'intentions,' fearing to put him off altogether; but it was impossible that

things could go on as they were. A winter in Rome had some time before been vaguely in contemplation; and now it occurred to our dowager that it might be advisable to carry out the plan.

'The prospect of our leaving home will bring him to the point, if anything can,' she thought; 'in any case, our doing so will put a stop to gossip.'

So she carried off her peerless treasure—no effort having been made to appropriate it—and went to the station, attended by Sir Hugh, who was as anxious and as useful, as full of care for her and her daughters, as thoughtful to save them trouble and see to their comforts, as if he had been the *fiancé* that he was not, and that, moreover, he showed no ambition to be. The end of disappointment was bitterly chewed during the journey to the Eternal City. It was then only friendship after all! How strange—how mortifying!

Great therefore in proportion was the mother's triumph when, after their return home, she found on her table Sir Hugh's card; and greater still when from him came a note asking for a private interview, as he wished to speak to her alone. So, then, the move had been successful—the game was won! Joy beamed in her face as she returned after the important interview, to the *salon* where she had left her girls, the youngest sitting as usual at work in her remote corner, the beauty on the sofa.

'Sir Hugh has declared himself at last—has asked me for my daughter. I knew he would,' she said; 'but I was not prepared for the splendid settlements he offers. His generosity exceeds anything I could have imagined. And now, darling, he wants to see you. Go to him, my child.'

'No, no, dear; wait. There's a mistake—a——; and the detaining hand of the younger sister was laid timidly on her elder sister's dress.

'What do you mean?' cried the widow to her. 'Do you presume to'—, and she turned fiercely on the poor girl, but stopped dead short on seeing her face. It was quivering with emotion; lips trembling, cheek and brow flushing painfully.

'I think,' she faltered, raising a frightened and deprecating look to her angry parent—'I—I think it is me that Sir Hugh wants!'

'You! Impossible!' Then, with a burst of wrath: 'And so this is what you have been doing—carrying on underhand! You deceitful!'

'No, mother, not deceitful. Until the other evening, when he waylaid me as I was returning from church, and asked me to be his wife, I never dreamed of such a thing; and I was afraid to tell you, thinking you would be annoyed—disappointed.'

And annoyed and disappointed she was, this unnatural mother; bitterly aggrieved that her handsome favourite, the pride of her heart, should have been set aside for one so looked down upon and unloved.

The marriage, when announced, was a surprise; a nine-days' wonder, canvassed over many an evening tea-table. In those days, the five o'clock institution had not been invented.

'The girl's an oddity,' said a gossip. 'Something queer about her—is there not?'

'Not in the least,' replied a friend of the family; 'but she's extremely plain, so has always been

snubbed at home and kept out of sight; but for goodness and gentleness she is, I hear, without an equal. Not a servant in the house but worships her; and none know us better than our servants. To the poor, she is an angel; and all agree that the good fortune which has befallen her is well and richly deserved.'

### OUR ROLLO.

#### A TRUE STORY.

A YEAR and a half ago, a friend gave me a little puppy, round as a ball, black as night, and with head and tail exactly like those of a fox, except that the tail curled up and swept round feather-wise. Indeed, a dog-breeder told me it was a thoroughbred Sioux fox. If an inordinate fancy for poultry, alive or dead, raw or cooked, is a sign of a Sioux fox, then certainly our animal was of the truest breed. The scrapes she has brought us into with our neighbours touching chickens and ducklings, are many. A bark, a cackle, a stampede of half-a-dozen children, and we are made aware that there is one more missing link in somebody's poultry-yard; and once more threats of slaughter are breathed out against our pet, mingled with a promise of 'a summons' for ourselves. A few weeks ago, Rollo became more staid, and her depredations were on a quieter, if not smaller, scale; for beyond a disinclination for plain food and a self-satisfied licking of the lips, around which feathers showed signs of her latest meal, there were no visible symptoms of bad habits.

One morning we heard our doggie crying, and when we went to see what ailed her, we found her moaning over three dead puppies. Her piteous efforts to lick them into life, her distress and sorrowful cries, touched our hearts; and it took the bravest amongst us to remove them from the poor mother and to bury them out of her sight. Now comes the strange part of my story. A little gray cat which belonged to us was, in all the pride of maternity, bringing up two kittens. We suppose that Rollo was determined to have something to love and care for, and that she was resolved not to be outdone by a paltry little gray cat. Anyhow, in the course of the morning there was a united cry of dismay from the children, and immediately eight little girls and boys ran in to tell me that 'Rol was killing a kitten.' I went to the dog's abode in the tool-house, and found her, with all the tenderness of the most loving of mothers, nursing the baby kitten. But I am sorry to say that success made the little foster mother greedy, and that, watching her opportunity, she marched off with kit number two, leaving poor Pussy babyless. The whole of that day—and in fact ever since—the amount of exchange and barter carried on between that cat and dog is a thing to be astounded at. The way those kittens travel, carried from place to place, now in the mouth of a dog, now in that of a cat, is enough to muddle the brains of any quadruped. Sometimes you will see the two kits in Pussy's basket, but far more frequently two in Rollo's. The doggie has lately adopted the plan of carrying one kit—the favourite or first-adopted one—in her mouth, sometimes head down, sometimes tail, when she takes a walk. Then, if we call 'Puss!' she drops

number one, and scampers off to the tool-house, to see if number two is all right. Oftener than not, Pussy—most likely watching in ambush—will seize the dropped kitten, and before Rollo's return, carry it off in triumph to her basket. We await the result; the head of the house not feeling quite happy, meanwhile, at having occasionally to get up in what should be the silent watches of the night, to march to the relief of a wailing kitten left on the garden door-step, while its adopted mother rushes off to indulge in a free fight with anything that comes in her way which, to her mind, is calculated to injure her baby.

The children are never tired of watching the morsels of kittens, which, I am free to confess, have the biggest heads and the straight-up-est tails I ever saw. They wait, with what patience children can, to see whether these kittens will, when they grow up, purr or bark!

### A LOVE-PROMISE.

#### A SUMMER EVENING SONG.

At that calm hour thou lov'st the best,  
When daylight softly closes,  
When birds fly, weary-winged, to rest,  
And Eve shuts up the roses—

At that dear hour of Nature's hush,  
When zephyr scarce is sighing,  
And lingering tints of roseate blush  
Are in the westward dying—

When heart to heart most vainly open;  
To loves the fondest clinging;  
When memories, and fears, and hopes,  
And orisons are springing—

I'll think how often, wending slow,  
That happy hour hath seen us;  
And breathe thy name in secret low,  
Though oceans roll between us.

Ah! yes; though Time's cold tide shall flow  
Absence and distance aiding,  
And try to chill what seems to glow  
Too warm, too bright, too feeling;

At that love-hour we oft have met;  
Still soft as daylight closes,  
Thou'lt steal on my remembrance yet,  
As dew upon the roses.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. To insure return in case of ineligibility, postage-stamps should accompany every manuscript.

3d. MANUSCRIPTS should bear the author's full Christian name, surname, and address, legibly written; and should be written on white (not blue) paper, and on one side of the leaf only.

4th. Poetical offerings should invariably be accompanied by a stamped and directed envelope.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

## OVERDONE.

ANY one who can throw his recollections back some sixty or seventy years, must, on considering the change of times, be struck with the manner in which criminals are now dealt with, in comparison with the way they were treated in his early days. It would be hazardous to say whether the change was, in all points of view, for the better. There is now far more leniency and humane consideration of circumstances than formerly, which, in the main, can only be spoken of with approval. But, on the other hand, the leniency is often carried to lengths so irrational and absurd as to be little better than a public scandal. The more remarkable peculiarity of the present day is the small amount of capital punishment, which at least indicates a certain improved tone of feeling. In old times, the gallows was in constant requisition, often for offences of a comparatively trivial character. Occasionally, at Newgate, a dozen or more poor wretches were hanged on a Monday morning. Every large town had an executioner as one of its salaried officers. Public executions were a favourite sight for vast crowds of spectators, among whom were boys, women, and children, who flocked to the sight as they would do to a performance of horsemanship. No boy would stay away from an execution if he could at all help it. We have the painful recollection of seeing a young man hanged for a highway robbery of four and sixpence, or some such small sum; and of seeing another youth, a post-office clerk, hanged for taking a five-pound note from a letter that was passing through his hands. People at large did not think there was anything wrong in these cruel severities. Magistrates looked very coolly on the proceedings. It was necessary to make an example. And there was all the moun that was made.

Besides frequent capital punishments, there was a good deal done in the way of banishment. Packing off shiploads of thieves and pickpockets to Botany Bay, as New South Wales was familiarly called, was a common fate of this class

of delinquents. Whipping at the cart's tail had gone out of fashion in the early years of the present century; but we have recollections of seeing men set in the pillory, in which prominent position they endured a bombardment of rotten eggs and ribaldry from the assembled populace, who gladly hailed this species of amusement. Altogether, the methods of punishing crime were of a rough and ready description, not involving much expense, as lengthened imprisonment would have been. Young lads captured for some petty offence, were abruptly sent on board a man-of-war, which was thought to be a good means of getting quit of them; for it rid the community of their presence, and at the same time helped to man the fleet. There were thousands of cases of punishment by magistrates of which no record was kept. We knew the chief magistrate of a town, who, being a grocer, adjudged criminal cases across the counter, while selling ounces of tea and half-pounds of sugar, and in an off-hand way sent people to prison for a few days or weeks without any note of the transaction. Keeping a record of sentences for the smaller order of offences, is a thing of comparatively recent date. Strangely enough, there was little complaint of these petty tyrannies. The press was still on a feeble footing, and subjected to oppressive taxation. Notions as to the liberty of the subject were howled out of countenance. Any one who did not fall in with the general opinion was deemed a revolutionist, and there was no more peace for him on earth.

At length, there was the dawn of a new era. It is due to history to say that the person who first proposed meliorations of the criminal law was Sir Samuel Romilly, who, from his position as a lawyer and a Member of Parliament, could not be well howled down, though his bills to abate severity were opposed as dangerous innovations; and not till after his death, which took place in 1818, were his views recognised as being founded on humanity and justice. In his opinion, death punishments were **OVERDONE**. They must be limited to the worst class of crimes. Since his time, as is well

known, there have been successive meliorations, in which respect matters have come to that extraordinary pass to be best described as a kind of vanishing point. We might indeed say that instead of severity in the administration of justice, it is leniency that is **OVERDONE**. If things go on as they are doing, there will be soon, apparently, no punishments at all, and the criminal classes will have everything their own way. It is under some such vague apprehension that we pen these remarks, in the hope—perhaps a vain hope—of recalling society to its senses.

Obviously, the meliorations referred to have been largely promoted by the social and other changes that have taken place within the last half-century. The manual labouring classes occupy an enviable position not enjoyed in any former period of the world's history. Wages have on all sides improved. Articles of daily consumption have been materially cheapened, not only by improved cultivation, but by free imports from abroad. Various odious monopolies are no more heard of. There is now much leisure time, which, we regret to say, is not always spent to advantage. If men are paid better for their work, they drink more. Admittedly, in a prodigious number of cases, a good example is set as regards clothing, house accommodation, the education of children, and the widespread taste for reading. The press no longer held down and taxed to the limit of endurance, has become a power in the state, besides being a prevalent solace. Several old and brutalising sports, such as cock-fighting, are thoroughly gone. Comforts in living, the cheapening of postage, and the easy means of personal transit from place to place, are beyond the dreams of the grandfathers of the present generation; so likewise is the freedom of popular debate, which had no example three-quarters of a century ago. Above all, the enormous sums deposited in Savings-banks, speak volumes for the general improvement in circumstances, and the widely extended habits of thrift.

Yet, when all is said in laudation of the present times, the saddening fact remains that great crimes, though frequent, are, in numerous instances, next thing to being unrepessed and unpunished. We need only allude to the stupendous frauds committed by the projection of certain joint-stock companies, and to crimes of violence arising from unregulated ebullitions of temper—the crimes of greed in the worst form, and the crimes of personal vengeance. There is our indictment.

In the meantime, we confine attention to crimes of brutal violence committed by workmen on their wives, or on women who happen to be within their power. Wife-killing has become the reproach of the latter part of the nineteenth century. There is nothing like it in the past. All the large towns in England and Scotland are less or more compromised in the foul reproach; the Metropolis of course coming in for the largest

share, but Glasgow not being very far behind. It is matter of notoriety that the parties chargeable with the atrocities are in most instances workmen, on whom all the improving influences of the age have seemingly been thrown away. We are startlingly made aware that there lurks in the depths of society a class of persons of a savage nature, who, on the slightest provocation, burst into acts of brutality comparable only to what might be expected from a wild beast. Religious considerations, and moral obligations, appear to be alike disregarded.

The modern criminal law as now administered proves unavailing as a restraint. On a late occasion, no fewer than seven cases of shameful brutality to wives were brought under the cognisance of the Metropolitan magistrates in a single day. Pulling by the hair of the head, throwing down and kicking to death with heavy boots, and stabbing with knives, were among the assaults committed. Some of the cases were dealt with summarily, others were remanded, and may come under the cognisance of the higher tribunals. It is, however, by no means certain that a sufficient punishment even in the more aggravated murderous cases will be inflicted. In every instance, there is an extraordinary uncertainty as to conviction, and what is equally observable, an extraordinary inequality in sentences. It is a toss-up whether a man who has killed his wife gets only six weeks' imprisonment, or at most a few years' penal servitude. There is no great chance of a capital punishment ensuing. What with the tenderness of juries, the discretion exercised by judges, and other causes, criminal trials have degenerated into a kind of lottery. It is not for us to go into details, or to apportion the degree of blame for what in ordinary phraseology is styled a miscarriage of justice. The matter may be left to the consideration of the bench, which in a general sense is allowed to be a model of purity and independence. All we can hint at is that there are defects somewhere. Unfortunately, the law itself has been so littered away as almost to lose its efficiency. Except to persons of sensitive feelings—and few of that class are subjects of criminal indictments—penal servitude for a few years in a well-organised prison has no special terrors. Something else in the form of smart bodily pain would need to be of more general application. Whipping, for instance, has, we believe, put an end to the crime of robbery by garroting. The lower order of ruffians who are addicted to manslaughter, while terrified for the whip, are apt to laugh at free quarters with good feeding in a well ventilated prison as a pleasant joke in the way of punishment. Be this as it may, the whole subject of penal repression needs to be reconsidered in the light of modern experience. The public are getting indignant at the loose manner in which the slayers of defenceless women are treated. The common remark is made, that this base class of criminals 'are not half punished.' We cannot but coincide

in the opinion. Leniency has been carried beyond all rational bounds. Philanthropy as concerns criminal jurisdiction is quite **OVERDONE**.

W. C.

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER XII.—CLEARED.

LATE as had been the hour when the capture was made in Mervyn's Yard, and later still as it was by the time that the reluctant prisoners had been marched as far as Portland Place—by devious ways, in accordance with the supplications of Mr Crawley, who shrunk from thus appearing before curious eyes in the frequented High Street—the windows of Mr Weston's house were still brightly lighted, and figures were to be seen moving to and fro behind the muslin curtains. The clang of the door-bell was quickly answered; and then came the tramp of heavy feet, and the unaccustomed clink of steel chains, in the hall; and above, the rustle and flutter of feminine dress, soft movements, the sound of soft voices, as female heads peered wonderingly over the banisters. The servants below-stairs were inquisitive too, but more guardedly, for servants lead but a suppressed life in our social system.

'Mr Weston is in his study, sir,' said the flurried man-servant, who dubbed himself a butler by right of wearing no livery. He, like the rest of the domestics, knew Bertram well. It had leaked and filtered to the underground regions that Bertram Oakley, that bright, frank young man—of whose prospects even the greasy and corpulent cook had augured well, saying often, that 'such as he might drive the world before them, scholars as they were'—had 'done something wrong.' There had not been very severe judgments passed, in the basement story of Mr Weston's house, on Bertram Oakley. 'Poor young fellow,' or 'It's a sad pity,' was what the housemaids said. And we think that their compassion must have related more to the fact that Bertram had been 'found out,' than to any blame which ought to have attached to the heinous offences attributed to him.

Into Mr Weston's study passed, first the Inspector of detectives, then Bertram. Mr Weston was not alone. Arthur Lynn, Mr Mervyn's nephew, was there. He was the first to speak, the first to regain his presence of mind. He went up to Bertram, with his hand out, and wrung Bertram's hand.—'Do me the justice to say that I never believed it,' he said, turning to the bewildered master of the house. 'I never thought Bertram here anything that I would not wish my own brother to be.—I came down, of course,' he explained to Bertram, 'in consequence of the telegram from our good friend Mr Weston to my uncle. But I knew from the first that the thing could not be, and that you at least would come stainless out of it.'

This kindness, this generous faith, were almost too much for Bertram. The young man turned away his face as the hot tears sprang to his eyes.

'Bless my soul!' exclaimed Mr Weston, whose perceptions were slower than those of his young guest, and whose train of thought required time, as it were, before it could be shunted on to another line. 'What is all this, Inspector?'

The detective, who, up to this moment had been

waiting mutely, like a grim ghost in uniform, that could not speak, according to the traditional practice of ghosts, until spoken to, now rubbed his hat with a red cotton handkerchief, and said curtly: 'Parsons, bring 'em in!'

Parsons and his comrade in blue complying promptly with this injunction, the respectable Mr Henry Crawley, with steel bracelets around his wrists, was pushed forward into the room; while behind him appeared, shambling and downcast, the gaunt length of the fellow in light-coloured slops, handcuffed too.

'Mr Crawley, why'—exclaimed the Manager, amazed at seeing the confidential clerk, the pattern of respectability, the supporter of subscription lists, the model of subordinates, in this guise.

But Crawley, after one wild glance around him, flung himself on his knees, not at Mr Weston's feet, but at those of Arthur Lynn, pleading, praying, for mercy. 'I have been a faithful servant,' he whimpered out. 'Spare me now. It is not the punishment I dread. It is the shame. I have an old mother still living in Berkshire. It will break her heart to hear of this. My sisters are well married. They respect me now. Do not—do not let!'

Every eye was turned, first on the detective, then on Bertram Oakley. The last-mentioned was the first to speak.

'When I found myself unduly suspected,' he said in a quiet tone, but in a voice that quivered, in spite of his resolution to be calm, 'I determined to clear myself, if possible. My good friend here the Inspector, and I, contrived a little counterplot, a stratagem of the simplest kind!'

'Not at all! Mr Oakley deserves the whole praise for the idea of it!' burst out Inspector Birch in a glow of disinterested enthusiasm. 'He it was, and no other, who got the notion that when the cat was away the mice would play, and that, if we kept watch on the Fittings Room, we might nab the real rogues at their work. It's seldom we of the Force get help, but rather hinderance, from the Public. But this is one of a thousand. We did watch—we did get hold of the collars of this brace of beauties—one chap showed us a clean pair of heels—but I'll have him yet—and there's a rod in pickle for old Isaac Bond of the marine store. But this one'—and the detective pointed to Crawley, still on his knees—'is the worst of the lot. It was mean, wasn't it, to try to ruin an innocent man, and to drop a card-case that belonged to him—here it is—it's yours, Mr Oakley—just before the policeman who was to pick it up, when the warehouse was first searched?—I'll tell you what, Squire Crawley, it didn't profit you much. I began to have my doubts, from that moment, there was foul-play somewhere—d'ye hear! snivelling as you are!'

'Get up, man, and speak in an attitude less fitting for a hound!' said Arthur Lynn scornfully to Crawley.

But the confidential clerk continued to grovel and to whine in a manner that justified the comparison—indeed, it was the hound that would have had the most reason to object to the simile. How unutterably hideous, miserable, and degraded, did this educated man look, as he humbled himself in the dust before the feet of those whom he had injured, craving for pardon! There was no

attempt at denial, there were no false pleas, no wily subterfuge. Taken red-handed, the wretch could but pray to be spared. For the time, his cunning brain lay fallow. He did but beg, as a trapped reptile gifted with human speech might have done, to be spared.

'This is a wretched spectacle,' said Arthur Lynn, turning away in disgust. 'The other fellow, by the force of contrast, cuts a better figure. Let us hear what he has to say for himself, if anything.'

The tall man in the slop-suit, thus appealed to, advanced a step, the handcuffs rattling on his wrists as he did so. He wore a cap, which was pulled down over his low forehead, so as to screen the restless, shifty eyes which abruptly glanced at every face in turn, and then looked to the floor. There was nothing very notable about the man, who was neither young nor old—a loose-built, lanky, shambling fellow, whose features were sharp, and his hair rusty, and whom a believer in the Hindu doctrine of the transmigration of souls might have set down as a hill-fox changed into manly shape. Such as he was, the prisoner came forward, made a duck with his head which was presumably a bow, then moistened his lips, and, after an inarticulate growl or two, said, deprecatingly: 'I'm a pore man, gen'lmen!'

The words were very few, and the sentiment the reverse of original, but somehow, Bertram found himself eyeing the speaker more attentively than he had previously done. Where had he heard that smooth, obsequious voice before?

'Poor, you may very likely be, my friend; but that does not excuse your being caught in our Fittings Room, or your conduct in bringing away with you what those bags contain,' said Mr Weston severely, as he pointed to the nearest sack, from the open mouth of which fragments of gleaming copper and objects in burnished brass had overflowed upon the floor.

Again the man moistened his lips. 'I was drove to it, gen'lmen,' he said, with a languid air, but smoothly as before—drove to it by poverty. I've tried—s'help me—to make a living on the square; but nobody won't have me; and so, meaning no harm, I got into bad company. That old Daddy Bond of the marine store says to me, says he: "Would you like to earn a few pounds? for if so, there's a job. A gent, he says, wants to get rid of a young chap that's been put over his head; and if so be you'll bear a hand to get some things out of the warehouse, of which he's got a false key, says he, and tuen kiss the book, afterwards, to its being this very young chap that put you up to the game, why?"—Here the man's fluent speech faltered, perhaps in doubt of the impression he was producing on the listeners.

'I understand—robbery, conspiracy, and false witness in reserve—these make up what you call the "game," my man?' demanded Arthur Lynn sternly.

Crawley in the meantime had risen from his knees, and stood with bowed head and shaking limbs.

'Well, Governor, it was a plant,' answered the tall man, apparently smothering a laugh, perhaps at the excellence of the plot, now frustrated. 'But surely a gent like him'—pointing to Crawley—'is deeper in it by a lot, than a pore man like me.'

At this moment, Bertram, who had approached Inspector Birch, whispered in his ear. The detective nodded assent, and whipped out in an instant a bulky black pocket-book and metallic pencil. 'Name?' he asked, in peremptory accents.

The question was twice repeated before the captive blurted out the word 'Gooch.'

'Address, Friars' Alley, hey?' said the policeman, writing.

The man nodded a sullen assent.

'Christian name?' inquired Inspector Birch.

'Christian name, Eldard,' muttered the prisoner; and then, as if he regretted the admission, turned his shoulder towards the company, and backed a pace in the direction of the hall.

'Come, you're no Southampton man, you know—not you,' said the Inspector, shaking at him a minatory forefinger. 'Where did you come from, Edward Gooch, and of what place are you?'

The restless, shifty eyes ranged about the room, surveying every face there, but one—Bertram's the eyes seemed to avoid. Then the man, again moistening his lips, replied fawningly to the question: 'I've been hovering about, seeking work. I've tried most towns, South coast, and couldn't get to stop. I've tried Portsmouth-way, Brighton-way, Dover-way, Ramsgate-way'—

'And never Chelsea-way?' asked Bertram suddenly.

The fellow started as if a wa-p had stung him, and became ashen pale, to his very lips. He threw a furtive glance at the doorway. No; escape was impossible. The two constables were at his back, and there were irons on his wrists. 'I don't understand you, Governor,' he said gaspingly.

'I think you do, Chelsea Ned,' replied Bertram, stepping forward. 'I knew your voice better than your face; and now I am certain to whom both belong. You got clear off, when your accomplices were punished for the piratical attack upon the clipper ship *Golden Gate*, at Blackwall; but now?'

'Now you are wanted,' chimed in the Inspector, rustling over the pages of his pocket-book in search of an entry. 'To be sure. Reward posted up at our station for the apprehension of Edward Blogg, alias Gooch, alias Turner. The description answers to you, my man, and it's a clear case.'

Sullen silence was the only reply.

Then there was a good deal of talking. Mr Weston had much to learn, which required explanation. Arthur Lynn was excited and eager. From above, and from below, came the stifled sounds of conversation, inquiry, and exclamation. Bertram and the detective, whose brains were quicker and clearer, asked no questions. Of the two prisoners, one kept doggedly silent, the other whimpered for mercy.

'You shall have the mercy you ask for, if you earn it,' said Arthur Lynn roughly, to the cur who craved it.

'I thank you, sir; I bless you. May heaven'—Crawley began.

'Keep your vile lips, Mr Crawley, from pronouncing sacred names and from uttering hypocritical appeals,' rejoined Mr Lynn, more harshly than he had spoken since his school-days. 'You are an old servant of the Firm, and were long thought a good one; and I am willing to believe

that the demon of Envy has prompted you to this atrocious act of yours. My uncle, I am sure, would spare you the exposure in the dock, the chains, the cropped hair, the hard prison discipline'—

I hope it may be so. The man is a good clerk. He has borne a respectable outside,' put in Mr Weston.

'I say "Yes" too, when it is a question of mercy,' said Bertram Oakley, seeing all eyes bent on him.

'Come, Mr Crawley, make a clean breast of it,' said Mr Mervyn's nephew. 'Your key to the warehouse door, which the Inspector here produces, and which was used for the robbery—how did you get it?'

'Killick the smith, in St Stephen's Lane, made me a duplicate,' answered Crawley meekly. 'The key, you had forgotten, sir, was in my care from the day Mr West left, till that on which Mr Oakley became Assistant Manager.'

'So far, so good, or so bad,' replied Arthur Lynn. 'Now why did you so hate Bertram here? That you were jealous of him, and wanted to have his place, I understand. But is that all? You know it is not.'

'Nat Lee was vexed, too, about the girl,' said Crawley hesitatingly.

'What girl?' demanded Mr Weston.

'Miss Rose Dehmann. That was Nat's affair, not mine,' answered the trembling wretch.

Arthur Lynn looked at Bertram's face, and saw his heightened colour at the mention of Rose's name; then at Crawley, and felt, as though he knew all. 'In Mr Mervyn's name,' he said, 'I would take it on myself to allow Mr Crawley to go free. Let him live his shame where he will, and take to better courses, if he can.'

But Inspector Birch intervened. Duty, the detective said, was duty, and Thomas must not turn blinded eyes toward's palpable guilt like this. No, no: both prisoners must appear, to-morrow, before the magistrates.—'But as for prosecuting, gentlemen, so far as *that's* concerned,' said the Inspector, jerking his thumb so as to indicate Crawley, 'the Law leaves you pretty much to your own choice. Chelsea Ned, here, is wanted for quite another business.'

So the Inspector marched away his brace of jail-birds, one sullen, the other weeping, to strong lodgings; and there was much hand-shaking and hearty congratulation among those who were left behind; and then Bertram, declining all offers of refreshment, went back to his lodgings; and Arthur Lynn remained Mr Weston's guest for the time being.

(To be continued.)

## COMETS.

THE comet which glided into the northern sky towards the end of June excited an amount of interest proportionate only to the suddenness of its appearance; a brief description, therefore, of its main features, and a comparison with previous bodies of the same kind, may prove interesting.

To the unassisted observer, the most noticeable peculiarities of this comet have been these: the suddenness of its appearance, and brightness when first seen; its course among the stars; the regularity with which it dwindled night by night;

the starlike brilliancy of its head, and fan-like tail. It will be convenient for us to take up these points in order.

The comet was observed on the 22d of June, but was clearly seen on the 23d, when it had a tail of some length, and a head 'brighter than any star in the sky;' that is to say, more brilliant than Vega, Arcturus, or Capella. These circumstances caused but little surprise to professed astronomers, for two reasons: comets have repeatedly appeared in like manner; and one of considerable magnitude had been observed in the south a fortnight before, and announced by Dr Gould as moving northwards. In respect to the first of these reasons, it may be remarked, that on the 3d of July 1819, a comet, large and of great brilliancy, and closely resembling the present in form and position, appeared immediately after sunset in the same unexpected way. With regard to the second reason, it may be well to consider here what were mentioned above as two of those peculiarities of the present comet which must have been apparent to all—its path among the stars, and the gradual waning of its brilliancy.

The comet was first seen a little below Capella, and from this point it rapidly climbed the sky towards the Pole. To those who, though acquainted with the fact that comets are members of the solar system, were still ignorant of the peculiar character of their motions, this must have appeared striking. But what holds good as law for the other bodies of the sun's system, is in every way inapplicable to comets.

If any one wishes to comprehend these matters, let him watch the moon during a lunation. When new, she is seen, immediately after sunset, just above the place where the sun has sunk; the next evening, she will still be in the west, but somewhat higher, to the left of her previous position. On each succeeding night, she will be found to have moved farther and farther away to the left hand, until at last she will be rising in the east while the sun is setting in the west. This is what astronomers call 'direct' motion; that is, motion in the order of the signs of the zodiac—which are counted eastwards from Aries, the Ram. Excepting the satellites of Uranus and many comets, the members of the solar system move in like manner, and travel close to the ecliptic—the zodiac, the sun's apparent path among the stars. On the contrary, the paths of many comets diverge widely from the line of the ecliptic; and of many, too, the motion is 'retrograde;' that is, opposed to the order of the signs. The 'signs' are enumerated in sequence in the following verse:

The Ram, the Bull, the Heavenly Twins,  
And next the Crab the Lion shines,  
The Virgin and the Scales;  
The Scorpion, Archer, and He-goat;  
The Man who holds the watering-pot;  
And the Fish with glittering tails.

We have already adverted to the fact that the comet of 1819 appeared in almost the same manner and place as the recent one; it would therefore, one might suppose, be open to us to identify them; but this astronomers know to be impossible. As comets obey the law of gravitation, it is essential that their path about the sun should be in the form of one of the curves called conic sections—

that is, a circle, ellipse, parabola, or hyperbola. As no comets move in circles, it is only when their orbits are elliptical that they can return. To ascertain, then, if a particular comet has been seen before, or if it is likely to return, it will be obvious that it is necessary to discover the kind of curve in which it is moving. To do so, three exact observations of its position are obtained, and treated mathematically (on the assumption that the orbit is parabolic), in order to ascertain what are termed the 'elements of the orbit.' These determined, the curve of the path can be deduced. These elements are, briefly, the exact moment of passage of perihelion, or in other words the point at which the comet approaches nearest to the sun; the position of the point of perihelion among the stars, as seen from the sun, and its exact distance from the sun; the degree to which the orbit is inclined, and the points at which it cuts the ecliptic; the extent to which the orbit varies from a circle; and whether the motion (as seen from the sun) is 'direct' or 'retrograde.' These things known, the orbit can be determined, at least approximately. An 'Ephemeris' is then computed; the places observed are compared with those predicted, and if they agree, it is inferred that the comet's orbit is parabolic; if they disagree—and if the difference increases daily—it is concluded to be elliptic. Inaccuracy or deficiency in the observations, and other things, often prevent the attainment of certainty in the result, so that there are sometimes many orbits computed for the same comet. So accurately can calculations be made, that a constant difference of two and a half hours between the predicted and actual times of perihelion passages of Encke's Comet occasioned one of the most important discussions in modern science.

We have stated that the comet of 1819 resembled the recent one in appearance. Such a resemblance, is, however, rare. Few things in nature present aspects more widely differing than comets. The nucleus of the comet of 1811 was a distinct and brilliant disk, which according to Sir William Herschel was four hundred and twenty-eight miles in diameter. This disk was severed from the sharply defined curve of light which formed the head, by a belt of utter darkness; the tail, also very vivid, was shaped like a scimitar, and in breadth about twelve times the apparent breadth of the sun. The head was red in colour. The comet of 1744 had six tails; that of 1665 had none, but was so round and so sharply defined as to be likened by Cassini to Jupiter; that of 1823—two-tailed—presented the almost unique feature of having one of its tails, the smaller, directed towards the sun.

Striking as are the differences between separate comets, the variations observed in individual comets are equally striking. The comet called Halley's, which at its appearance—in extraordinary brilliancy—in 1456 inspired such hatred, on account of its supposed connection with the Turks, as to be excommunicated by Pope Calixtus, appeared but small in 1531 and 1607; was in 1682, at one time, tailless; and in 1759 an object of considerable magnitude.

In the telescope, comets present some additional features; notably, the 'jets' and the 'envelopes.' The latter are concentric layers of matter thrown off from the head, which surround it on the side

towards the sun; they are separated from one another by dark spaces; taken all together, they form the 'coma.' They have, with more pith than poetry, been described as resembling the coats of an onion. They were seen to greatest perfection in Donati's comet of 1858. Coggia's, of 1874, had envelopes which were not concentric; and it would appear that the recent comet presented the same anomaly. The jets are what their name imports, ejections from the comet's head. Of some comets, more especially those of 1861 and 1835, they have formed the most striking peculiarity. That of 1835 (Halley's) was first seen on the 5th of August, as a round nebula, with a point of light situated a little to the side of its centre. It remained without tail till the 2d of October, on which day the nucleus suddenly became very bright, and threw out a jet towards the sun; afterwards, a tail was formed. This action within the nucleus then ceased, and was not renewed till the 8th, when it recommenced violently, and continued as long as the tail endured. On that day, the nucleus was like a burning coal, oblong in shape, and yellowish. The tail increased till the 15th, at which date it extended to twenty degrees. After this, it diminished. On the day of perihelion-passage the comet had, it seems, no tail, and was at no time in the interval brighter than one of the stars in the Plough; but the observations of Bessel and Struve record a series of changes in the jets and nucleus, unexampled for rapidity and complexity in the history of the heavenly bodies; in swiftness and character, they resembled those of the solar 'prominences.' Bessel says: 'The nucleus, with its emanations, presented the appearance of a burning rocket, the train of which was deflected sideways by a current of air.' The comet was lost sight of after perihelion-passage, till seen by Sir John Herschel at the Cape on the 24th January 1836, when its appearance was completely altered. It was now a round, brightly, well-defined body, within which—but not exactly in the centre—was a vivid nucleus resembling a miniature comet, with a head and tail of its own, quite distinct from, and much brighter than, the surrounding nebula. The next day it was larger, and the nucleus larger. Upon the 27th, it began to develop a fountain-like form, which remained, increasing in size, but to long in brightness, till the comet finally disappeared.

Although in exterior form the comet recently seen preserved a uniformity remarkable among bodies of the class to which it belongs, yet in the telescope it exhibited changes as peculiar as any of those mentioned above. Of these, we could not hope to give any detailed account in a manner very intelligible to our readers. One striking fact may be referred to: the transit of the nucleus over a star—an almost unique observation. The star did not appear to change its position, but seemed a broad disk of uniform brightness, instead of, as usual, a minute point with a clear concentric ring. A letter recording this interesting fact, and acutely commenting on its bearing on cometary theories, appeared in *Nature* for July 7th. In the same number was printed a communication from Mr. Common, in which, among other things, he stated that while, on the 24th of June, the nucleus appeared like a club, on the next night it was shaped like a star with five rays.

The light of comets is derived partly from

reflection of the sun's rays, and partly from matter solid or gaseous, rendered incandescent by the solar heat. This has become known by means of the spectroscope and polariscope. By the aid of the former instrument, it has been proved that certain comets consist of carbon or some compound of carbon.

We are, however, almost completely ignorant of the constitution of those uncertain celestial wanderers, and of the nature of the forces which, working within the nucleus, produce the jets, envelopes, and tail; and we are absolutely ignorant of their origin, use, and fate. Many theories have been propounded upon these points; but none is satisfactory. Shrouded in impenetrable mystery, these filmy forms float into the sky, pass, and disappear. 'They come like shadows, and they so depart.'

### A COMMERCIAL TRAVELLER'S TALE.

THE following amusing narrative is adapted from a story which appeared some years ago in the daily press.

A commercial traveller, on his business rounds, came to one of the large Yorkshire towns, where he found, upon his arrival, that the time which, under a lapse of memory, he had chosen for his visit, was most inopportune. 'The races were on;' and every house of accommodation was crowded to excess. Upon application to the landlady of the hotel where he had been in the habit of staying, he was informed that every bed in the premises had been booked for a week before his coming; and more than this, that even the very floors and tables of the dining-room would be burdened at night with racing-men and weary pleasure-seekers.

'We are extremely sorry, sir,' said Mrs Boniface, 'that we cannot receive you, an accustomed patron of the house; but under existing circumstances, it is impossible that we can. But,' she added, 'I will give you the names of some persons in the town who let rooms, and perhaps you will find among them some one who can put you up—at least I hope so.'

Our friend took the list of names with a rueful face, and at once set about the discovery of a place of rest for the night. But all his search was fruitless. Every bed and possible 'shake-down' in the whole district was pre-engaged; and if he would remain in the town, he must walk the streets until morning. But sooner than do this, he resolved to return to his good landlady of former days, and cast himself upon her benevolent contrivance and sympathy.

'Upon my word, sir,' she said, 'you greatly distress and puzzle me. I really do not know where in the world I can put you.' But after thinking for a moment, she asked: 'Will you consent to occupy the hostler's room, sir? It stands in a back part of the premises; and perhaps we could manage to make it—at least, in some degree—comfortable.'

The traveller thanked her warmly, and declared that the accommodation she spoke of was the very thing under the circumstances.

In about half an hour, the hostler was called, and told to take a lantern and conduct the gentleman to his bedroom. The way proved to be

across a large yard in the rear of the inn, up a step-ladder, along a narrow boarded passage, then up three stairs, and finally through a doorway into the sleeping apartment. Our traveller found, upon looking around, that good use had been made of the half-hour he had been kept waiting. A carpet had been put on the floor; blankets and sheets were unexceptionable.

'Good-night, sir,' said the hostler, setting down his lantern, to furnish some light. 'I hope you'll sleep well, sir; and indeed, I think you'll have a better chance of doing so here than the gents in the house—you're away from the noise; and in times like these, the streets all night are anything but quiet.'

It was late in the autumn of the year—the nights were long—and our friend, rather tired, soon fell asleep, and did not wake until the gray dawn of the morning, and not even then, had he not been aroused by some one coming along the outer passage with a heavy step, and entering his bedroom. Turning round in his blankets to learn who was the intruder, he perceived a man, tall, gaunt, and grim, his throat bare, the sleeves of his shirt turned up, and his hair all unkempt and standing upright in the most disordered manner. The dark figure drew near the traveller's bed, stooped over him, and peered down closely in the dim light, evidently anxious to find out if the person lying there was awake. Perceiving that this was the case, our traveller saw him, in the dusky light, draw himself upright in the room, then solemnly raise one arm, extend it, and point with his hand through the window to a place outside; after which, more impressively still, he slowly recovered the extended limb, and motioned with his forefinger three times across his throat. This done, the strange apparition abruptly departed, his feet sounding as distinctly upon the floor and step-ladder on his going out, as they had been heard to do when he came in.

The commercial traveller was not a nervous man, and he had knowledge, more or less, of the strange occurrences and rough usages of the world. Yet, this dark, grotesque, and absolutely silent intruder, and his most singular gestures, did not strike him as altogether pleasant or agreeable; and he would much rather not have been disturbed in such an unseasonable and unwarrantable manner. He would, however, take no action in the matter—at least for the present. Indeed, he felt himself powerless to do this in this lonely part of the premises. But he certainly, when he got up, would make complaint to Mrs Boniface of the way in which he had been annoyed. Fixing this purpose in his mind, our isolated lodger betook himself again to slumber, and had almost re-entered the land of dreams, when, both to his vexation and alarm, the footsteps he had previously heard, again sounded upon his ears—the same firm and measured tread—and soon his former visitor repeated his mysterious intrusion.

This time, the gaunt figure looked agitated and angry, and to our traveller's amazement and fear, carried in his right hand a large, long, and gleaming knife. Pointing his hand in a similar direction as before, he shook his grizzly head, and violently winked his eyes and stamped his foot; yet uttered never a word, but kept perfectly silent; and concluded his wild actions by drawing, not his finger, but the huge knife, determinately

and slowly, across his exposed throat. After this ghastly pantomime, a second time he took his leave, proceeding along the narrow, floored passage, and down the step-ladder to the inn-yard.

The man before whom this awful dumb-show had been performed, crouched and trembled in his bed. He had often heard of spectral and supernatural appearances, and had affected to laugh at those who declared they believed in them. But was not this, after all, an unearthly visitation? It looked extremely like 'it.' He would not, however, fully conclude that he had really seen an apparition; yet he would guard against a third invasion of this uncanny guest. He would do, what he now remembered he had unfortunately hitherto neglected—he would fasten the door of his room, and thus put a stop to any further ingress.

To his disappointment, however, when he came to secure his room door, he found that it was destitute of all fastenings. Feeling with his fingers, in the dim twilight, no lock, nor bolt, nor bar could he discover. Here was a desperate fix; and what plan for his safety could he now resort to? Thinking rapidly over the matter, nothing better, it seemed to him, remained to be done than to roll his bedstead head-foremost against the door, and thus effectually block up all means of entrance. Luckily, the bedstead was upon casters; it was therefore easily moved; so that our friend had no difficulty in carrying out his scheme; and returned once more to bed, somewhat more certain of immunity from intrusion. He could not, however, settle himself for further sleep; he had been too much disturbed and unnerved for additional repose, so he resolved to lie awake in his bed until broad daylight.

A quarter of an hour had but barely passed, when our traveller for the third time heard the same footsteps approaching his bedroom. He felt somewhat calm and indifferent, however; for had he not rendered his apartment completely impregnable? But short-lived was this feeling of confidence; for in a few minutes the steps had reached his door, and he heard hands moving over and pressing hard against it. Then a violent push was made, and after that, another and another, till the bedstead, on its too facile casters, was driven back into the middle of the floor. Again, his dread visitor approached him, and with tenfold added horrors; for his face and hands were smeared with blood, as was also the knife which, on his second coming, he had carried. Holding it as before in his right hand, he drew the crimson-stained weapon for the second time across his throat, repeating the action once, twice, and thrice; then again shook ominously his dishevelled locks; and turning upon his heel with a look of angry portent, left the apartment.

Our traveller was almost sick with terror; he shook in every limb, while the cold perspiration oozed from every pore of his body. He was an unbeliever in apparitions no longer. He could not stand out against positive proof, and here he had the clear and certain and repeated demonstration of his bodily senses. When he judged the spectre quite gone and the coast clear, he rose, and hastily dressed himself, rushing down the step-ladder, and into the inn, where he roused the whole inmates of the house with his cries that some dreadful tragedy had been committed on the

premises, and that every effort should be made to discover and arrest the murderer.

So much for the ghost; and now for the laying of it. It turned out, upon inquiry, that the gaunt and grotesque figure which had haunted our traveller was only a poor *dumb* lad, who was accustomed to help the hostler to kill pigs. On this morning, three of these animals had to meet the common doom of their kind. The first visit of the lad to our traveller's room was to inform his comrade—who, he knew, usually slept there—that the hour was come for their deadly work, intimating the manner of it by the three passes of his finger across his throat. Upon leaving the room, and finding, after due interval, that the hostler as he took our traveller to be—had not arisen for his task, he returned the second time, angry that his call had not been obeyed, and took the slaughtering knife with him, as a token and sign of what the lazy hostler had to get up and do. By the time of his third visit to the room, he had himself done the work of death without the aid of his fellow, and he brought the blood-stained knife to signify as much; and also in dumb-show to say: 'You may now lie in your bed there for another hour or two, if you like; but it has been too bad of you to leave all this troublesome piece of butcher's-work to me.'

We are sorry we cannot add that the traveller was quite pleased either with himself or with the explanation of his fright; for he felt that he had cut rather a sorry figure in the early morning; and he could not help observing that those whom he had aroused with his clamour and terror were slipping back to their rooms with much louder indications of merriment than our hero could properly appreciate. He took an early train out of the town, not even troubling his landlady to make breakfast for him.

#### SOME INSTANCES OF EXTRAORDINARY PHYSICAL STRENGTH.

Milo, the pride of ancient Crotona, who could carry an ox on his shoulders, and slay one with his fist, was an athlete of might; but there have been modern men of muscle capable of emulating the feats of Milo; and were trials of strength as popular and profitable as trials of speed, endurance and skill, we should probably not have to wait very long before seeing the best performance on record thrown into the shade by some muscular champion as yet unknown to fame.

Topham, popularly known as the Strong Man of Islington, although he failed to draw the bow of a Finsbury archer two-thirds of its length, justified the title bestowed upon him by rolling up a pewter dish with his fingers, bending a kitchen poker round the neck of an offending hostler, and pulling against a horse with his feet against a low wall. With his teeth he could lift a table six feet long, having a half-hundredweight attached to it; and coming upon a watchman fast asleep in his box, he took up box and man, and dropped them over the wall of a burial-ground.

In 1871, 'Monsieur Gregorie,' claiming to be seventy-one years old, mightily astonished the good folks of Hereford by carrying seven hundredweight with the greatest of ease, and by performing certain other extraordinary feats. Twenty years previously, he had performed Milo's feat

in a slaughter-house at Witley, in Worcestershire. It was, however, no new feat with him; he had done it again and again in his young days when travelling with an Italian circus. An English doctor who knew Gregorio intimately, describes him as looking like an exaggerated example of a muscular study by Fuseli or Haydon, having prodigious shoulders and a biceps almost incredible. For all that, he was one of the quietest of men, and simple as a child; living in constant dread lest he should be provoked into using his strength unprofessionally; and afraid to nurse his own baby lest he should give it a fatal squeeze.

Joseph Pospischilli was wont to amuse the Hungarian public by holding a table in the air by his hands and teeth, while a couple of gipsies danced upon it to a third's fiddling. He and one of his brothers would bear upon their shoulders a sort of wooden bridge, while a cart full of stone, drawn by two horses, was driven over it. Falling into evil ways, Joseph was imprisoned in the fortress of Olen, and one day volunteered to give the prison inspectors a specimen of his abilities; and permission being accorded, he so arranged the governor's heavy mahogany table as to hold it suspended with his teeth for nearly half a minute.

Jodigny, a French professional acrobat, lately performing at a Berlin theatre, executed the following extraordinary feat. As he swung head downwards from a trapeze, to which his ankles were fixed, a horse covered with gay trappings, and begirt with a broad leathern surcingle having two strong loops attached to it, and mounted by a full-grown man, was brought on the central stage, above which Jodigny hung suspended. Seizing the loops with his hands, the Frenchman, by sheer muscular strength, lifted horse and rider some inches off the stage; sustained their combined weight in the air for some seconds, and then let them down again as evenly and slowly as he had raised them.

Mr Stanley tells us that Simba, chief overseer of Amu bin Osman's caravan, standing six feet five inches barefooted, and measuring thirty-two inches from shoulder to shoulder, could toss an ordinary-sized man ten feet into the air, and catch him in his descent. He would take one of the large white Muscat donkeys by the ears, and with a sudden movement of his right foot, lay the surprised ass on its back; carry a three-year-old bullock on his back half-way round his master's plantation; and once actually bore twelve men on his back, shoulders, and chest, round Osman's house, to the intense wonder of a large crowd of applauding spectators.

Pete Pauquette, a slim-built but muscular-limbed half-breed, is still living to glory in his sobriquet of the Samson of Wisconsin. It was a favourite performance with him to take a handful of dry, hard hickory nuts, and crush them to pieces by merely closing his hand upon them. Senator Clark, who knew him well in his best days, said: 'His muscles were like iron. I have had him bare his arm to me, and I have taken a hammer and cracked hickory nuts upon the muscles; and it was like cracking them on a stone. One day,' relates the Senator, 'a party was proceeding by boat up the Fox, intending to go down the Wisconsin. When the portage came to be made, a yoke of oxen was procured to draw the boat across. It was very heavy; and before half

the distance had been made, one of the oxen gave out completely. Pauquette was along, and what do you suppose he did? Well, he took the end of the yoke vacated by the played-out ox, and pulled with the other one, and the novel team hauled the boat and traps across all right; and Pete did not seem to mind the strain half so much as the old ox did.'

Great commanders have not, as a rule, been notable for the possession of extraordinary physical powers. Washington was an exception, being a man of great strength. In his youth, he was once an onlooker at a wrestling contest, and growing weary of the sport, threw himself at the foot of a tree to enjoy his book. By-and-by, he was challenged to try a fall with the hero of the day. At first, he declined, until finding his refusal attributed to fear, he entered the arena, and without taking off his coat, grappled with his opponent, and, after a brief struggle, hurled him to the ground with such force, that the best wrestler in Virginia was in much the same predicament as the Duke's wrestler when he tried conclusions with Orlando. Later on in life, while watching some young fellows contending at throwing the bar, Washington asked to be allowed to try what he could do; and grasping the bar, sent it flying through the air, to land many feet beyond the limit attained by any of the competitors. And still later, when he might be said to be getting old, he showed that he had not lost his strength of arm. Taking a morning ride, he saw three of his workmen vainly endeavouring to raise a large stone. Jumping off his horse, Washington pushed the men aside, and without any apparent effort, lifted the stone to its proper place, and then remounting, rode on.

A man of great strength was William Joy, known in his day as 'the English Samson.' He was a native of Kent, having been born near Ramsgate in 1675. From an early period of his life he displayed remarkable strength and dexterity for his years; and when twenty-four years of age, he began publicly to exhibit his astonishing feats. Among other of Joy's performances, he is said to have been able to retain and keep in place a strong horse, urged by whip to escape his powerful rein, solely by the check of his pull, without any stay or support whatever. Aided by a strong leathern girdle or belt, and supporting himself by pressing his arms on a railing, he could lift from the ground a stone said to be a ton weight. He also broke asunder a rope fastened to a wall, which had previously borne more than a ton and a half weight without breaking. Notwithstanding his great strength, he was possessed of singularly agile and flexible joints, many wonderful stories being told of his feats in this respect, such as placing a glass of wine on the sole of his foot, which he could twist round with his hands, and conveying the glass in this way to his mouth without spilling.

But the rougher sex have not had a monopoly of such herculean qualities. In September 1818, there was shown at Bartholomew Fair, London, what was called in the advertisements 'the strongest woman in Europe, the celebrated French Female Hercules, Madame Gobert, who will lift with her teeth a table five feet long and three feet wide, with several persons seated upon it; also carry thirty-six weights, fifty-six pounds each,

equal to two thousand and sixteen pounds, and will disengage herself from them without any assistance.' She was also notified as able to bear an anvil of four hundred pounds-weight on her chest, while men forged on it with hammers; finishing up this branch of the performance by lifting the anvil with her hair, and 'suspending it in that position, to the astonishment of every beholder.' She was also to take up a chair by the hind stave with her teeth, and throw it over her head, ten feet from her body. One who went to see these performances, thought there was a good deal of trick in many of them. He describes the table she was to lift with her teeth as 'a slight rickety thing, made of deal, with a bar across the legs, which, upon her grasping it, is sustained against her thighs, and enables her more easily to swing it round several times, maintaining her hold only by her teeth.' The chair, he says, 'she makes nothing of, but canters it over her head like a plaything.' Upon the whole, this spectator was disappointed. 'That she is a strong woman,' he concludes, 'is evident; but that she can perform what is promised in her bills, is a notorious untruth.' Yet she is otherwise credited with possessing great strength; and it is told that on one occasion, on the road between Harwich and Leamington, when her caravan, 'which weighed two tons,' sunk in the mud nearly to the box of the wheels, the two horses being unable to extricate it, 'she descended, and with apparent ease, disengaged the caravan from its situation without any assistance whatever.' A contemporary writer describes this female Samson as 'short, but most beautifully and delicately formed, and of a most lovely countenance.'

William Hutton, the well-known Birmingham antiquary, met in with another 'strong woman' in the course of his wanderings in Derbyshire, and described her in the *Gentleman's Magazine* of the period. He saw her at Matlock in July 1801, and thus writes of her: 'The greatest wonder I saw was Miss Phoebe Bown, in person five feet six, about thirty, well-proportioned, round-faced, and ruddy. Her step (pardon the Irishism) is more manly than a man's, and can easily cover forty miles a day. She can lift one hundredweight with each hand, and carry fourteen score.' Her chief avocation was breaking-in horses at a guinea a week; and he adds that she always rode without a saddle, and was the best judge not only of horses, but of cattle as well, in the whole countryside.

In 1794, a man named Sheppard, a sergeant in the Coventry Volunteers, was noted for his strength. He was then about five or six and twenty years of age. An eye-witness mentions, that on being requested to show a proof of his strength, Sheppard desired to have a few oysters sent for, the largest that could be procured, unopened. These being produced—'and large ones they were—he took six, and devoured them, shells and all, in a manner we generally see a person munch a biscuit.' The same writer states that he lifted a heavy mahogany table with his teeth; and that he also took two men, of moderate size, one in each hand, raised them from the ground, and held them at arms' length. This man is said to have acknowledged that his superior strength lay in his jaw and neck; and 'he has been known to take a pewter pint pot, and tear it into pieces

and shreds with his teeth.' Sheppard, probably with a view to exciting the superstitious credulity of his neighbours, was in the habit of professing that 'he felt a visible decay of strength upon any time having his hair cut.'

### A FEW DROLLERIES.

A few years ago, a capital picture appeared in *Punch*, which was meant to represent not exactly the incident as there depicted, but the victim's sensations one moment later. A gentleman, naturally of a shy and nervous disposition in society, has been invited to a children's party. Like many quiet and retiring men, he is very fond of the youngsters, and is a great acquisition at their festivities, from his many ingenious resources for entertaining them. He generally contrived to come into a room in some novel and amusing manner, and it is in pursuit of this object that we see him in the picture. He has run up-stairs, and entered the drawing-room, unannounced, on all-fours. There he is, head down, coat-tails flying up over his shoulders, and revealing more waist-band and linen than are usually visible to the eye in that situation, prancing and scrambling round the room. But, unfortunately, his hospitable little friends live in a terrace where the houses are all alike, and he has gone to the wrong one by mistake. The children, who know him so well, all agog with expectation, are awaiting him *next door*. There happens to be an evening party at both houses, only this one is of the most severely 'grown-up' description. When he rises from his extraordinary gambols presently, this shy man will find himself in the midst of a roomful of strange ladies and gentlemen, whose surprise will certainly be more than equalled by his confusion.

It is even better than Leech's old drawing of the little stout gentleman who has undertaken for a wager to jump over a haycock. He accomplishes the feat, and is represented descending in mid-air, having just cleared the top gallantly. And it is at this exact moment—or rather fraction of a moment—that his observation grasps with lightning rapidity the fact that below him are a very loving couple, all unconscious of his advent, and picnicking sweetly together on a large veal-pie, into which he will drop like a meteor.

'Nothing would ever induce me to touch a reptile, of my own free-will: they disgust, they horrify me!' said a gentleman to his friend the doctor, with whom he occasionally dined, and who, while exhibiting his pet snakes and lizards, had been endeavouring to impress the fact that habit is everything, and that constant association with these creatures soon removes that loathing—quite distinct from fear—with which they are almost universally regarded.

'My dear fellow,' quoth the doctor, 'I will lay you a guinea that, within one month, you shall consent of your own free-will, not merely to touch, but even to taste a reptile!'

The challenge was at first resented as an absurdity, an insult to common-sense; but eventually the bet was accepted. There was much bantering on the subject for some days, and you may be sure the reptile-hater kept a sharp lookout, and carefully scrutinised any dish whose contents wore a 'froggy' aspect to his roused imagi-

nation, when eating in the doctor's company. The latter, however, knew the kind of man he had to deal with when he made the bet; and he attempted no practical jokes. The interest of the affair was beginning to die out, and it had ceased to be a theme of conversation between them, beyond an occasional passing reference, when one morning they met in the street, about three weeks after the wager was laid.

'You don't look well,' said the man of medicine—his professional compliment, with an eye to business. 'Liver out of order—eh? What did you do with yourself last night?'

'Oh, I'm all right!' was the ready response, in deprecation of the possible eight-ounce bottle and little circular pill-box looming in the foreground of the future. 'Never felt better; generally look pale in the morning.—Do last night? I dined at the Blanks' Hall; mentioning a noted Livery Company, celebrated for its princely civic dinners.

'Dined with the Blanks, did you? Then depend upon it, my boy, your liver is out of order. Now, let us see. What did you eat?'

'Well, nothing to upset me, that I know of. I took some soup, and a little bit of'—

'Stop, stop a moment! What soup?' asked the doctor.

'Turtle.'

'I thought so. Trouble you for one pound one for taster's reptiles; and I'll write you a prescription for your liver on the strength of it.'

It required a good deal of explanation and looking up of authorities before the friend 'saw it'; but he was convinced at last. 'Take the guinea,' he said ruefully; 'but keep your prescriptions for those who don't mind being poisoned!'

A good story is told in the States of an agent who travelled on commission for a firm of tombstone manufacturers. Expressions of monumental grief in iron, in marble, in wood, even in vulcanite and paper, had he; urns, cherubs, wreaths, columns, willows, angels, pillars—cenotaphs in every style, from the florid mausoleum which tearless regret might raise to the golden memory of a self-made millionaire, to the small flat cake, devoid of cross or ornament, destined to map out the ashes of a Quaker's child. Not that he carried 'stock' with him; but he had elaborate drawings and designs, with prices specified underneath, from which the customers could make their selection, according to their taste, means, or depth of woe. Orders were scarce, however; customers were few, and disinclined to launch out boldly in their speculations in this peculiar form of art. Americans are a practical people, and a gravestone can hardly be looked upon as a good investment for capital, from a business point of view. Times were beginning to get hard with the poor agent; so that when he one day overheard somebody talking of a farmer in an outlying district who had recently lost his wife, he pricked up his ears, and lost no time in repairing to the vicinity indicated. A long journey it was, and a rough one; and when he had accomplished the eleven miles which he believed would have brought him to his destination, it was only to be told that he had been misinformed, and that his quarry resided seven miles off, in another direction. So he tramped the balance of his journey, eighteen solid

miles in all, over broken ground, half-made roads, and ploughed fields. When he arrived at the farmhouse, he found that the farmer was at work on another part of the estate—one mile more; so he decided that he must not wait for him at the house, or he would fail to reach the nearest town before nightfall. At length he ran the bereaved husbandman to earth—literally to earth, for he was discovered in a most secluded spot, in company with several labourers, all very busy with their spades. To the 'boss,' our agent made advances with all the speed his weary limbs would allow, commencing to explain the nature of his errand, while unfolding his prospectus, by saying that he regretted to hear the farmer had lately lost his wife, and offering a few well-chosen words of condolence thereon. The object of his sympathy thanked him civilly enough, though not without a slight manifestation of surprise and annoyance. Yes; it was quite true, he said; he had lost his wife—in fact, she had bolted with another man some six weeks before! Here followed sundry hearty expressions on the part of the bereaved husband respecting his wishes for the future welfare of 'the pair of 'em,' which the commission agent did not wait to hear in detail.

A cobbler, an idle, dissolute fellow, who plied his trade in a certain village near which passes the main line of the Great Western Railway—then lately constructed—used to spend a great part of his leisure time—which meant that portion of the twenty-four hours not actively employed in eating, sleeping, or tipping—in sitting on a fence, watching for the trains. When one iron monster had gone thundering by, he was content to sit there, doing nothing, thinking nothing, and wait listlessly the two or three hours which elapsed before the next was due; for, as we have said, the railway was a novelty in these parts then. One day, as he lounged there, idly turning over a fourpenny-piece in his pocket, the thought occurred to him to place it on the rail, and see what effect would be produced by allowing a train to pass over it. A man is proverbially careless of his last coin, especially when his prospects of getting another are somewhat hazy, so, without any further reflection, this son of Crispin put the money on the shining rail. The clank and roar of a luggage-train were already audible in the distance, and he awaited the result with some curiosity. On came the engine, slowly labouring, and puffing heavily with the immense weight behind it. The wagons rattled past, and were gone. Could that be his fourpenny-bit? Why, it was expanded to the size of a sixpence, and looked so much like an old and well-worn specimen of that coin, that—Yes; he resolved to try it—quietly, of course, not to incur unpleasant consequences. Wending his way to the village alehouse, he called for a pot of that refreshing fluid, and tendered in payment the metamorphosed fourpence, which in its value at par, so to speak, would have been the exact equivalent for the beer. Nothing felonious about that, as far as external appearances went, certainly; though, when twopence change was received and accepted, a vista opened before his mind's eye. It was no longer a dream engendered by luggage-trains and thirst in fortuitous combination with a solitary fourpenny-bit, but a *fait accompli*. Fifty per cent. on all available capital

for life, easily realised without risk, without fail. Here was a discovery! He went out of the beer-shop, feeling already like a moneyed man!

We have spoken of the fourpenny-piece as a solitary coin, and so it was, as far as his pockets were concerned; but the reader is not to assume that it expressed the sum-total of his worldly wealth. Mrs Crispin, who was rather a shrew, always laid violent hands on her husband's cash when she got the chance, which was not often, and so managed to keep a small reserve fund for household expenses, and for the purchase of leather and implements for the working thereof, when necessary. This little store he now contrived to extort from her by vague and magnificent assurances of an immediate increase to be effected through some mysterious agency, the nature of which nothing would induce him to reveal. For three whole days he kept comparatively sober; and having pawned such items of the furniture as he could contrive to smuggle out of the house when his wife's back was turned, he found himself possessed of nearly five pounds in ready-money. It was a sore temptation to pass by the red-curtained bar of the public-house with such an amount almost throbbing in his pockets; but he resisted manfully; and walked to a neighbouring town to change the larger coins, little by little, for those small pieces, which now appeared to him to be the embodiment of all that was desirable in the coinage of the realm. At last, the exchanges were negotiated in full, and charged with fourpenny pieces to the extent of several pounds, he was ready for the grand experiment.

That it must be performed at night was plain, since it would never do to be seen engaged in such a task by any of his acquaintance. There would be no difficulty about this, however, as the down express flashed by forty minutes after midnight. At the witching hour, therefore, when all the village slumbered, Crispin stole off to the scene of action with his bag of silver and a lantern; and having carefully arranged the coins in two rows, half on one rail and half on the other, clambered up to his accustomed perch on the fence, and awaited the arrival of the train with a beating heart. A whisper in the air—a tremor of the earth—a rumble, a roar, a shriek—a delirium of fiery eyes, thunder, lightning, and earthquake—a whirlwind of steam and dust—two red lights disappearing in the distance.

He dashes up the bank with his lantern to secure his newly minted sixpences, but—*they were gone!* Not a vestige of one remained! Whether the greater speed had anything to do with it—whether there was any greasy composition on the tires—or whether the enormous friction produced by the long and rapid journey had heated them till they were adhesive in themselves, was never explained; but certain it is that every groat of the cobbler's fortune had gone to silverplate the wheels of a railway engine!

A friend of the writer's some time ago joined an amateur fire-brigade which had just been organised in the country-town where he resided. Amateur fire-brigades, like most other amateur undertakings, are fine things—for the amateurs themselves; splendid exercise, conspicuous uniform, innocent enjoyment in every way; for if they don't do much for the community at large, at

least they don't harm themselves. To 'keep cool,' is every amateur fireman's private and personal motto, which he carries out religiously; and a very nice motto too. Our friend B— was perhaps the exception which proves the rule, and in his infraction of it, constituted himself an awful warning. There could be no doubt about it that he and his brigade went in for playing at fires with downright good-will. They had helmets and axes, and a Captain and an engine; and such was the fervour of the enthusiasm which burned within them, that at times they could control themselves no longer, but would arise, don their helmets, and taking their engine, would spout water about the streets, run madly backwards and forwards with a long tube, mount ladders, shout, and save each other out of first-floor windows, without obvious cause or provocation thereto. Their frenzy used to reach an especial pitch outside girls' schools; and such prodigies of valour were performed under the stimulus of those bright and admiring eyes, that every man almost persuaded himself that he was smoke-begrimed. Then they would adjourn for beer, after these violent demonstrations, and become more heroic than ever. They were also possessed of a fire-escape, with which they had defaced most of the corner buildings in the town, owing to a distressing tendency which it had to lower itself unexpectedly from an upright to a horizontal position when in motion.

How they longed for a real conflagration! That their zeal would have culminated in arson before long, is far from improbable, had not the news arrived one evening post-haste that there was a house on fire in the next town, about a mile off. Their joy and excitement on the receipt of this intelligence knew no bounds. They rang their bell—they had *such a bell!*—they blew whistles, and threw on their uniform, yelling 'Fire!' all the time. But B—, who suffered from the mania more acutely than any of them, could not brook the delay of waiting while the engine was got under-weight, but mounting a horse, galloped off headlong to the scene of the disaster, axe, helmet, and all! Arrived there, he lost not a moment in procuring a ladder; and ascending amid the cheers of the assembled spectators, he cut away the framework of a window, entered a smoky room, rushed up-stairs, and brought down two children, who were passed safely down the ladder, frightened, but unhurt; while B— was greeted with thunders of applause by the crowd on his reappearance. He entertained the brigade that night at a champagne supper, at which they all sat down in their war-paint; and before going to bed, made some notes for a treatise *On the Best Means of Saving Life at Fires*, which he intended to publish immediately. And now comes the dénouement.

The next morning he received a bill of thirty-seven shillings and sixpence from the owner of the house, for damage done to the window-frame. It was nothing but a chimney afire, said this vulgar man; and if it had not been for his unnecessary interference, the children would not have been disturbed in their sleep at all. If he wanted to come in, there was nothing whatever to prevent him from knocking at the front door, and entering in the usual manner.—And he had to pay it! He has given up amateur firemanship entirely now,

and goes in exclusively for botany; and the odds are against his going up a ladder again to prevent a holocaust of children.

I—the writer of this—am the victim of a small ‘sell’ just now, which I have unwittingly inflicted on myself. Some one showed me a loaded cigar the other day—one of those foolish and dangerous things which explode like a squib in the smoker’s mouth—which I begged, and put in my pocket, intending to let it off the same night for the amusement of some children. But I forgot all about it; and finding the cigar a day or two afterwards, I laid it amongst a number of others before I remembered its nature. Now, I cannot distinguish it from the rest, and in consequence, am afraid to smoke one or offer any to a friend. Does any one want to buy half a box of real Havanas, cheap?

### THE MONTH.

#### SCIENCE AND ARTS.

IN the various International Exhibitions which have been held of late years, the interest of the masses has been centred in those productions of art which are beautiful to look upon, and which appeal to that taste for decoration which is common to us all. These Exhibitions have had a great effect in influencing that taste, and educating us in the arts of Form and Colour; so much so, that the design and furniture of a modern mansion are in their beautiful appearance very different from those with which our forefathers were content. But there has been gradually dawning upon us the conviction that many of these gilded nuts contain within them a rotten kernel in the shape of faulty drainage. The Sanitary Exhibition recently opened at South Kensington has done a good work in taking up this question, and showing us how manufacturers have endeavoured to stop those unpleasant and often fatal evils to which we allude. This Exhibition, although containing many things which can only be of interest to the medical mind, also possesses others which have a far wider bearing. New and ingenious forms of ventilators may be reckoned among these latter. What we may call sanitary decoration, forms another very pleasing feature of the show. This decoration consists in the employment of non-poisonous paints, which can be used in lieu of ordinary wall-paper, and can be washed with soap and flannel without detriment. No fewer than three firms exhibit a white pigment which does not contain lead, and they claim for the compound that it is more reliable, and better in every way than the poison it is designed to supersede. The constant occurrence among workmen of what is politely called ‘painter’s colic,’ but which in reality is lead-poisoning, should urge all employers of labour to give these new pigments a trial. White-lead has hitherto been the basis of all the colours commonly used; and if it can be banished in favour of a harmless material, so much the better for all.

The Printing Exhibition at Islington has also lately drawn many sightseers to northern London. Two exhibits are specially worthy of notice. One shows a system of binding books and pamphlets by means of iron wire; and the machines for stamping the wire staples into position are really wonderful to behold. The other exhibit which struck us as a novelty is the ‘Kidder’ self-feeding, delivering, and ruling printing-machine, which will turn out copies of circulars &c., at the rate of six thousand per hour from one ‘form.’ At the time we saw it, it was working without any attendant, and was throwing out circulars ready trimmed at the rate we have mentioned.

From the severity of the last winter in high latitudes, it is conjectured that the Atlantic will during the autumn be much obstructed by floating icebergs. The employment of dynamite torpedoes is suggested as a means for breaking up the ice, in the case of a ship becoming imprisoned in a floe.

The work of the farmer used to be considered the type of everything peaceful and quiet. The advent of the steam-plough, the reaping-machine, and many other contrivances which by no means bear the stamp of rustic simplicity, have done much to dispel the pleasant illusion. But we must look to other countries to find the latest curiosities in the art of farming. The rearing of ostriches, so successful in Africa, is now to be commenced in Mauritius; and in America, they are about to farm alligators. It seems that the demand for alligator leather is so great, that an indiscriminate slaughter has gone on, until in some districts the reptile is very scarce; hence the efforts to gather these strange lambs into a fold.

An instance of the persistence of life in some of its lower forms is seen in the discovery of some curious worms in a mine at Nevada. They are covered with a silicious shell, and were found three hundred feet below ground, and at a distance of seven hundred feet from the shaft of the mine.

It is sometimes necessary, for statistical and other purposes, to count the number of documents passing through the General Post-office. That this would, without any mechanical aid, be a most tedious work, must be conceded, when it is remembered what an enormous number of letters pass daily through our postal system. Two kinds of stamps have just been patented which automatically record each document upon which they have been pressed. The first kind has in its handle an ordinary registering apparatus, such as is attached to steam-engines to record the number of revolutions made by the fly-wheel. At the end of a day’s stamping, the handle would be unscrewed, so that the register might be read off. By the other plan, electricity is employed; the act of stamping causing an electrical contact, which operates upon a series of dials like those attached to gas meters. It is possible that these stamps, although intended solely for post-office use, may be found of advantage in different offices where large numbers of documents have to be dealt with.

We have more than once referred to the diving apparatus invented by Mr. Fleuss, which, dispensing with pipes and air-pumps, will enable a

submarine worker to penetrate to places which could not be explored by a diver equipped in the ordinary manner. Mr Fleuss has applied the same invention to an apparatus which will enable a man to go unharmed into any poisonous atmosphere, and to remain there for several hours. This apparatus is intended for the use of firemen, and also for miners in the exploration of foul workings. A proof of its efficiency has just been afforded by the reopening of the Maudlin seam at the Seaham Colliery, which has remained closed since the terrible accident which occurred some months ago. It is probable that this apparatus, which consists of a knapsack and a mask for the face, will in future be kept in readiness at all fiery mines.

Three doctors in New York have recently given their opinions relative to Sea-sickness. One dismisses the matter with the simple advice, 'Stay on shore.' The second doctor described the malady as being a nervous affection of the brain and spinal cord, due to a series of small concussions caused by the movement of the vessel. The remedy he proposed was bromide of sodium, taken before and during the voyage, under the circumspection of a physician. The third doctor recommends a few drops of chloroform on lump-sugar, together with the use of bromide of potassium. All three doctors agree in believing that sea-sickness—in spite of the popular belief—is productive of no good effect upon its victim.

A vast quantity of good food in the shape of eggs is annually wasted, simply because no remedy is adopted to preserve eggs from decomposition. The *Scientific American* has lately called attention to the subject, and also publishes some recipes by which eggs may be preserved fresh for many months. The first plan consists in placing a dozen or so at a time in a willow-basket, and immersing them for five seconds in boiling water to which has been added five pounds to the gallon of brown sugar. They are then placed on a tray to dry. The heat causes the formation of a hard skin of albumen next the inner side of the shell, and the sugar closes the pores. The eggs are then packed in a mixture of dry bran two parts, and powdered charcoal one part. Another plan is to dip the eggs in melted paraffin wax, afterwards packing them in bran and charcoal. In Germany, water-glass (silicate of soda) is largely used for closing the pores of egg-shells; and it is said with the greatest success. We might suggest to some of our country readers who have sometimes more eggs in stock than they know what to do with, that they might experiment in the above direction, with a view to determining a simple and cheap method of egg-preservation. They would thus do a work not only profitable to themselves, but one which would be of benefit to others.

Dr J. W. Mallet, of the University of Virginia, will, under the direction of the National Board of Health, commence an inquiry into the Relation of Disease to Impure Drinking-water. With this view, he invites all persons who suspect that any particular case of illness may be traced to the use of such water, to communicate with him. Should the case seem to promise valuable information, the water will be subjected to chemical analysis, and all costs will be borne by the Board of Health.

The manufacture of fire-bricks from flints has been commenced by the Thames Flint Fire-brick Company at Charlton, Kent. The process is as

follows: The flints are calcined in specially constructed furnaces, after which they are ground with lime-water into a plastic condition. The material is then ready for the moulds; but is found to be better if kept to ripen for some hours. The bricks made of this material consist of almost pure silica, and they will stand an enormous amount of heat. The manufacture is interesting, as being the sole industry of the kind carried on in the Metropolitan district, and in using up from the neighbourhood of its adoption a material which is very plentiful, and for which hitherto no special use had been found.

An engineer, in writing to some of the daily papers, describes what he considers the only sure and safe method of ventilating sewers. He suggests that six or eight inch pipes be laid along the streets, having openings at various intervals to the crown of the sewers. These pipes should be connected with pumps which would exhaust the foul gases from the sewers, which gases would afterwards be passed through a furnace, and thus rendered innocuous. Dwellers in towns are too often reminded, especially in hot weather, of the presence of these gases, which assail the nostrils from many a gutter. The plan suggested would be costly, but it would save many a life.

A new metallic alloy, under the name of Phosphor Lead Bronze, has been introduced by Messrs Kuehne & Co. of Lobtau, near Dresden. It is said to have great strength and hardness, and to remain cool under excessive friction. It has been tried on the continent by engineers, shipbuilders, and others, and is said to give the greatest satisfaction.

Professor Taylor, in the examination under the microscope of some cotton seed, with a view to study the oil-cells, has hit upon a discovery which may prove to be of vast importance. He was anxious to find the effect upon the seed, of different agents which are usually destructive to organic life. Among these agents was sulphuric acid. This had the effect of freeing the seed from adherent cotton. The seed treated was then sown; when, curious to relate, it came up five days earlier than it would have done in the natural state. This discovery is important in more than one way. The striped seed, freed from the cotton, can be sown by means of a drill; whereas, under the old conditions it was thrown broadcast on the ground. In the second place, an earlier crop can be secured, which, under general circumstances, is an obvious advantage. The experiment of treating other kinds of seed with the acid will doubtless be tried, and the result will be looked for by agriculturists with great interest. If the experiment prove successful, it will be a curious case of history repeating itself, as we know from the *Georgics* of Virgil that medicated seeds were in use among the ancients, and so recently as the seventeenth century, among farmers in the south of Scotland.

An instance of the way in which an injurious by-product can sometimes be turned to practical account, is afforded by the utilisation of waste hydrogen at the wire-works of Messrs Phelps at Trenton, New Jersey. It seems that at one stage of the work of wire-making, the metal rods are incrustated with a deposit of rough scale, which has to be removed by a bath of sulphuric and muriatic acid. The impure hydrogen escaping

from the acid vessels had a very marked influence upon the health of the workmen engaged. This gas is now collected, by covering the mouths of the vessels, and conveying the gas to a simple cleansing apparatus. It is then passed through a cheap hydro-carbon, which converts it into a gas of great illuminating power. Part of the gas is mixed with air, and conveyed to the furnace, so as to economise coal. Messrs Phelps's London agents are Messrs Clark, of 53 Chancery Lane, W.C.

Mr G. J. Symons, F.R.S., in a letter to the *Times*, points out the curious circumstance that the heat recorded in London on Friday, July 15, was greater by two and a half degrees than the hottest day experienced during the whole of the year 1860 near Gaboon, on the west coast of Africa, which is within a few miles of the equator. But it should be noticed that the heat in London is much more severely felt, because people will insist upon wearing that absurd badge of respectability, a black coat; whereas the natives of the Gaboon are quite free from anxiety as to what they shall put on.

By popular vote, the comet has been credited as the cause of the abnormally high temperature; indeed, there is a fast-rooted superstition among us to that effect. The celebrated French astronomer Arago once made an exhaustive inquiry into this alleged coincidence between comets and hot weather, with the result that, looking back to a series of years in which comets had been visible, he found they were as often accompanied by cold as by hot weather.

In the *Journal of Gas-Lighting* appears a very interesting Report by Major S. S. Jacob on the Jeypore Gas-works. It seems that the gas is principally obtained from castor-oil, and that the manager of the works combines with his other duties the occupation of growing his raw material. The castor-oil gives a gas of a very high illuminating power; but, produced in small quantities to meet a very inconstant demand, it is rather expensive, costing eight-and-sixpence per thousand feet. For houses situated at some distance from the works, the gas is supplied compressed into a wrought-iron receiver, which is attached to the gas-fittings when it reaches its destination. These works were established by the late Maharajah of Jeypore.

An interesting experiment was lately tried at Pittsburgh, Pennsylvania, by Mr D. T. Lawson, with a view to testing a certain theory as to the cause of boiler explosions; and for this purpose, a boiler of first-rate material and construction was erected. At the time of the experiment, the boiler was three parts full of water, and the dial indicated a pressure of about one half that which the metal was proved to sustain. When all was ready, a full head of steam was turned into the cylinder, with the result that the boiler and all its belongings were blown to fragments. It need hardly be said that the spectators and operators engaged in this curious experiment were safely ensconced in bomb-proof sheds. Mr Lawson claims that his hypothesis as to the cause of explosions is by this experiment proved to be correct. He argues that the only dangerous element contained within a boiler is superheated water. On a sudden reduction of pressure, such as that which must occur when steam is suddenly let off to the cylinder,

a certain quantity of this water is instantaneously converted into steam, taking up seventy-five hundred times the space occupied by the water. This sudden expansion operates in precisely the same manner as fired gunpowder; and the boiler, however strong, is bound to give way. Mr Lawson suggests the construction of a boiler having a central partition to separate the water from the steam. This partition would be furnished with valves, somewhat smaller in the aggregate than the port for admittance of steam to the cylinder, and in this way the release of pressure would be gradual. A boiler built on this principle is shortly to be submitted to the same test as that which burst the one already experimented upon.

The Reserve Squadron lately dropped into the sea a machine known as Vanderberg's Sea Messenger. This contrivance is meant to answer the purpose of the bottle which, time out of mind, has been used for the purpose of preserving papers giving notice of shipwreck. The Sea Messenger consists of an iron box in three water-tight compartments. The middle one has a screw lid for the reception of documents, the two others merely serving as air receptacles to keep the thing afloat. It is crowned with a little flag, which is kept upright by the weight of a keel below. It will be curious to learn who picks up this Messenger, and where!

M. F. de Romilly has invented a new form of air-pump, of a very ingenious construction. It consists of a cylinder, which by a side-opening is attached to the receiver, to be exhausted of air. Projecting into the cylinder at its top and bottom are two pipes, with their openings opposite to one another. Through one of these pipes, water is forced at a considerable velocity, and is received into the slightly enlarged mouth of the other pipe. In its passage, it draws the air from the cylinder, and the receiver is gradually exhausted.

An invention interesting to builders, which has already been largely adopted in America, has just been introduced into England by the Anglo-American Roofing Company, Leadenhall Street, London. The invention simply consists in the use of specially shaped and prepared metallic sheets, in lieu of the common slates used for roofing purposes. The slates are made of iron; and the patent includes many methods for securing them against corrosion. One method is to use a metallic paint, and to dip the metal plates into it while hot; by which a better contact between paint and iron is secured than by the use of a brush. Another method consists in coating the iron with a metallic alloy; this is known as the Calamine Process, and is said to protect iron better than ordinary galvanising. The slates are by another method coated with a glass enamel, which is much more durable than ordinary enamel, and will not chip.

Whenever any kind of crime is committed in a railway carriage—and happily such offences are few and far between—there goes up a cry for the adoption of saloon carriages, like those in use on the American railways. We fancy that the majority of British travellers would not like the innovation. To begin with, they like a certain amount of privacy whilst travelling; and secondly, in our variable climate, a small snug travelling compartment becomes almost a necessity. It may also be taken for granted that a man on crime

intent will, if foiled in his purpose on a journey, sooner or later endeavour to accomplish his ends out of doors or in an ordinary dwelling-house; and we must all admit that plenty of crimes are perpetrated between four walls, yet no one suggests that our rooms should all open into the street.

Some years ago, Ex-Governor Stanford of California conceived the idea of obtaining the photograph of a horse in motion, for the purpose of determining the precise movements of the animal's limbs. After various experiments, a photographer succeeded in discovering a method by which this might be done, it being possible to get an accurate impression of the movements of a horse passing the camera, although the exposure of the photographic plate was estimated not to exceed one five-thousandth part of a minute. Every movement in the stride of a horse while running at full speed has been ascertained through the agency of this instantaneous process, with absolute accuracy. In order to demonstrate their correctness, views of the different movements are placed in a rotating instrument (called a zoogyroscope), similar to the amusing scientific toy known as the zoetrope; and when it is turned rapidly by a hand-crank, the various photographs, as seen through the slits in the revolving disk, look like perfect images in continuous natural motion, showing the various gaits of galloping, cantering, trotting, and walking. The invention has not only upset the theories of artists and others concerning the position of the limbs of moving animals, but has led to some important changes in the methods of horse-training.

An interesting discovery of relics of a bygone age has just been made in Oxford Street, London, during the demolition of some old houses there. The find consists of armour and weapons and some church utensils supposed to be of the fourteenth century.

#### 'WHITE WATER.'

In connection with this curious phenomenon, an account of which appeared in our issue of June 11, another correspondent writes as follows:

I am not sure that the explanation of the 'white-water' phenomenon given by your correspondent, is the correct one. The phenomenon is most rare, and is difficult to account for. In Kingsley's *Letter from the Tropics*, which appeared in *Good Words* for March 1870, it is thus referred to: 'As the steamer stopped last night to "pack" her engines, and slipped along under sail at some three knots an hour, we made out clearly that the large diffused patches of phosphorescence were Medusæ, slowly opening and shutting, and rolling over and over now and then, giving out their light, as they rolled, seemingly from the thin limb alone, and not from the crown of their bell. And as we watched, a fellow-passenger told how, between Ceylon and Singapore, he had once witnessed that most rare and unexplained phenomenon of "milky sea," on which Dr Collingwood writes in his charming book, *A Naturalist's Rambles in the China Seas*. Our friend described the appearance as that of a sea of shining snow rather than of milk, heaving gently beneath a starlit but moonless sky. A bucket

of water when taken up, was filled with the same half-luminous whiteness, which stuck to its sides when the water was drained off. The captain of the Indiaman was well enough aware of the rarity of the sight, to call all the passengers on deck to see what they would never see again; and on asking our captain, he assured us that he had not only never seen, but never heard of the appearance in the West Indies.'

Though of rare occurrence even in the tropics, this phenomenon was observed on the coast of Northumberland in 1878. In the early part of the summer of that year, the fishermen from Shields observed this unusual appearance in the water, which they called the 'white sea.' It was first met with by the steamers leaving the Danish coast for the Tyne, and continued till off Shields, and northwards to the Coquet I land. The fishermen in setting their herring-nets in this 'white sea' found but few herrings. The nets were coloured as if dipped in a bath of lime. That year, the sea was unusually warm, the sea-thermometers registering the high temperature of fifty-eight to sixty-one degrees. This formation was supposed to be produced by an immense collection of floating crustaceans produced by the high sea-temperature. In 1816, a similar 'white sea' was observed between Berwick and St Abb's Head. In both years the herring-fishing was a failure.

[There being thus various *kinds* of 'white water,' it is evident that there must be more *causes* than one to account for the phenomenon. It is therefore reasonable enough to suppose that our former correspondent's theory of 'reflected light,' or a sea mirage, is one of the possible causes. *Ed.*]

#### BY THE SEA.

FIERCE on the white cliffs blows the August fan;  
The fishing-vessels anchored in the bay  
Scarce heave upon the water. The ripe ears  
Of golden corn nod in the warm west breeze,  
Dreamful of Harvest; while a gentle haze  
Wraps land and sea in its soft silvery folds,  
And throws a tender glory o'er the scene!

Smooth as a mirror, calm as Childhood's sleep,  
The sea lies shimmering, a sheet of blue,  
In the bright golden sunlight. Here and there,  
In shadowy scumblance, white and russet tails  
Fleck the horizon.

On the yellow sand,  
The murmuring wavelets beat, what time their crests  
In tiny ripples break. With merry shout,  
The fair-haired darlings of our hearts and homes  
Their mimic castles build—a fruitless toil,  
Since the advancing swift-destroying tide  
Sweeps all before it.

Emblem of the schemes  
Which we—but children of a later day—  
Plan for ourselves, to find the fabric frail  
As are those fragile castles of the sand!

## UNIVERSITY ETIQUETTE.

THERE used to be a favourite tale extant in my college days, which I think will be unknown to many people, though possibly it may have been taken in the first place, like many such tales, from some printed source. It was something like this. The occupant of a boat, while attempting a too ambitious feat, was upset, and not being a swimmer, was in considerable danger. A townsman on the bank regarding his struggles, at last appealed in great excitement to an undergraduate near him, whose flannel dress seemed to point him out as no novice on the water, and who was also watching the issue in evident hesitation. 'For heaven's sake, sir, if you can swim, give him a hand,' he cried; 'he's only a few yards from the bank.' 'Oh, I can swim well enough,' was the slowly uttered reply; 'but you see, the fellow has never been introduced to me.'

I suppose that etiquette is generally the product of age and custom. Where could it have a better right to flourish than among the gray old quads, and oak-lined halls of Oxford and Cambridge? And as the above tale shows, it does flourish there, and has been in some respects raised to the position of a fetish. Undergraduates, more especially in their earlier days, when, suddenly released from the many restrictions of home and school, they welcome other ties, fall under the bondage of this new code, which hitherto has been unknown to them—the code of etiquette. Yet, as a matter of fact, a great many friendships arise from common pursuits, intellectual or athletic. The captain of a boat soon gets to know freshmen; and men rowing in the same boat become warm friends and companions, without the intervention of etiquette. Yet, in their own phrase, undergraduates are ever trying to be, and do, and seem 'the thing.' Of course, their code is not so extensive as that of the outer world, since many events which head the chapters of this latter, do not fall under its cognisance. Let me here guard my readers against supposing that I am about to write a treatise that may suffice for the guid-

ance of the undergraduate. My ambition rises to nothing of the kind. I would merely note a few points, some perhaps now obsolete, which I think may interest those whose sex or circumstances have not made them intimate with such usages.

The first thought of most youths entering college is probably, 'Who will call upon me? Whom shall I know? Shall I have many friends?' Hitherto, his friends have been hardly a matter of his own choice; they have been either those of his family, or schoolfellows to whom necessity has bound him. Now, he will begin his social life on his own account; and many at this point, just before making the plunge, feel a good deal of diffidence, and have a chilling dread of social failure, and the untried solitude which may await them. Behold the freshman established in his rooms, proudly scanning his household gods. He is ready to put the matter to the test, and soon learns in the most cheery manner that it will be his own fault if he do not enjoy a life which combines, as no after-life does, the pleasures of society and solitude. His rooms are his castle; but beyond his 'oak' lies a merry world, open to him from early chapel to the smallest hours. Various rules control the ceremony of first calling. It rests of course with the seniors—in residence, not age—to take the initiative; and unless they call, no steps towards acquaintance with them can be taken by the new-comers. These latter, however, among themselves may shake up without so much formality; and an invitation given at dinner or at lecture 'to come and look at my rooms,' will probably be cordially accepted and returned.

As to the overtures of the senior, different colleges have different rules. In the smaller ones, I believe all the oldsters call upon all the freshmen, and so everybody in these smaller colleges knows everybody else therein. But in huge colleges like Trinity at Cambridge, or Christ Church at Oxford even, this rule would be inconvenient, and in practice impossible. So at these places it is at the option of the oldsters upon which of the freshmen, if upon any, they will call. And it may

be said that sometimes there is a more or less strong feeling against promiscuous calling upon freshmen; it is held that some previous acquaintance, or family connection, or at least a common friend, should afford a pretext for such overtures. Thus, perhaps, young fellows of rank or wealth are saved from undesired advances from which they could only free themselves by some degree of rudeness. In Trinity, Cambridge, a senior man only calls on a freshman if he has some acquaintance with or knowledge of him—for example, if he comes from the same school. But if a freshman has rooms in college, the senior men on the same staircase call on him, as a rule. An invitation to breakfast, luncheon, or dinner frequently follows the call; and the senior men whom the freshman meets at such a meal often call on him afterwards.

Now for a curious and, in my opinion, very reasonable point of etiquette, which appears when these calls are returned. Our freshman when so doing must not leave a card, should his senior be out, as the latter may have done. No; he must call again and again until a meeting be obtained, and on each unsuccessful occasion he must leave no sign. I do not know whether it is rigidly carried out still, but it seems to have reason on its side, which cannot be said of all rules of this kind. I mean that in this way a genuine acquaintance is insured, and there is no fear of men who have exchanged calls being still personal strangers. Many profitable friendships are thus formed, which, under the ordinary rule, would have failed on the first threshold.

As to introductions: as a rule, they formerly only held good for the immediate occasion; now, however, if A and B get on well together on their first introduction at C's hospitable board of an evening, they are sure to nod and say good-morning to each other at the least, when they again meet. Some men never introduce their guests to one another, but allow them to 'shake together' in the course of the evening. It used to be customary at Cambridge, for a graduate only, to prefix 'Mr' to his name on visiting cards, and woe to the luckless freshman who, rejoicing in a new card-case, and ignorant of *'the thing'*, distributed his cognomen thus dignified. I wonder if this rule is still strictly adhered to! When calling on a man, you knock at his door and walk straight in. There are no bells, and the scout has something else to do when waiting on half-a-dozen masters; but the visitor will find in almost all cases the name painted up over the door, or on a plate at the foot of the staircase, to which the porter at the college lodge will direct him.

In regard to dress, the rules at different colleges are very various. Often there occurs a collision between the unwritten laws of custom and the statutes of the University, which may well perplex a freshman. At Cambridge, it is etiquette for all below the standing of M.A. not to carry an umbrella when in cap and gown, even in the rainiest weather. A walking-stick is never carried nor are gloves worn with the academical costume. It is the rule for undergraduates to take off their

cap or hat to their *tutor*, but to no one else amongst the Dons. The Oxford University statutes forbid undergraduates to appear after dark without cap and gown on pain of a fine of five shillings. But an old custom at Christ Church, more or less generally followed, forbids the wearing of academicals outside the gates save at lectures, or the like. The consequence is some small addition to the University chest, which the Housemen, as they proudly style themselves, cheerfully subscribe when detected, regarding the unlucky event as their kismet, and somewhat in the light of a praiseworthy sacrifice. And the Proctors, who are fully aware of this prejudice, levy the fine and ask no questions.

In Oxford, academicals are seldom worn—save at lectures, &c.—in the daytime; and I think I may say never outside the city. At Cambridge, a University regulation orders cap and gown to be worn every day after dark, and all day on Sunday. But, as a matter of fact, very few undergraduates would think of wearing them when out for a country walk on a Sunday. At Oxford, the academical costume is generally regarded in the same light as a military officer's uniform is by its wearer—to be thrown aside at every possible opportunity. Perhaps the ungraceful scantiness of the undergraduate's gown, which is simply a big pocket-handkerchief, black of course, with armholes and a couple of tapes attached, may have something to do with this feeling.

At Christ Church, all the men when attending Sunday chapel wear surplices; but in order to be distinguished from the choir—such at least is the reason I heard assigned for it—they do not button them, but wear them open in front; and so worn, they are very graceful garments. One of the odd sights of Oxford is Peckwater Quad, on a Sunday morning in the summer-term, immediately after chapel. It is then thickly studded with a hundred white-robed undergraduates, disporting themselves with their hands in their pockets, chattering and flitting to and fro like so many overgrown white rooks. Not a graceful simile, I am afraid, but a natural one. At Cambridge, every college has a different kind of gown for its undergraduates; in all cases, a more ample and dignified robe than the Oxford undergraduate's gown.

At Cambridge, what seems rather an incongruous costume is or was usual with certain Masters of Arts who were not Dons—that is, not part of the ruling body of a college, but were still in residence. With their gowns, they wear, not a 'mortar-board,' as do other men, but a chimney-pot hat. The effect strikes one as very odd at first, but it is quite an affair of use. It is the custom to shake hands with acquaintances and friends only when you meet them at the beginning of term; after that, until the beginning of next term, no sign of greeting, save perhaps a nod, is exchanged. Occasionally, when meeting some one whom you have known in the outer world, habit gets the better of one. I remember once talking to a home friend about home matters. As we parted, I grasped his hand in momentary forgetfulness, and hurried away without a backward glance, blushing at my want of observance. It was not thought below one in my time to give one's scout a hearty shake of the hand after the vacation, and I hope it is still not unknown.

To put that aside. Something of Arab hospi-

talities and equality still remains among the Jews of learning, as is seen in some odd ways. Every man may be addressed without prefix, if he may be addressed at all. A prejudice against the intervention of sugar-tongs, and a preference for a common wassail-bowl, lingers yet. To the visitor is assigned the best-padded and deepest chair; and is accepted by him as a right. Long may it be so. But what about the friendships that, fostered and guarded by such courtesies, arise from this kind of life? Is there anything of Arab fidelity about them? Be sure there is; and many an example of it could I show around me at this moment. Such friendships linger on long after separation and new ties seem to have killed them. Many a gray-haired veteran shares his port, or toast-and-water, with some of those who with him pulled an oar or drained a pot, tooled a team to Abingdon, or walked a grind to the Gog-Magoggs who were as so many Jonathans in the days 'when we were boys together.'

## THE FORTUNES OF BERTRAM OAKLEY.

BY JOHN B. HARWOOD.

### CHAPTER XLII.—THE OLD STORY.

Two days after the nocturnal adventure in Mervyn's Yard, Bertram, who had rambled forth beyond the boundaries of the town, and by almost unconscious habit, had traversed the well-known Avenue that forms its stateliest approach, found himself emerging upon the Common beyond. He had been walking slowly, deep in thought, how meditating on the craftily-laid snare he had so narrowly escaped, now weaving day-dreams for the future, when, as he passed the end of a deep and winding lane, where hollies and hawthorns grew thickly, and the banks were steep and high, he heard the sound of a female voice in accents of distress, and mixed with broken sobs. It seemed to Bertram that he knew the voice.

'Rose!' he exclaimed. 'Impossible!' Nevertheless, he hurried into the lane, and in a moment came in sight of Rose Denham, agitated and in tears, vainly endeavouring to pass by a man, whose back was turned towards Bertram as he came, but who stood in the middle of the road and barred the way. The man was dressed in a rough suit of sailor's blue, like a merchant seaman ashore; but Bertram fancied that he recognised his active, well-knit figure, and long dark hair, though his face was averted.

'Do not persecute me thus. I say, No—a thousand times, No! It is useless to'—sobbed out Rose, in supplicating accents. At that moment, the sound of Bertram's hasty tread reached the man's quick ears. He let go the girl's wrist, which he had held, as if to prevent her from passing by, and turned his face—the face which Bertram had expected to see—that of Nat Lee.

A dark scowl came over the adventurer's reckless visage as he saw and recognised Bertram; and, as he recoiled, his right hand slipped, as if by instinct, into an inner pocket of his rough monkey-jacket. Bertram, without hesitation, dashed forward to

secure him; but Nat Lee, with a sudden change of purpose, darted back, scrambled up the steep bank, which he scaled with the catlike agility of a sailor, and crashing through the tangled hedge that crested it, leaped into the meadow beyond. Bertram's first impulse was to pursue, although he had little doubt, from the significant gesture he had noticed, that the desperado was armed; but as he, too, was in the act of forcing his way through the hedge, he turned his head for a moment, and saw that Rose had sunk down fainting on the bank; and, abandoning his first intention, he sprang down, and made haste to raise her.

'Rose—dear Rose!' he said, as he lifted the girl in his strong arms. 'You are safe; you have nothing to fear now. Your persecutor is gone, and you are safe—safe!'

It was the first time that he had called her by her name without the ceremonious prefix of 'Miss,' which etiquette usually exacts when there is no tie of consanguinity or of love avowed. But men, as the sea-saying goes, do not pick their words in a gale of wind; and certainly Bertram's gave no offence to the slender, golden-haired girl. His arm supported her; her fair head leant upon his shoulder.

Presently, a faint tinge of colour came back into the girl's blanched cheek. 'It was not for myself—not for myself so much,' she said, trembling; 'but when I saw you follow'—And she shuddered.

Never had the sound of a human voice rung so sweetly in Bertram's ears. She cared for him, then! His fate was not indifferent to her. It was not the mere weakness of her sex, confronted by danger, but that other and even more womanly feeling which had made her shrink and shudder at the notion of another's peril.

'He is gone now,' said Bertram gently. 'In another place, another country, I trust he may become a better man. He will beset your path no more, believe me, dear Miss Rose. In Southampton, he cannot venture again to show himself. It augurs rare audacity in the man,' added Bertram, 'that he should have lingered on even in disguise, so near us all, a hunted fugitive as he is. But what did he dare to say?' demanded the young man, with heightening colour.

'It was the old story,' faltered out Rose. 'He urged, he insisted that I must marry him. He was my Fate, my Destiny, he said; and he added that evil to myself and to my sister, a long heart-sorrow, would be my reward, if I persisted in denial. He was fierce and rough, and swore that he would not have the best scheme of his life thwarted and blighted by the caprice of a silly girl. Nor would he let me pass, but drew out a pistol, and declared that he would sooner shoot me dead, and himself next, than be balked of the fortune that he said lay in my gift. Then I—I was so frightened—and'—

'Hush! my darling; the wretch only strove to terrify you into submission to his demand of

marriage,' said Bertram soothingly. 'But now he is gone, and I am here, and will see you safely home. Nor do I think that even the villain Lee spoke seriously—though my blood boils when I remember his insolent persecution of the only being I have ever loved. He is bad enough; but not capable of executing a wild threat such as that. But Rose, indeed I cannot keep silence longer. Tell me darling, if I talk of love—love for you of all women I have ever known, would you think me presumptuous, or?'—

'No—no! You are too kind—too good,' sobbed the girl, turning away her face, which flushed scarlet now.

'It is presumption,' exclaimed Bertram eagerly. 'Do you remember, Rose, the poor boy I was, when first your generous father brought me from St John's Hospital in Blackston to the shelter of his roof, a mere mill-hand, a waif of the beach, reared on the bounty of ragged, tender-hearted fisher-folk? Were not you and your sister Louisa as sisters to me—the friendless, homeless lad—from the first? Then came, just as I thought the sun shone out, clouds and gloom for us all. But I hope—I do hope that the clouds have broken now, and the sun shines again! What a home might I have made, glorious and happy by your love, my darling, if I could bring you to it as my wife!'

A shy glance, and then a word—the word, was all the answer to this impassioned appeal—an answer more effectual than volumes of direct assurance.

On the homeward road, Bertram assured Rose, again and again, that she had no cause to apprehend further annoyance from Nat Lee. Already, on account of the robbery in Mervyn's Yard, the man had been hunted for, high and low, among the Southampton hotels where it was his custom to sojourn. He had escaped arrest; but now the police of the town would be aided by the constabulary of the adjoining counties, and the adventurer would find, to use the words of Inspector Birch, 'the place too hot to hold him.' Of his vague menaces, Bertram made light. His irritation was probably due to the fact that he had some scheme in his head, for the execution of which it was necessary that he should marry one of Dr Denham's daughters. Now, no doubt, he would turn his wily brains to other objects.

Then Bertram told his fair companion of his own brightening prospects. His first patented invention was, according to Arthur Lynn's enthusiastic account, working wonders. It was described in scientific journals as capable of effecting a revolution, or, at anyrate, a saving of some thirty per cent. in steam-power for marine engines. Fresh evidence of the success poured in, in the shape of guardedly worded offers, per post, to buy the inventor's rights, for a moderate sum in cash, or for glittering royalties in the future. Meanwhile, another device had been sent up to the Patent Office; and a third was nearly perfected. Bertram's frugal habits enabled him to save half his salary. Mr Lynn, in his uncle's name, spoke of promotion yet in store.

'There is but one more subject—now that I am

happy, happier than I ever dreamed to be, in the prize I have won, in your love, dear Rose,' Bertram went on to say—'one more subject on which I feel restless and anxious, and that is the fate of my lost parents. That they were not drowned, when the emigrant ship was cast away, is with me an article of faith. But where are they now? In America, most probably, perhaps with other children around them, of course in a new home, but still, I suspect, poor. The United States are not an El Dorado for all. I wish I could find them.'

'Yes, Bertram,' whispered Rose, creeping a little closer to his side, as they walked along. In her loving eyes, the young lover was the very type of all that was noble and good and true. Had he not, in the very dawn of his nascent prosperity, sought her out—little Rose Denham; and was it not natural that he should be eager to track the subsequent fortunes of the parents to whom he owed so little?

'I am sure,' pursued Bertram, 'that I should be fond of my father, somehow, and that he would understand me. That box of tools—I have it still, treasured up, as when the Coastguard Lieutenant let me have it from among the collection of articles washed ashore from the shipwreck—how often have I handled the contents! They belonged, I should say, to no ordinary village mechanic, but to one who did fine, dainty work, such as ornamental wood-carving, or the like. The old Bible, too, which contains the entries of the marriage and of my birth, is such as may be found, I am told, in ancient granges and the farmhouses of substantial yeomen. Yet they must have been poor, to have taken a passage for America on board that rickety, ill-fated craft. Next month, I hope, through Messrs Mervyn's introduction, to set inquiries on foot in the States. It would never do that the son should be thriving here, and the parents poor and far away!'

There was no lack of sympathy in the reception, by Mr and Mrs Denham, of their pretty governess and of her rescuer, when the villa had been reached, and the requisite explanations given. The worthy couple were honestly indignant with Nat Lee, and honestly sorry for Rose. Had the Hue and Cry—once the terror of marauders, in a very different England from that which we see to-day, the England of moor and morass, of packhorses and bridle-tracks, of darksome forests, and red-deer ranging free—not been obsolete, Mr Theodore Denham would certainly have headed it on this occasion for the chase and capture of the runaway. As it was, he contented himself with a pledge to write urgently to the Chief Constables of Wilts and Hants, and an outspoken wish, as he glanced at where, above the book-shelves, his forensic wig slumbered in its japanned tin box, that 'the rascal were indicted at the Old Bailey, and I were for the Crown!'—in which case, it may be feared that the offender would not have had his sins brought home to him so very closely, after all. But the good master and mistress of Shirley Villa were more in their element when they congratulated Bertram on his recent escape, which was town-talk now, from the machinations of Crawley and his colleagues, and on the very high esteem in which he was held by his employers. And then it was time to say good-bye; and, in the porch, as Rose gave

Bertram her hand shyly, he bent his head and again touched her soft cheek with his lips, murmuring a lover's adieu.

### A FEW HINTS REGARDING THE FOOT.

DEFORMITY is an ugly idea; emphatically so in connection with youth and general beauty. Violent exertion, constrained posture or weakness, may distort the spine or the limbs, or destroy the symmetry of the shoulders; hard work may cramp and deface the fingers; but the functions of the foot are so simple and so independent, that if it be left to do its work in its own way, it is not easily deformed, except by perverse treatment, and especially by being 'cribbled, cabined, and confined' in stiff unyielding fetters of leather, imposed upon it by Ignorance, or the tyrant Fashion and her devoted ally Vanity. Their despotism has decreed that our unfortunate toes shall suffer pain and actual deformity, as well as the loss of the beauty and vigour with which Nature has endowed them.

As the foot needs only freedom and exercise to become well shaped and vigorous, and as our climate and customs compel us to clothe it, we have to determine how these somewhat conflicting requirements may be fulfilled; how we may supply it with comfortable and becoming protection, so as not to hinder, if we do not help it in its work. It especially behoves those who have the care of the young to know something of its structure and functions; for it is during the growth of the foot that boots and shoes do most of their irremediable mischief. The soft, elastic, pliable foot of a baby naturally undergoes a succession of changes during its progress to maturity; and even when quite free—as among barefoot nations—must exchange some of its flexibility for the firmness and muscular power it needs, to become the body's porter.

Whoever is familiar with Indians, Arabs, or others whose feet have never been fettered in shoes, will admit that they move with an ease and 'grace beyond the reach of art.' The efforts of the drill or dancing master can hardly remedy what early mismanagement has induced. The African traveller Burekhardt, who so thoroughly mastered the languages and adopted the habits of the countries he explored as to pass for a native, was detected to be a European only by his feet; nothing could hide their contrast to those of the sandalled sons of the Desert.

Who is brave enough to tread with due firmness upon a painfully cramped foot? The suffering member turns in or out in search of ease, the knee bends inwards, a shoulder is raised, and one or both arms are thrown out to balance the ill-poised body: the whole figure sympathises with the shrinking timidity of the step; and even the face betrays the misery inflicted by a misfitting shoe. Thus too often do we mutilate the foot and derange its machinery, instead of enjoying the beauty and fitness which its normal state exhibits. But the last lesson man learns is to appreciate perfection. What a foot should be, and may be, is shown us in sculpture, if nowhere else. The Hercules, the Laocöon, the Apollo, show it as adapted to the strong and energetic action of a man; the Venus de Medici has the perfect foot of

woman supporting the body's weight; the Dancing Nymph its form in the act of springing; while its graceful *abandon*, as suspended in absolute rest, is exquisitely presented in Una reclining upon the lion.

The human foot contains twenty-six bones. The seven forming the heel and back are massive, and so shaped and arranged as to make the arch of the instep. In front of the instep are five more symmetrical bones, lying parallel to each other; the forepart of them resting on the ground, each forming the 'ball' of the toe to which it is joined. The highest bone of the instep, the keybone of the arch, is called the astragalus; the heelbone is the largest of all. The instep combines in exquisite perfection the resistance of the arch with as much elasticity as enables it to bear safely the prodigious strain to which it is subjected in leaping, carrying heavy weights, &c. There are fourteen bones in the toes; two only in the great toe, and three in each of the others. As these are in rows like soldiers, they are called phalanges. The middle five are called metatarsal; and the seven making the back of the foot are the tarsal bones.

This framework is kept in position and made capable of its proper range of movement, by means of muscles and tendons; the latter being strong fibrous bands, their fibres at one end interwoven with those of the muscles, and at the other attached to the bone. The tendon fixed to the heelbone is pulled up or relaxed by three muscles in the calf of the leg. The power of these muscles may be conceived from the fact, that by mere contraction they raise the heel, and with it the whole weight of the body. The tendon they act upon, which is at the back of the heel, is called the *tendo Achillis*, because Thetis is said to have held her infant son Achilles by the heel while she plunged him in the river Styx, to render him invulnerable. His dip accomplished this, except in that part which, being covered with her hand, the water did not touch; and accordingly it was there he received his death-wound. The two smaller muscles surround the ankle like ropes on pulleys, one being attached to the bone which lies in front of the keybone—called the scaphoid—the other is fixed to the fifth toe. Acting in antagonism with these are two other muscles, which keep the ankle steady, and turn the foot in any direction we choose.

As we sustain a feeble limb by bandages, so does Nature sheathe the bones with tendons and muscles. But Nature's bandage is living and sensitive, increasing or relaxing its pull or pressure in the most exact obedience to our will, whose mandates it receives through the mysterious agency of the nerves, which have been aptly termed the telegraphs of the brain. In a sound, free foot, each part of the machinery is in constant readiness to bring it into the required position, whether to lift up the body, to bound, or to sustain the shock of its whole weight in coming down again; to bear it upon alternate feet, as in running or walking; or to carry it through all the complications of agility and grace shown in 'the mazy dance,' 'the pretty of motion,' so perfectly is it fitted for its functions.

The weight of the body falls upon the astragalus, from which it is distributed over the other eleven bones which constitute the arch of the instep; the

heelbone and the balls of the toes being its pillars. As the single bone at the back of the foot is placed almost perpendicularly to the keybone, the shock caused by the descent of the body's weight upon the heel is far more severe than when this weight descends upon the forepart of the foot, where, as there are many bones jointed together by elastic tendons, and placed obliquely, the elasticity of that part softens the jar upon the bones of the leg, thigh, and above all upon the spine; in short, upon the whole column of the body. Hence the ease and safety of a high leap, if we alight upon the balls of the toes, as natural instinct directs, or the pain and danger, especially on hard ground, of a violent descent upon the heels.

How perfectly the foot is provided with all needful protection against injury in this way, is evinced by the fact, that such violent actions as leaping, either up or down, or being burdened with a weight twice or thrice that of the whole body, cause no uneasiness to a sound foot; the injury, if any, resulting from such exertions being usually felt elsewhere.

To prevent the grating or jarring which the contact of bone with bone would occasion, each is incased in elastic cartilage or gristle; and this, together with room for some movement among the bones, renders the foot more elastic. Strong bands of sinew, called ligaments, hold the heelbone and the forepart of the metatarsal bones just near enough together to arch the instep; another ligament holds the under-part of the scaphoid bone to the forepart of the heelbone; and thus not only are they held together, but when they are pressed down by the weight of the body, their elasticity allows the keybone to yield a little to the pressure, and when the weight is removed, brings it back to its original position.

Clearly, then, the arch of the instep, as admirable for its use as its graceful outline, depends upon the tension of the ligaments. When the foot is deprived of the free exercise from which its vigour grows, these ligaments are too weak to resist the pressure of the body's weight, and the instep is flattened. Indeed, the keybone is sometimes pressed down to the sole, so that instead of a hollow beneath the foot, this bone becomes a protuberance there. This deformity is called flat-foot, and is not uncommon among agricultural labourers who have worn tight stiff 'highlows' during their boyhood. But flat-foot may be caused by the mother's pride urging her darling to walk before his pliable feet are strong enough to bear the weight of his plump little body. Opera-dancers, acrobats, and others whose feet are unnaturally exercised during early childhood, occasionally have very low insteps. There is danger also at the time of adolescence, when the growth is often extremely rapid without corresponding vigour of constitution.

Until the ladies of our day resumed the antiquated fashion of high heels, these excrescences were shown up only in burlesque; and there is more than their ridiculous absurdity to be condemned in wearing them. The weight of the body is thrown upon the toes, which are thus unduly burdened, and thrown forward against the front of the shoe. But worse than this, the ankle has many a twist or wrick; the step is not firm or secure; and the further tendency of all this is

to give to the spine more curvature than even Fashion ordains in the 'Grecian Bend.' Add to these unlovely results the clatter of the heel-blocks, and we have a total not less disagreeable than that of the pattens of our grandmothers, which had at least the strong recommendation of utility.

It is true that high heels make the instep *seem* higher; but surely no proper-minded person would be guilty of a sham. And further, as the heel of the foot is kept up above its proper level, the muscles whose duty is to raise it are enfeebled by the loss of that exercise. These muscles are the calf of the leg, which will thus dwindle away to the leanness of decrepit age, and become a 'shrunk shank,' if this unseemly distortion be long persisted in. 'The animal machinery,' says Sir Charles Bell, 'can be seen in perfection only when it is kept in full activity. Exercise unfolds the muscular system, producing a full bold outline of the limbs, at the same time that the joints are knit small and clean. Look at the legs of a poor Irishman travelling to the harvest with bare feet; the thickness and roundness of the calf show that the foot and toes are free to permit the exercise of the muscles of the legs. Look, now, at the legs of an English peasant whose foot and ankle are tightly laced in a boot with an inflexible sole; and you will perceive, from the manner in which he lifts his legs, that the play of the ankle, foot, and toes is lost as much as if he went on stilts; and therefore are his legs small and shapeless. In short, the natural exercise of the parts, whether they be active or passive, is the stimulus to the circulation through them; exercise being as necessary to the perfect constitution of a bone as it is to the perfection of the muscular powers.'

The beautiful envelope in which this machinery is inclosed—the skin—very thin and delicate on the upper part of the foot, is on the sole thick and tough, though soft and pliable. Beneath this is a layer of fat, strengthened by strong fibres crossing it, and binding it to the muscles and ligaments, and preventing it from displacement by the weight of the body in its various movements. But although the sole can endure great pressure and even violent shocks, as in running, leaping, &c., yet it is curiously sensitive, especially to the touch. It is very easily tickled. But its ready response to the touch serves a very important, though less obvious purpose, in walking: the pressure upon the ground stimulates the muscles of the foot to their required activity, without any effort of the will; indeed, without our consciousness of their operations. This spontaneous alertness of the muscles on which the energy and grace of movement depend, can be secured only by their being kept uncramped, free, and well exercised. The value of this sensitiveness of the sole is best estimated, like many other benefits, from its occasional loss. For instance, when the foot is benumbed by cold or pressure, so as to be 'asleep,' what a laborious effort must be made to walk at all. The unconscious foot, an inert mass, must be lifted from the ground at each step, as if it were paralysed.

Happily, it is now becoming acknowledged—though not so generally as its importance demands—that the foot is more worth caring for than its covering, not *vice versa*, as in our parents' early days, when the foot was tortured into conformity

with the shoe. All honour to those who are striving to reform shoemaking, and to those who are not ashamed to avail themselves of their invaluable services. Till this reformation was begun, the shape of shoes had grown more and more unsuited to the feet; corns and bunions were all but universal; few feet escaped deformity. One of the fashionable perversions—a perversion which is still perilously persisted in by many young folks—was the *furor* for symmetry. This vitiated all arts: shoes could not escape it. The longest part of the shoe was the middle of the sole, not on the side where the great toe lies. And the poor toes suffered accordingly. Another mischievous falsity was that of representing hands and feet ridiculously small. The popular engravings represent women with hands and feet no larger than those of a half-grown child, the foot even smaller than the hand. The best antiques show the average foot to be about one-sixth of the whole height; in persons either above or below the ordinary stature, the feet are usually smaller.

To be properly shod, there must be perfect freedom of the toes. The following directions may help to bring the shoemaker and the wearer *en rapport*: (1) Have the breadth of the foot measured while you stand on it. (2) Allow fully half an inch more than the length of the foot. (3) Let there be space over the toes equal to their thickness. (4) Have no tightness anywhere; what pressure there is should be about the 'waist,' beneath the instep and on its sides. (5) Have the sole thinnest and narrowest at the waist, broad at the tread. Don't be ashamed of the size of your foot. A well-formed large one is a far pleasanter sight than the smallest one, distorted. And it is to be remembered that well-proportioned parts look smaller than they are. Is it worth the pain, the inevitable corns, the crooked, distorted toes, the graceless limping that come of wearing shoes one size too small?

## THE TREASURE AT GRAN QUIVIRA.

### CHAPTER I.

IN one of the loneliest passes or cañons of New Mexico, was the hamlet of Blue Creek. A spur of the huge Rocky Mountains, starting from the main ridge, stretched for several miles into the plains, a confused mass of hills and ravines almost impenetrable, save that here and there passes, opened by some convulsion of a remote age, gave a road to the traveller, and usually a channel for the stream. The streams there were often called creeks in the upper part of their course, rivers in the lower; thus, fifty miles down, Blue Creek was called the Little Ute River. In places, this cañon spread to a great breadth; the huge rocks withdrew for perhaps a couple of miles on each side of the turbulent waters; while here and there they approached so closely, and the ledge between their base and the torrent became so narrow, that logs were fastened to the margin, to make the road at all practicable for vehicles.

Although the mountains through which the Blue Creek foamed were but tributary to the great chain of the Rocky Mountains themselves, the sides of the cañon often consisted of tremen-

dous precipices, with nearly a thousand feet in sheer straight descent; and the ravines which cleft the sullen mass at intervals were as gloomy and awe-inspiring as any on the continent.

Much of the country around was rich in gold, and, several times, reports of great deposits near Blue Creek had been spread; but the result was always disappointment, as the precious metal had never been found in remunerative quantities. The population was therefore, very scanty; and for thirty miles along the Creek, no town or city—they were all towns and cities at starting—existed of importance equal to the settlement which bore the name of the stream itself; and this consisted of six or seven houses, built of *adobes* or the unbaked brick of the country. The plateau on which the hamlet was built was of considerable extent, and being easily irrigated by a couple of small mountain streams, which ran across it, and then fell into the creek, might have produced great quantities of vegetables; but there was no market for them, and the residents had no heart to cultivate them. The residents, indeed, were scarcely the men to delight in steady toil in field or garden; their antecedents had rarely qualified them for such a life. Fitful starts of exploring for gold, a bear or 'silver-lion' hunt—the puma is the silver lion in New Mexico—some felling of timber for the nearest towns: these were the pursuits by which the men lived. While the women—there were but three—made a little butter, which, with such eggs as they could spare, they sent for sale by any passing vehicle.

In the principal house—which was twice as large as any of the others, and was possibly intended for a store or an hotel by the sanguine builder, lived Josias Tate—Sy Tate, in ordinary parlance—with whom dwelt his grand-daughter Annie, a girl of some twenty years of age; Sy being a lean, hard-looking, weather-beaten fellow of something more than threescore, but as tough and resolute as the youngest man in the Creek. He lived a quiet enough life there. There were few to quarrel with him; but he was not a popular man in his little circle. Western society, especially when represented by such communities as Blue Creek, is not squeamish; and of the few who had their 'location' there, scarcely any would have found it salutary to reside where police-officers were known, or where the law took an uninterrupted course. Therefore trifling offences, peccadilloes which arose from a too sensitive nature, such as murder, or from too keen an appreciation of the beautiful, such as horse-stealing, were not considered to lower a man's character. But Sy Tate was morose and silent, holding himself aloof from those around, except in matters of business; was known to be a dangerous man to offend, and an unforgiving enemy. Yet even these things might have been pardoned; but there was a vague rumour—untraceable, perhaps, but in every man's mind, though none spoke of it in Sy's presence—that he had once been a renegade among the Indians, had lived many years in their villages, and had been concerned in some of the most appalling massacres which had ever occurred on the frontier.

This alone was enough to render him a marked and avoided man; and in a larger community, he would probably have been shot by some drunken avenger of his supposed crimes; but here there

were none who cared to risk their lives in purposeless quarrels, and Sy was useful in his way. He was fearless beyond even Rocky Mountain daring; and for hunting the bear or silver lion, no one for a hundred miles around could pretend to the experience and judgment of Sy Tate; while he was the best gold prospector in the country. So, even though he was hated, or at the least disliked, he was safe.

If there were one person in the little settlement who held Sy Tate in no apparent dread, it was Annie, his grand-daughter; indeed, by the consent—reluctant and sullen enough, no doubt—that he always yielded to her wishes, she seemed to have the ascendancy over him. Annie had no companions or friends. There were but two other women at the Creek, and these were much older, and of a coarser and rougher mould altogether. Annie had the robust strength and fearless activity of a dweller in the wilderness. She could shoot well, ride barebacked horses, drive a wagon, or scale a steep ravine with as cool a head as the oldest miner. She had also been to school in Santa Fe for some years, and could read and write, and embroider in a manner which not only excited the envy of occasional lady-visitors, but also the admiration of the stray Indians who came up the Creek, and who were especially clever at such work. She had a few books too, and occasionally bought others; Andy Macgregor, the regular freight teamster, whose ox-wagons toiled slowly through the cañon about once in three months, being her agent for the supply of these treasures, to purchase which she sent by him feathers from her fowls, and skins. Sy would probably have prohibited this wasteful luxury, had he dared; but it was plain he dared not forbid it; so Andy brought the novels, the illustrated papers, and the 'poetry-books' unchecked.

The days and years rolled on with a dreadful monotony, as judged by the standard of cities, or indeed of civilisation; but the days were neither long nor dull to those who dwelt in these mountain wilds. The bright exhilarating mornings of New Mexico, with the sun, that rose in unclouded splendour for months together, the sights and sounds of the wilderness, were enough for them; while lonely and exposed as their homes might have seemed, yet of all crimes in the West, teeming though the district was with utterly lawless characters, that of housebreaking was the least in vogue, as if detected, it meant death to those who attempted it.

It was in the spring-time of the year, when Annie was returning after a long ramble over the hills. She carried a light rifle; but no game had fallen to her weapon that day; nor was she much disappointed, as she had set out more to satisfy a restless desire for change, than in the hope of sport. Nevertheless, as she passed a certain hollow, where one of the mountain streams already mentioned formed a broad and deep pool, a resting-place before it rushed hurriedly down its steep channel to join the Blue Creek, she remembered that the best mountain trout of the district were to be found there, and determined to take some home. She carried the necessary lines, &c., in a pouch, and a wand could easily be cut from a bush to serve for a rod. So, slinging her rifle across her shoulder, she swiftly

descended the almost precipitous slope, which would have tried the nerves of a town-bred maiden, occasionally swinging herself to a lower ledge by the aid of a shrub, until she was by the side of the pool.

There were many bushes and trees such as love the neighbourhood of water, growing there, and she sought to find a suitable branch. An enormous block of stone, which at some distant date had fallen from a neighbouring rock, lay between her and a bush which seemed adapted for her purpose. She stepped quickly round the block, and seizing a slender bough, drew it towards her. She had opened her knife, when close at her feet—proceeding from the earth itself as she at first imagined—a voice suddenly said: 'Thank heaven! here is a human being at last.'

The girl's nerves were too firmly strung to be easily disturbed; yet she uttered a slight exclamation, and sprang back in alarm.

'Do not be alarmed,' continued the voice. 'I am so far from being able to harm you, that I sorely need help myself.'

She had recovered her coolness ere even this short speech was finished, and saw that the speaker was a young man, dressed plainly enough, but yet—as a woman would instantly determine—in a style which no miner or drover of that country ever affected; a pleasant-looking, handsome young fellow. He was seated, apparently at his ease, in a nook of the rock, while by his side was a rifle.

'How did you come here?' asked the girl; 'and what help do you want?'

'I really can hardly tell you how or why I came here,' returned the stranger. 'The immediate cause was that I slipped while coming down the hill just in front of us, and have hurt my foot, so that I cannot stand upon it. I began to think I should remain here until morning, or perhaps till doomsday, until I saw you come round the end of this rock. Do you happen to know where Blue Creek is?'

'Yes,' said Annie. 'I live there.'

'Thank fate!' exclaimed the stranger, 'for I may hope it is not very far. Do you think they can send a wagon for me? I was going there when I met with this unlucky tumble.'

'I don't know whether any one could come,' returned Annie thoughtfully. 'We have but few citizens there, and most of them were away to-day. Yet you shall not be left here. I will go across at once—it is not more than two miles—and will return with our light wagon.'

'It will be dark very soon—will it not?' pursued the stranger.

'No,' replied Annie, with a glance at the uplands, on which the rays of the descending sun still glowed. 'Yet it may be dark before I get back; but there will be a fine moon, early. Anyhow, stranger, if it were black midnight, I could drive through the pass. You will not mind my leaving you alone?'

'I am too glad to have seen you—to know that I am found, to care for anything now,' responded the young man. 'I may as well mention, perhaps, that I was directed to a Mr Sy Tate, by the landlord of the hotel—he called it an hotel, and he was, I believe, a Colonel—at Caroline Town. You may possibly know Mr Tate?'

'He is my grandfather,' replied the girl. There

was a moment's hesitation before she replied, which the stranger did not notice, while a deepening of the colour in her brown cheek was hidden by the gloom of the ravine in which she stood. 'I am Annie Tate.'

'Indeed!' exclaimed the other. 'Then I am really fortunate. Pray, do not wait any longer with me, as I should not like you to travel through such roads in the dark. I shall not feel the least uneasiness during your absence.'

The girl smiled assent; but without further speech turned away, and in another instant had disappeared.

'I will never despair again,' muttered the young man. 'Things looked as badly for me, I fancied, as it was possible; and I am sure I saw a bear cross yonder ridge. I had made up my mind to a single combat with him; perhaps it would not have been a single combat, by the way, for Mrs Bruin and the young ladies and gentlemen of the family might have made a free fight of it.—What an amazon!—I mean Miss Tate, of course. She carried a rifle, and I do believe a revolver also. It was a good job for me, no doubt, that she was such a resolute, adventurous young party. But if her grandpapa at all corresponds, I shall have struck a nice little family.'

The stranger had plenty of time to meditate; for the absence of Miss Tate was prolonged so greatly that the last golden tinge had disappeared from the highest hill-peak, the yellow glimmer of the moon had shown above the eastern range, and then the bright shield itself shone, nearly at its full, in the sky, making every crag, every tree, brilliantly visible; but the low-lying hollow where the traveller had fallen was in profound shade; and despite of his resolution, he began to grow nervously alive to real or imagined sounds, as of soft and stealthy footfalls, which seemed ever and anon to reach his ear. These might be the tread of bears, of mountain lions—another name for the puna—or of Indians, still more dangerous, abroad that night. He looked more than once at the lock of his rifle; and far oftener than once, strained his ear to listen for the roll of a wagon.

At last it came—the wagon, not the roll; for on that soft natural road, the wheels produced scarcely any sound; and coming in a somewhat different direction from that in which he had expected to see it, the vehicle turned the side of the huge block under which he was lying, and rolled out before him with a suddenness which startled him. Two persons were in the wagon. One was Miss Tate; the second was a man whose swarthy features, and afterwards his speech, declared him to be a Mexican. This latter bore a lantern, and being a stout, powerful fellow, was able to assist the injured man until he stood upright; then, almost carrying him on the one side, while his fair companion supported him on the other, the stranger managed to limp to the rear of the wagon, upon which the strong arm of the Mexican easily enabled him to take his seat.

'You will sit by the stranger, José,' said the girl, 'and steady him over the bad places. I will drive.'

With this they started off; and the young man soon found that the precaution in reference to 'bad places' was by no means an idle one.

During his rambles in the West, he had seen

and ridden over many bad roads; but this track had no right to call itself a road at all; and how any horse could face such dips, could climb such ascents, or how any vehicle made by mortal workmen failed to be knocked to pieces, our stranger was at a loss to conceive. His injured foot, however, claimed too much of his attention, to allow him to be very particular about the road. Having lain so long in one position, the first pain of his injury had been succeeded by a dull numbness, unpleasant to bear, but the exertion of moving to and getting into the wagon had partially restored the circulation, and now a pain set in which was almost sickening in its agony. He bore it as well as he could; but the Mexican, who was watching him closely, spoke, as they crossed an opening where the moonlight fell strongly upon his face: 'Say, boss! haven't you got no whisky in your flask? You've got a flask, I reckon?'

'I had a little when I fell,' returned the stranger; 'but I drank it.'

'Guess you'd better have some of mine,' continued José, drawing a bottle from his pocket, and extracting the cork—cup or glass he had none. 'You're looking pretty bad, I tell you.'

The stranger hesitated; but Annie, who had turned half round on the seat, and had listened to the dialogue, resumed her authority: 'Drink it, stranger. If José tells you to do so, it is right. He is the cutest Mexican in these parts; and you look like swooning—you do. Drink some.'

Thus commanded, the young man drank at several gulps—for the spirit was raw and fiery—such a quantity as José deemed requisite; and although the pain was not abated by this, he felt himself better able to endure it.

After a tedious ride over what might have been ten miles, rather than two, so toilsome was it, if not actually dangerous, they arrived at a broad level space, green and pleasant enough, skirted by precipitous hills, rising from one to two thousand feet; and here, irregularly scattered in the centre of the area, were a few small dwellings, looking very black in the moonlight which silvered the landscape. Three or four men were visible, as they leaned against a rude fence, smoking; and this was the settlement at Blue Creek, this was the bulk of its population.

A tall, harsh-featured man came forward as the wagon stopped, and intimated in tones well suited to such an exterior: 'I am Sy Tate. What did you want with me?'

'I was advised by Andy Macgregor to call upon you,' returned the stranger. 'He will be here to-morrow with my satchel, I expect. He thought you might be able to accommodate me for a day or two. I am sure I have reason now to hope you can.'

'And who mought you be?' was the inhospitable reply.

'My name, if you are asking that,' said the stranger, 'is Elkley—Gerald Elkley. I come from Boston. I am Boston born; but have lived most of my life in Europe. I am on a tour of pleasure in the West. I trust you can give me a few days' rest.'

'You say Andy Macgregor knew you were coming here?' returned Tate. It was curious to notice that immediately he had asked this ques-

tion, he glanced furtively at Annie, and seemed a little disconcerted by finding her eyes fixed searchingly on him.

The stranger answered in the affirmative.

'Wal, I don't know,' continued Tate. 'We have no fitting place here for cripples or sick men. You can't have a doctor here. Old Doc. Jemmis at Camp Water is the nearest medicine-man, and he is nigh on a hundred miles away, and is always drunk.'

'Never mind Doc. Jemmis,' said the clear decisive voice of the girl. 'José here can set a limb if needed; but I don't think this hurt is so bad as that.—We can take you in, stranger, till you are well. José shall be your doctor. If you are rich, you can pay Sy Tate for the trouble and expense. If you are poor, we will keep you until you are well, for nothing. That's the way out West.—Am I right?' These last words were addressed to the listening group, which now included a few more men, and two women—every one, in short, who lived at Blue Creek.

A low assenting murmur rose from the men; while one of the women spoke aloud: 'Ye're right, Annie Tate. No man, Sy Tate or any other, shall send a sick stranger from these roofs, to die on the mountains. If he would not take him in, we would—and shame him.'

Sy in his turn grumbled something which might have been meant in exculpation; it was evidently intended as a welcome as well, as he turned to the door, and signified to José to lift the stranger from the wagon. This, with the assistance of a couple of the bystanders, was soon done; and Gerald Elkley was placed on a couch in a rough, unpapered, unpainted, but by no means uncomfortable room, where José skilfully and tenderly bathed his foot with some potent lotion, and then bound it tightly in bandages.

When left to himself, he decided, as he recalled the interview with Mr Sy Tate, that all was not absolute peace and tranquillity even in so remote a spot as Blue Creek.

### MONSIEUR LITTRÉ.

MAXIMILIEN-PAUL-EMILE LITTRÉ, whose name is so intimately associated with the great French Dictionary, and whose death was recently reported, was born in Paris, February 1, 1801. His father was somewhat remarkable. Brought up at Avanches, the son of a jeweller there, he found life dull and irksome, and enlisted in the Marine Artillery. Many years of his life were spent in the service in different parts of the globe, till at last his good character for honesty and probity obtained for him a Bureau in Nantes. Here he was able to give himself up to his love of learning; and he devoted all his spare hours to the study of Greek, and later on to that of Sanscrit, for the benefit of his son Max. Ten years afterwards, that distinguished son, and Barthélemy de St-Hilaire, that son's friend, both dedicated to his memory their first works. On the removal of the family to Paris, it was the delight of the elder Littré to gather round him in his garden, on half-holidays, his three children and their companions—Hachette, Burnouf,

Bascou, &c.—to discourse to them with enthusiasm on the delights of learning, to imbue them with his own love of letters, and to impart to them his opinions on the philosophy of the times.

Littré's mother was a quiet, believing woman, of a strong character, devoted to this son, who repaid her affection with a love almost amounting to worship.

At the Collège St-Louis he seemed to carry all before him, coming home, as a matter of course, 'burdened' with prizes. To great mental power was added extraordinary physical strength; in all athletic contests, such as swimming and wrestling, he was always the first. It was owing to an accident—putting out his shoulder while diving in a swimming-match—that he missed his chance of entering the Ecole Polytechnique, the goal of his ambition. Unable to get a medical certificate, he was compelled to accept a Secretaryship to Comte Daru; but finding the occupation most uncongenial to his tastes, he resigned it, and worked steadily at medicine and botany for the next eight years of his life, with the view of being a doctor. He increased at the same time his knowledge of languages, though he could already read easily and talk fluently in German, English, and Italian. With his old playmate Burnouf, he continued his studies in Sanscrit and Eastern languages, laying a foundation for his later philological researches.

Littré never took his degree of Doctor. His father died about this time, and though it is not quite clear why a future so promising was thus suddenly abandoned, it is to be feared want of means to establish himself suitably, robbed the Faculty of one who would surely have been one of its most brilliant ornaments.

The care and maintenance of his mother fell to his share; and for more than two years he supported the little household by giving lessons in Greek and the modern languages, and by writing occasional articles for the medical press and the *Journal des Savants*. The *National* appearing about this time, he was employed in the humble capacity of translator from the German press, till some chance contributions attracted the notice of the editor, from which time he became one of the regular staff, and was the means of raising the paper to the high position it held for so many years. He contributed numberless articles to the *Revue des deux Mondes* and all the leading periodicals. In 1839, he published the first volume of an edition of Hippocrates, with a version in French, the tenth and last volume of which work appeared in 1861. He also made a translation of Pliny's *Natural History*. Overwork soon told upon his naturally strong constitution, and he became a great sufferer from a gastric affection, which reduced his strength, and changed him into a hollow-checked, sombre being, recalling strongly in feature the ascetic Lamennais. In 1841, the idea of a great Dictionary was first broached; but owing to the gigantic scale of the undertaking and many other hindrances, it was not actually

begun till several years afterwards. Even when it was fairly in hand, it was nearly abandoned in despair. Madame Littré, *mère*, died; and her son was so much affected by the blow, that for months he was in a low, desponding state, incapable of work. At last, being roused from his torpor by the entreaties of Monsieur Hachette, the publisher of the Dictionary, he set to work at his stupendous task again; and in an interesting brochure called *Études et Glanures*, he gives some details as to the immense labour it entailed. 'Twenty-seven years in all,' he says, 'I worked at the Dictionary; ten years at the translation of Hippocrates; four years at the edition of Pliny; three years on the revising of Neysten's Dictionary.'

Sixteen hours was the daily allotted time for work, distributed as follows: nine to twelve; one to six; seven P.M. to three A.M. This, day after day, for years together. One month's annual holiday was the limit allowed for recreation. This respite was generally spent on the coast of Brittany, at out-of-the-way St-Quay.

M. Littré's colleagues were Messrs Beaujeu, Jullien, Bandy, Soummer, Després, and André. Having applied for help in sorting books of reference, &c., M. Hachette appointed Madame Littré and her daughter to this labour; and for many years they worked with the lexicographer, till at last, in 1865, the revising of this Dictionary, which had been begun with such doubts and fears, was finished, though the work did not appear in print till much later. The *Life of Strauss*, translated from the German, had appeared in the meantime, and the edition of Comte. These doctrines were warmly defended by M. Littré; but it must be remembered he never followed the opinions contained in the later writings of A. Comte, and warmly defended the widow in an action she brought against the executors for publishing the later manuscripts. The writing of the *Life* was undertaken at great personal sacrifice, representing, as he himself tells us, three hours of night-work for a whole year, snatched from his other countless undertakings.

His tastes were most simple. In his unpretentious home in Paris, and his little country-house in the environs, he passed his time in great retirement, devoting what little leisure he could to practising amongst the poor gratuitously. 'In this nineteenth century,' says Sainte-Beuve, 'full of charlatanism of literature and all else, this original and unassuming character will stand out in bold relief; no crying up of worthless wares; but systematic hiding under the bushel,' &c. M. Littré was one of the most learned men of the age, and a perfectly dignified type of the advanced Liberal. Unable—wanting the power—to speak in public, he won his great influence chiefly through his energetic writings. His criticisms were deep and incisive.

In 1870 the war broke out; and M. Littré, already an old man, was forced to flee to Bordeaux. Here Gambetta offered him the Chair of History in the Ecole Polytechnique; but in 1871 he returned to Paris, and was named Deputy of the Seine in the National Assembly, and backed the policy of M. Thiers. On the 30th of December, he was for a second time a candidate for election to the vacant *fauteuil* of the Academy, on the death of M. Villemain; and this time succeeded.

M. Littré passes away from us, leaving many devoted friends; and behind him, a work which will remain a monument in French literature.

## MY TROUBLES IN RUSSIA.

### TROUBLE THE FIRST.

I HAVE been travelling without intermission all night and the greater part of a day between Berlin and the Russian frontier, Verballen; and I hope to proceed 'without let or hindrance' to my destination, the university town of Dorpat. It is the month of August, and blazing hot. I am in a third-class carriage, full of trading Israelites, and the air is heavy with garlic. Moreover, I have been forming part of an interesting tableau for the last six hours with one of the chosen race, who has been falling asleep at intervals and letting his oily head slip on to my shoulder; which you may be sure I do not bear patiently. The combined result of all is that I am hot, dusty, weary, headachy, thirsty, and cross.

I am only eighteen, and trying my wings for the first time, and need scarcely add that I am a governess; for what English mother's child would be journeying alone towards the land of barbarians but one of my profession? Not that I would draw upon the reader's pity; for I have been very jolly and hopeful, and much amused nearly all the way; but really things have been a good deal against me those six hours. The train seems to crawl along; and the engine belches forth great volumes of stifling smoke, and makes more noise than a score of English engines. But we stop at last, and this is Verballen! I am out of the train in a trice, and surge upon the platform amidst a sea of tearing, struggling, excited people, each screaming at the top of his, or her, voice in a different language, and frantically dragging luggage about. I am carried hither and thither, powerless, at the mercy of this human tempest, until I drift at last into a large square hall, which is station, custom-house, money-exchange, refreshment, and other minor offices all in one.

I sight my boxes with their brand-new covers, and rush upon them breathless and relieved. Piles of luggage stand about, waiting to be examined by the custom-house officers, amongst which a number of wild, dishevelled females run riot. The men are quieter; they hold out their keys to the officers, and get served first. It is amazing the number of officials that are required for so simple a matter. There are numbers examining the boxes, numbers looking on, and numbers at a table in the centre of the hall, inclosed by counters, where passports are examined. I sit down on the top of the biggest of my boxes, and wait; my turn may come some time. Not that I feel calm. I am almost blinded with excitement, feeling sure the train will move on without me in the end; but as I cannot speak Russ, I resign myself to wait until such time as I shall fall under some one's notice.

I watch my Jewish friend—he who has slept

so peacefully on my shoulder—engaged in a haggling contest with officials. They splutter and hiss and scream at each other over some wares; but the Jew, of course, is worsted, and pays out some dirty paper roubles, one at a time, whilst his voice declines from a scream into a whine. I sit and watch from my perch with uneasy interest, taking in other scenes of like description with eyes which smart with being opened too wide, until the hubbub has almost subsided, and people are scolding their mouths with coffee and tea. Then, there being no one else, I am at length taken into consideration.

I give up my keys with trembling fingers, turn red and white and red again, and feel painfully conscious that I am looking as if I had quantities of smuggled goods concealed. Half-a-dozen officials have seized upon my boxes, and are tearing the strings off the covers. One, whose business it is to look on, asks me something in Russ, as the lids are raised. I look at him cringing, feeling that I am looking more like a culprit than ever, and mournfully shake my head. The men are beginning to searft; but on a sign from their superior, the lids are slammed, and I am once more in possession of my keys.

What next? I look around bewildered; but find myself unceremoniously pushed to the counter, where a Russian hand, white and bejewelled, is held out for my passport. I keep this precious talisman in a little leather bag attached to my belt; and after much nervous fumbling at the steel clasp, which is stiff and obstinate, it is produced. Then a period of awful suspense. I watch my passport travel round the table from hand to hand; then a consultation takes place over it, and—it is laid aside! I see one passport after another signed and returned to its owner, and the owner dash off to the refreshments, but mine still lies unheeded. Now I am absolutely the last at the counter, and my breath comes short and fast. What are they going to do with it and me? An official approaches me—evidently the chief—and puts a question. I shake my head dejectedly in token of my inability to understand; and at this moment his arm is touched by a clerk in uniform, who holds my passport out, and explains something. The lump in my throat, which has been gradually swelling, now almost chokes me as I watch the two faces. The handsomest and kindest—for it is both a handsome and a pleasant face—is turned to me again, and this time its owner addresses me in good English.

'I am sorry, Madam, to have detained you; but it would appear that there is some omission in your pass. You have not had it signed in Berlin!'

'No; they never told me; I did not know'—with a tearful quiver in my voice.

'Ah, it is a pity. This will occasion you a little delay; the pass must be returned to the German frontier.'

'But what am I to do? Shall I not be able to go on with this train?' I ask in gasps.

Alas! the two doors leading out to the platform are being unlocked, and already passengers are streaming forth to resume their seats. Burning tears rush to my eyes and obliterate my vision; I dash them away impatiently, so intent am I on reading the thoughtful, sympathetic face before me.

'I regret it much,' he continues; 'but you cannot even stay at Verballen, where I should have had pleasure in waiting on you, but must return again to Edkunen.'

My cup of woe is full. I lean heavily against the counter, in despair, and give myself up to dumb misery. My friend—for such he now is—lifts a leaf of the counter which divides us, and passes through to my side.

'No, no; do not be so distressed,' he says soothingly. 'It is nothing, I assure you—nothing at all—a mere form. You will have everything done for you; I will give special charge. You will be conducted to Edkunen, and escorted to an hotel which is comfortable, by this gentleman' [here I uncover one red and swollen eye, and behold another Russian official standing at a respectful distance, cap in hand, waiting to 'take me up']; 'and to-morrow, at three o'clock, he will come for you again, to conduct you back. It is nothing at all, I assure you.'

He says a great deal more which is very kind; and through it all I hear the engine shriek and puff away towards Plesow, leaving me behind.

When a hardship is inevitable, it becomes easier to bear; my tears already begin to stream less copiously, and at length cease altogether; and I look—still with deep dejection—away out of the window at the bright sky.

'But I am sure you have not eaten for many hours,' says my friend at length; 'you will take some refreshment before you set out on your little journey.'

I shake my head. (To talk of eating to me!) But he leads the way to a small table, and orders two cups of tea and some cakes.

'Now, this warm tea will make you feel equal to anything; not that you have anything to trouble you,' he hastily adds. 'It is a mere form;—a little tedious, perhaps, but nothing.'

I have seated myself on the edge of a chair, and watch his busy fingers with side-long glances. He is peeling a lemon which was served with the tea, and drops a piece of the rind into my cup.

I take up my spoon and turn it over, as I say timidly: 'I cannot take tea with lemon rind in it.'

'Ah, it is delightful! Try it; you will see how well it accords with the tea.'

I sip a little with my teaspoon; and really it is not bad. The tea is excellent, and the flavouring, though strange to my palate, is by no means unpleasant.

He observes this at once, and smiles, well pleased. 'Did not I tell you?' he exclaims.

I find, when I begin to eat, that I am indeed faint with hunger, for I have fasted many hours. True, I had sandwiches in my bag; but how was one to think of eating whilst breathing an atmosphere rank with garlic, and with a Jew asleep on one's shoulder? So I eat slowly and mournfully, at first under protest, one cake and even two, whilst my friend chats away with his melodious voice. And after the tea and cakes, I too find my

tongue, and tell him, in reply to his polite, delicately worded questions, much about myself.

For some time past, my guard has stood waiting at the door leading to the platform; and towards it we now move.

'My boxes!' I suddenly recollect.

'They will be taken every care of until to-morrow.'

And we proceed; and I am handed with my 'escort' into an empty train—a whole long train all to ourselves!

'*Au revoir*, to-morrow,' says my Russian friend gaily with a graceful wave of the hand.

I nod, and even smile a wan smile—yes, I have arrived at that—and we creak and labour out of the station.

I record it here with pleasure—the gentleman who was courteous and kind to an English girl in distress, was a Russian official! A man of cultivation and refinement, he used his power well. Alas! that in a country swarming with officials, I should have to add that he was the only civil one I ever came in contact with.

#### TROUBLE THE SECOND.

I make myself as small as I can in the corner of the carriage, and my escort is in the other. The situation is awkward, and I feel embarrassed. Here I am in charge of a sort of policeman, and yet a person to whom I am indebted, who has kindly undertaken to do all he can for my comfort, and to save me all possible trouble. I should like to address a few civil words to him, but cannot speak his language. He is looking straight before him, and seems, like myself, to be aware of the awkwardness of the moment. Suddenly, he turns his gray eyes on me—eyes, sleepy and languid, with an undercurrent of cunning—and addresses me in German, feeling his way by the question: 'Fraulein is English?'

'Ja,' I answer.

'But she speaks German?'

'A little,' I again answer.

'Fraulein,' he continues, 'is much troubled to have to sit waiting in Edkunen for her pass; it is tedious for Fraulein. But I will do all; she need not be distressed. I know a good hotel; I will conduct Fraulein there; she has nothing to do but to wait, and all will be well.'

I thank my companion cordially. It is a relief to be able to speak to him; for what is more embarrassing than to find one's self *tête-à-tête* with a stranger whose language one does not speak? 'How kind and helpful, Russian officials are!' I think, and already begin to regard this one in the light of a friend. But we are at Edkunen, which is only a few minutes' journey; and we alight upon the deserted platform, and proceed to the hotel. It is close to the station, in what seems to be the only street—if it may be called such—in the town. It is interminably long and straight; is planted with rows of young poplars; and the houses at the high end, as it would appear, the German and respectable end, are clean, painted houses of wood, each standing in a little garden of its own. The hotel does not in any way differ from a private house, and looks cheerful and bright. 'After all,' I think, 'it is not so bad; and to-morrow will soon be here. Just twenty-four hours.' My escort leaves me

at the door with a military salute. I am met by a pleasant, plump, little German girl, with a complexion of dazzling red and white, who shows me my room; and I am alone.

After I have examined the German beauties on the walls, and gazed out of the window, until the opposite house in its trim angularity, the straight poplar trees, and the sandy side-walks have ceased to be novelties, the silence and tameness of my surroundings become intolerably oppressive, so I sally forth into the stillest, brightest evening. I wander up 'the street,' and see more wooden houses, more poplars, and more sand, with here and there a man or woman, who stare at me curiously. Only towards the termination, the scene gradually changes. The trees cease; the sand takes a dingier hue, which, as I proceed, deepens into dirty gray; and the houses become smaller, and lean their weather-stained shoulders one against another. I soon find that I am in a colony of Jews. My sudden appearance amongst them brings them out like a swarm of bees. It is Friday evening, and they are all unclean to a man. They will have to wait for the 'Shabbat,' and what would be the use of wasting soap? I pass tumble-down sheds or booths, giving forth scents that are not odiferous; but I am buoyed up by the hope of a glimpse of the green country beyond. My hopes prove futile; for when the last little crazy hovel is past, I find myself before a tract of sand, a veritable desert, with scarcely a blade of green grass to relieve its dreariness; so I turn suddenly on the band of little barefooted heathens who are following at my heels, and retrace my steps. I remark that the old women amongst the chosen people look like veritable hags, with their nut-cracker faces and yellow wrinkled skins; and that the children almost all bear a striking resemblance to those two angels at the foot of Raphael's Madonna della Sixtine, with their curly heads and bright, glorious eyes. It is still fair daylight as I turn into my room; and I know not how the long-drawn hours get away, until the hotel-keeper's daughter puts her blonde head into the door and asks if I require supper.

I jump at the suggestion, and order coffee and eggs. Supper over, I go back to my seat on the window niche, till the daylight at last begins to wane, and I can see the indistinct outline of the stars; and now it is bedtime!

Next morning, I have the same dreary waiting till one o'clock, when I have called for and paid my bill, which I am relieved to find so trifling; and at a little past two, am waiting at the station. The train does not arrive any sooner for my precipitation; it is a quarter of an hour overdue, when it comes puffing and panting up to the platform as if out of breath. There is my escort with a paper in his hand. I rush to meet him, and grasp the precious document. When we are seated in the carriage, he remarks: 'Fraulein has a trifle to pay.'

I get out my purse with alacrity, and ask: 'How much?'

'Only four roubles,' is the modest reply.

It does flash through my mind that nine shillings, or thereabouts, is a large sum to pay for so small a matter as getting a passport signed; but I make no comment. I find, however, that excepting a few silver coins, I have no change,

my total funds consisting of a note of twenty-five roubles. I explain. He is all complacency. 'Fräulein can change at Verballen; there is no hurry.'

Alighted on the platform at Verballen, my escort keeps close to me; but I think not of him, but of my Russian friend of yesterday. In vain do I scan each face of the uniformed group at the table in the centre; he is nowhere amongst them; his chair is filled by another.

I am one of the first served to-day; my passport is glanced over, signed, and returned to me without comment; and I turn to a 'Punch-and-Judy' box, wherein is a money-changer—a fact which he proclaims in several languages on a board above his head. He is a man of forbidding countenance—dark, sallow, gloomy-looking, with a morose, rolling eye. I hand him my note in fear and trembling, and ask, in German, to have it changed. He takes it from me, scrutinises it, raises his eyes, and looks sternly and steadily at me—I feel that I am looking as if I had stolen it—and asks: 'How much do you want for this?'

'It is a note of twenty-five roubles,' I say, clearing my throat, and trying to make myself heard.

He looks at me again, and smiles—a smile such as I could fancy Macbeth to have worn when he did a murder—and threw the note down. 'That is not worth twenty-five roubles' (scoffingly); 'it is torn!'

I literally quake in my shoes. This is all the money I have left to take me to Dorpat. What if I should run short! The idea is too appalling to be dwelt on, and my voice is a feeble quivering treble as I inquire: 'What is it worth?'

There is a lurid shade comes over his face and a light into his eyes, as he deliberates a moment. It cannot be knowledge of the world, born of observation, for I am just a fledgling, so it must be instinct which whispers, 'This man is going to rob you!'

'I will give you eighteen roubles for it—more than it is worth,' he adds, with assumed carelessness. He takes it up again as he speaks, but his eyes avoid my anxious ones.

It would be too little to take me to my journey's end, I fearfully think. Despair gives me courage; and before the man is aware, I have snatched the note from his greedy gripe, and turn breathlessly away. I dart across the hall to a lady who is standing at the counter. 'Do you speak German?' I ask.

'Yes; I am a German. Why?'

'Will you tell me the value of this note?'

I hold it out to her as I speak.

'Twenty-five roubles,' she at once replies.

'But it is torn—the man says it is torn, and only worth eighteen!' I exclaim, betwixt hope and dread.

'What man? Where is he?' she asks indignantly.

'There!—I point across the hall to the culprit, who is sullenly eyeing us from his box—the money-changer.'

'He is telling you a lie; the number of the note is intact, and it is worth its full value.'

At this moment an official calls my informant's attention to her passport, and she is at once absorbed in her own affairs.

Where my escort has been all this time, I know

not; but he is now at my elbow. 'Has Fräulein got change?' he mildly inquires.

'No; I cannot get it,' I reply desperately, holding the note in my hand.

'Give it to me—I will get it for you.'

In a moment he has snatched the note from my fingers and is gone. It happens like a lightning flash; and I stand staring blankly at the door through which he has disappeared. The first bell is ringing, and the passengers are rushing on to the platform. I try to persuade myself that it is all right. I go over to the door and wait, cheating myself with a forced calm: It will be all right; he will return presently with the change; he dare not but return. One after another passes out; the refreshment tables are deserted; but still my gallant escort comes not. The second bell rings. My heart beats louder with every brazen stroke. The bell is rung three times with intervals of five minutes, so there is just five minutes left to get my ticket. I begin to feel rather giddy. A little matter would make me either laugh or cry immoderately; but I wait motionless and utter no sound; and still he comes not. The third bell is ringing! It is too late! Somehow, a mist—not tears, for my eyes are dry and burning, but something which debars vision—rises before my eyes as I creep slowly, very slowly, as if dragging a heavy weight after me, to a bench against the wall, sit down, and draw my feet in under me. I make no appeal to any one; I do nothing, and think nothing. I sit still, a gray bundle of dejection. I had once read a story called 'The Iron Shroud,' of a man who was shut up in an iron cell, with walls which ever from day to day closed in upon him, till at the last, when he could no longer stand upright, a bell was heard, and at each knell the ceiling descended lower and lower, till the victim knew and felt no more. I seem to know how that man felt as I listen to that other bell clanging forth my fate!

It has ceased, when a man rushes into the hall, looks wildly around, and discovers me. It is my escort! I spring to my feet, and rush upon him like a torrent.

'Quick, quick!' he cries. 'Here is your billet, and here your change. The train is moving!'

Everybody's head is out of the windows as we storm on to the platform; and I am lifted, pushed, buffeted into the slowly moving train.

I come to myself with a handful of paper, and an old gentleman—certainly a German pastor—looking curiously at me over his horn spectacles. When I have got back my breath, and am a little more composed, I smooth out my notes, and wonder what my ticket has cost. There are only ten roubles left! I look across at the pastor, and encouraged by his benign expression of face, I inquire the fare between Verballen and Plescow. I am told seven roubles. I count my change over again, and then I see how it is: my escort has kept eight roubles for his share, instead of four.

I tell my story to the pastor, and learn from him what it costs to cross the lake (Lake Peipus) to Dorpat. The sum he names is small, and I sigh a sigh of relief. I am saved!

As I jolt and rumble along—for Russian trains do jolt and rumble—and look down on the steaming marsh-land with its stunted shrubs, or up to the sun-bathed tops of the venerable pines into

whose shadow we ever and anon creep, I feel grateful—yes, humbly grateful, to my escort for his consideration in only having kept eight roubles!

(To be continued.)

### RAT-CHARMING.

'I WAS never so be-rhymed since Pythagoras' time, that I was an Irish rat, which I scarcely remember.' So said Rosalind in *As You Like It*, when she found what 'strange fruit,' in the shape of complimentary verses, grew upon the trees in the Forest of Arden. And in other writings of the same period, and later, we find allusions to the Irish practice of applying poetry to the destruction of rats. The practice, if not now quite extinct, is almost so. For the most part, means are now resorted to in which the connection between cause and effect can be more distinctly traced. Nevertheless, long years ago, and in a remote corner of the Green Isle, I once saw the poetic method adopted; and to the best of my observation, with singular success. Rosalind's merry jest lately brought it to my mind.

It was the Holiday House of our childhood—a country-place, where we were occasionally 'turned out on grass,' and where, together with our young cousins, we sometimes spent weeks at a time in a kind of perpetual picnic. I know not what domestic system obtains in that old house now, but I know that when Granny reigned, it was a children's paradise; discipline was unknown there, order was of little account, and compulsory work—at least for young people—a thing entirely unimagined. No school-books burdened Granny's shelves, and I rather think no birch-trees grew in her groves. The primroses that bloomed in spring in those tangled plantations, and in the borders of the damp meadows, were larger and more fragrant than any I have gathered since. How we used to twine them—together with the crab-tree blossoms—into festive garlands, where-with Granny was crowned at dinner-time, somewhat to the detriment of her muslin cap!—The meadows were greener there, I think, than any others I have seen, even in that greenest of all lands. Scarcely had the new-mown hay been raked into heaps, when the fields from which it had been cut were covered again with a tender verdure.

But there is no perfection in this world, and so it happened that once upon a time Holiday House—for so I call it in my fancy now—was troubled by strange visitants. Singular noises were heard at the witching hour of night, and bells were rung unaccountably, when all visible hands were in bed. Nora, Granny's favourite maid, began to grow pale, and to go about after dusk uneasily, and with scared looks. Nor was she much comforted when certain depredations upon Granny's stores, accompanied by other sufficient evidence, had convinced the household that rats were the cause of the disturbance. To Nora's mind, rats were scarcely less terrible than ghosts; indeed, I am sure her fancy invested them with some of the terrors of the supernatural. She had heard

many stories of their extraordinary sagacity, and she hinted that such contrivances argued more than rodent wisdom. Ordinary means, she concluded—open visible means—such as might be used by innocent people, would never rid the house of their presence. If they chose to make themselves a home in it, they would know how to hold their ground against traps and terriers; they would refuse to touch poison. She had heard, she hinted, of a person who knew how to banish them; but his art was a secret, and such as might not be practised by ordinary men. Fain would she seek out this man and bring him to the house; but the mistress did not approve.

One night, coming into our room with a candle when we were fast asleep, she espied a black spot on my sister Bessie's pillow, a spot which fled precipitately when the light appeared. With a scream that rang through the house, Nora fell on her knees, and was praying and crossing herself frantically when Granny hurried in. She turned her entreaties to her mistress then, and clinging to dear Granny, she wept before her, and implored that she might—that very hour—be allowed to go in search of a man (she had heard her mother speak of him) who was possessed of a charm fatal to rats. The lives of the innocent children, she said, might be sacrificed if the Mistress persisted in her refusal; for if Bessie's guardian angel had not sent her—Nora—into the room at that moment, the rat would surely have sucked the sweet child's blood! Granny did not like the rats certainly; yet she was very unwilling to lend her countenance to the practice of occult arts; but it was not in her long to resist tears and entreaties. Besides, the girl was half wild with terror; so there was nothing for it but to consent. Early the next day, Granny promised her she should be permitted to go in search of the man, whose name even she did not know, and who, she acknowledged, might have died long since, without having imparted his secret to another. Nora spent the rest of the night open-eyed in our room, sewing, to keep herself awake, and did not thereby improve her mental condition.

Next morning, when we knew that business was in hand, all of us who were old enough to feel interested in it were for escorting Nora on her way; and what could that best of Grannies do but pack us up a basket of provisions, and send us off in the green donkey-car that had done duty before, on many a summer's day ramble. George, the eldest of our party, was charioteer. He had lately been reading *The Lay of the Last Minstrel*, and gave us an enthusiastic account of William of Deloraine's visit to the tomb of Michael Scott. Our expedition, he considered, was very much of the same nature; and he horrified Nora by suggesting that if the 'knowledgeable man' had died since she had heard of him, we should search his grave, in the hope of finding out his secret. To all but Nora, the whole thing was a summer day's frolic; and I am afraid we ill requited her ready sympathy with all our childish fears and troubles, by making her anxiety on this occasion the subject of our thoughtless mockery. It was a day's journey to find out that old man and to bring him back with us. Persistent inquiries of various individuals at length brought us upon the right track, and late in the afternoon we came in sight of the man we wanted.

He was a small old man, somewhat past the years of labour—sitting at his cabin door smoking a pipe, his little grandchild at his feet stringing daisies. He had long white hair, and a cast of countenance that even then gave me the idea of a covetous and unscrupulous character. To our disappointment, he drew Nora apart, in order to learn why we had come in search of him, and the few words we heard them exchange were in Irish. They were not long, however, in coming to an understanding, for Nora soon came back to us, looking more contented than she had done for some days; and she told us that if we would let the old man have her place in the car, she would take a shorter way across the fields, and meet us near home.

It was growing dark when we arrived at Holiday House, and Granny was on the steps looking out for us. I remember she kissed us all as we came in, but was not quite gracious to Nora, whose action she still regarded with disfavour. We were all very tired; Bessie indeed was carried in fast asleep, so that we could give Granny no account of our doings until we had been refreshed with supper.

Meanwhile, in another part of the premises the 'charmer' was at work. When Nora came to prepare the younger children for bed, she told us that before he would partake of any refreshment, he had called for a pen, ink, and paper; and having torn the last into slips, he proceeded to write on each piece some mystic words, that no one should on any account presume to read or to try to read. This done, the papers were rolled up into pellets, and placed, with ceremonies that none were allowed to witness, in every rat's hole that had been discovered. If they were removed or touched, not only would the charm be broken, but probably worse things than rats would visit the house. The charmer was then rewarded in money by contributions raised among the servants; for they would not ask the mistress to pay for proceedings to which she had consented only under protest. They scrupled not, however, to feast him liberally upon her good things; and after enjoying this repast, he left the house.

We were too sleepy that night to think much about the mysterious inscriptions; but next day they were the subject of many surmises; and by the afternoon, curiosity so far overcame the slight awe with which we had at first regarded the prohibition, that we resolved on the bold step of examining the papers—inquisitive and irreverent little people that we were, encouraged some that, I am afraid, by Granny. Having first made sure that Nora was well out of the way, we shut ourselves up in the playroom, where the rats had a favourite hole. With the help of a knitting-needle, George succeeded in extracting one or two papers. On each there was written a rude couplet, containing some exhortation to the rats to depart from the house. This is the only one I fully remember:

Black rats and white! blue rats and gray!  
Go down to Mr ——'s house, and never come back  
this way.

More merciful than his forefathers, our charmer had not sought to compass the death of the vermin, but only to pass them on to the neighbours!

I suppose the rats had already accepted this rhythmical notice to quit; for notwithstanding our

interference with the proper working of the charm, my recollection is, that the house was troubled with them no more.

Whether in this instance the benefit was permanent, I know not, as at Granny's death Holiday House passed to other hands; and neither under that nor any other roof on earth shall Granny's young visitors all meet together again.

#### THE RUINED ABBEY.

Thou dumb interpreter of vanished time!  
Long ling'ring relic of the buried yore!  
'Nenth misty years, whose quick-corroding rime  
Hath sprinkled thee, thou hast grown frail and hoar.  
But at this hour the moonlight o'er thee falls,  
And, like pale genius in a withered face,  
Brings back a transient glory to thy walls,  
By which the meditative eye may trace  
The greatness and the grandeur of thy prime;  
For, in the majesty of thy decay,  
Thou a mightier art than modern masonry.

Ere time and strife had marred thy lineaments,  
O'er all this land reverèd was thy sway;  
A crowd of ceremonious monks and priests  
Kept tedious vigils, held their fasts and long  
Within thy walls, and wore thy life away.  
The incense from thy altars rose like mist;  
The Virgin's ear was sued by many a prayer;  
While, from thy vaulted halls and cloister dim,  
Awoke the sound of psalm and chanted hymn  
A voice of peace upon the troubled air.  
Thou wert the sure retreat of penitents;  
Vassal and lord, from forage and from fray,  
A refuge found within thy sacred porch,  
Where, fresh from ruthless deeds, they might be  
shriven:  
Men deemed thy consecrated oil a torch  
Whose flickering flame could light the way to heaven!

To-day, what art thou? Crownless, desolate!  
No gathering-place for penitential souls;  
A haunt of twilight shades and midnight owls!  
No eye that looks upon thy ruin, grieves;  
But Nature, who is still compassionate,  
Regards thy crumbling form, and round it weaves  
With noiseless art, a robe of ivy leaves.

The generations who through ages long  
Besieged thy shrine, a benison to crave,  
Are long since dead—not one of them is left,  
To see thee of thy strength and glory left:  
The lord lies undistinguished from his slave.  
All are forgotten, save some hero's name  
An unknown minstrel may have given to fame,  
In the low breathings of a mournful song!

Thy shadow covers all thy kingdom now!  
A kingdom of the dead—the long-past race  
Who lie in mouldered graves around thy base:  
No more they need thy ministrings, yet thou  
To them giv'st all thou hast—thy aged form  
Still shields their dust from winter and wild storm.

## THE LIFE OF THE COLLIER.

THE circumstances which brought me into North Wales and have kept me there longer than I anticipated, need not be told. It is sufficient to say that they gave me many opportunities of making myself acquainted with the geological structure and condition of the small coal-field of which Wrexham may be regarded as the most important commercial centre; the system of working; and the lives, habits, prejudices, and general conditions of the collier, concerning whom I have a few words to say.

In times past, the working-life of a collier commonly began in his boyhood; for when he was only eight or nine years old, he was employed underground in opening and closing the doors which direct the ventilation; and in drawing the little wagons laden with coal, from the place where the coal was hewn, to the bottom, or as it is often called, the *eye* of the pit, whence it was raised to the surface. This hard and degrading work is now done by ponies, to the great relief of the weak and tired muscles of the collier-boys. This mode of haulage is now adopted in almost all collieries where mechanical arrangements are not applied. The labour of boys in coal-mines is therefore now confined to the opening and closing of doors in some situations, and the driving of the animals employed in traction. A growing improvement in the condition of boys working in mines has therefore been strongly marked during the last ten or twelve years; but whether the change has been the result of improved methods of management underground, or a more generous spirit on the part of the strong towards the weak, need not here be discussed.

The Coal-Mines Regulation Act, 1872, was no doubt forced on the government by the irregularity and severity of control underground, just as the Slave Emancipation Act was prompted by the cruelty of slave-drivers and their assistants. As soon as the protecting cords of infancy were broken, the collier-boy's life of hard work began, and the beginning was in darkness and danger, under

conditions not to be found in any other place than a coal-mine. Nor is this all that could be said about the sad history of boyhood spent underground, nor is it the worst. The fathers of the boys, though knowing by experience the suffering to be borne mentally and bodily, enforced the sacrifice, because 'it was time' that the boys were doing something to increase the amount of the weekly pay. So they took their children from their mothers' side to the pit to do the work of ponies in a heated, unhealthy, dust-laden atmosphere.

Still, the boys had been educated to their fate; and as soon as they could lift a loaded playbarrow, they talked about 'going down,' as if it were the necessity and preordination of their lives. The first words they spoke were those they most frequently heard—'pits and mines, carriers and screens;' and when they grew older, they talked with ignorant wonder of many contrivances for getting coal, and sending it away to be put into ships. They had created an ideal of their future workplaces and of the work they would have to do, for they had often heard descriptions of them from their companions; but the reality was more dismal than the conjecture, and fear came on them as they made their first descent into the pit, and took their first walk along unlighted galleries and roadways, long distances underground. The reluctance, however, with which they first stepped on the carrier, under the protection of their father or of some trusted neighbour, disappeared after a few days or weeks, when they ventured to crowd in among their young companions in the centre of the descending cage, pretending to a courage they did not possess, as the loaded carrier sank to the well-known last stage of their adventurous journey. Received there by the hooker-on, they were passed at once to the place of their work, and entered the dust-laden atmosphere, which they were destined to breathe for some hours every successive lawful day of their work-life.

Habit at last asserted its authority over the collier-boys. They found they had work to do;

and earnest in their determination, they did it, thoughtless of danger, waiting patiently every day for release after their toil, and a return to the sun-lighted bank and the green fields—to marbles and tops, and a pure atmosphere. They were the true slaves of the mine; but of their former condition little evidence remains, for they have been partly emancipated by the Coal-Mines Regulation Act, 1872, which forbade the employment of boys under twelve years of age for more than fifty-four hours in a week, or ten hours a day, and insisted on some attendance at the school-room. The effect of this relaxation of strain upon the young life of boys in collieries cannot be measured by any existing statistics; but without doubt, the reduction of the time of breathing an impure atmosphere has been no inconsiderable element in the relief that has been given.

Mention has been made of the excessive heat of coal-mines as one of the unhealthy conditions which the collier-boy must endure underground, for it must be understood that the deeper the mine, the higher the temperature. But the collier himself suffers not less severely in his daily work. Atmospheric air enters the mine at all the varied temperatures between frost and summer heat, and there receives the breath of men and horses, the heat radiated by lamps, and the gases evolved by the too frequent discharge of gunpowder. Together, these causes produce a considerable effect upon the atmosphere in deep mines, silently acknowledged by the collier when he strips for his work, to relieve himself as much as possible from the burden of an excessively high temperature. But with every precaution within the reach of workmen, the young, the least robust, and the hardest workers, suffer much in summer, as they must do when, for eight hours out of twenty-four, continuous hard work is done under such circumstances.

To reduce this unhealthy atmospheric temperature, a well-designed system of ventilation is necessary. By this is meant a circulation from the descending pit, through the workings, up the ascending pit, near which a furnace is sometimes built to increase the draught. Before the passing of the Coal-Mines Regulation Act, it was often said that one pit was sufficient for ventilation if that pit were well bratticed—that is, so divided as to form an up-and-down airway. But the Act says there shall be 'two shafts or outlets, separated by natural strata of not less than ten feet, in communication with every seam at work.' Supposing this order to be fully obeyed, the atmosphere is made more fit for breathing, and the temperature is reduced; but at the same time, in dry mines the atmosphere is loaded with coal-dust, which, besides being deleterious to the lungs, is, as we shall presently show, itself an inflammable and, under certain conditions, an explosive substance.

Boyhood ended, the first stage of a collier's life is complete. The boy becomes a man, and no longer does boy's work. Supposing him to have

skill and carefulness, he becomes a hewer of coal. What lessons have been taught him from the work of his past course of life? He has learned to be content, to work in darkness, to understand the prognostics of the approach of danger, to judge fairly the quality of coal, to know how to make the best of his work, and to believe he is not so strong as he would have been, had he never been in a coal-pit. He thinks his lungs are not quite right; and his friends are of the same opinion. He sees young men who had been his friends and companions, and went down with him in the same batch of men and boys, now thin, pale, and fatigued with comparatively little work. I do not mean to insinuate that all colliers have diseased lungs, or that old colliers are not to be found in the villages of North Wales; but I do assert that consumption is the most common and the most fatal disease among the workers in coal. And no wonder. They begin life with impaired constitutions; and their future, so far as health is concerned, chiefly depends upon the existence of a thorough ventilation in the workings where they may be employed.

Such are the ordinary conditions of life in a coal-pit, and they are all opposed to the conditions favourable to health. But to perceive fully the dangers of a collier's life, it is necessary to review the extraordinary conditions which threaten it. If workmen in collieries had no other reason for complaint than that of toiling in perpetual lamp-light, and in an overheated and impure atmosphere, they would have no more cause to regret their fate than have many other men who live by the labour of their hands. But although the ordinary conditions of a working-man's life are often oppressive and injurious, they are in almost every instance less violent and destructive than those to which colliers are exposed in their daily work. As soon as an opening is made in a bed of coal, chemical and mechanical changes of serious importance are commenced, and they are all more or less opposed to the permanence of the work. The oxygen of the atmosphere, aided by the force of gravity, lessens the barrier between the imprisoned gases and the opened places of the mine. Of these, the most abundant and dangerous are carbonic acid gas or choke-damp, and carburetted hydrogen or fire-damp.

Carbonic acid gas accumulates in disused workings, and not unfrequently escapes into the roads and workings. As it has a greater specific gravity than any other gas found in a coal-mine, it drops to the floor of the opening in which it happens to accumulate. For this reason, the upper part of a driving or a wicket may have a comparatively pure atmosphere; while the floor and parts immediately above it are occupied by a gas which, if breathed, would be destructive to animal life. When opening old works, or when approaching places partly opened, the collier must be cautious for his life's sake. He is meeting, without the power to resist, an invisible and insidious enemy—a life-threatening

agent, that strikes without warning. If a system of ventilation exist in the mine, there will be a means at hand of driving from its hiding-places a considerable accumulation of the deadly gas, if care be taken to watch the approach of the enemy. If there be no sufficiently comprehensive scheme of ventilation, the choke-damp must be diluted, or in other words the gas must be mixed with the overlying atmospheric air. This is often done, when the accumulation is locally inconsiderable, by the wafting of a miner's jacket backward and forward till the air can be safely breathed.

The other kind of gas just mentioned, is not less dangerous to the workmen. This gas is known as carburetted hydrogen, or fire-damp. As it is lighter than atmospheric air, it rises to the roof of the mine in which it is found, and is there mixed with the mine atmosphere, by occasional disturbances, or by the process of diffusion. Unmixed with other gas, carburetted hydrogen destroys animal life. But when the gas is largely diluted by atmospheric air—say thirty parts by volume of atmospheric air to one part of the gas—the presence of fire-damp is made known to the miner by a pale blue cap with a brownish tinge over the top of the lamp-flame. This gives a warning more and more imperative, until the proportion is only thirteen parts of air to one part of fire-damp, when the mixed gases become explosive. This quality continues until the proportion is one of fire-damp to four or five of atmospheric air, when the explosiveness of the mixture is lost, and the ordinary lights of the mine are extinguished.

The effects of gas explosions in mines are unfortunately too well known in this country to require detailed description. The orderly operations seen on the colliery bank—such as the rise of loaded wagons and descent of empty ones—are suddenly suspended, and a muffled noise underground is heard, not unlike the roar of thunder or the distant boom of ordnance. A flash of fire passes through the roads and into the openings wherever the gas has gathered strength, breaking down walls, ripping up rails, and setting fire to whatever can burn, and then filling the mine with suffocating and poisonous gas. But this is not all. The explosion may take place, and probably will, at a time of active labour, and then one man asks of another, on the surface, how many went down to work last turn. All else must be conjectural. How many victims—the scorched, burned, and slain—lie in the road, must remain unknown until the mine is purified, and search is made for the dead. Those who are unharmed by the fiery flood lie among the wounded and killed like withered leaves in the forest among the foliage blackened by the burning flashes of the storm. The fate of many is insensibility, and death if out of the reach of companions and fellow-workmen bringing relief from the surface. It must be so; for the explosion of carburetted hydrogen gas in a coal-mine, leaves nitrogen and, in a small proportion, carbonic acid gas; and if there be no access for pure air from above, the man who is

uninjured by the flame will die of suffocation, for the after-damp is unfit for respiration.

It would be strange if explosions were not dreaded in coal-mines. And yet the frequent presence of fire-damp in seams of bituminous coal, produces in the minds of men working in many collieries, a neglect of the indications of the safety-lamp, and an indifference to ordinary out-breaks of gas, instead of caution and watchfulness. It is not until the gas issues under pressure from a fall of coal in sufficient volumes to make its presence known by the sound peculiar to the passage of gas through fissures, that the collier seems conscious of danger—when what are termed 'blowers' are heard making noisy demonstrations. At other times, he forgets that quiet discharges into the mine make dangerous atmospheres, and is perhaps ignorant of the important fact, that changes in the barometric pressure of the external air govern the e-scape of gas from the workings underground.

But there are still other causes of fatal accidents. In addition to the dangers arising from the presence of one or both of these gases, another element of danger exists from the presence of coal-dust in the atmosphere of the pit. It is well known that flour-dust has on more than one occasion been the cause of fearful explosion, in those parts of flour-mills in which it accumulates; and in the same way it is found that coal-dust in the air of a pit renders the presence of fire-damp especially dangerous. While six or seven per cent. of fire-damp requires to be mixed with pure air to form an inflammable compound, one per cent. of fire-damp is enough if the air be likewise charged with coal-dust. The use of water in the shape of spray, and the application of water to the roadways of pits, might be the means of checking this danger. In the mine itself, many deaths are occasioned by the fall of the roof or side of the working-places, commonly occasioned by the want of sufficient supports, or 'sprags,' as the props are called. Explosion of gunpowder, irruption of water, collision of tubs and trains, especially on inclines, are also prolific sources of accident. In the shaft also, there is danger, for there may be overwinding of the rising load, breaking of chains and ropes, and falls from the carrier. Nor is the collier altogether free from a liability to injury from accidents on the surface, for machinery may break and boilers may burst.

That many of the accidents which do occur might be prevented by ordinary care and known precautions, admits of no doubt; yet, while present conditions remain, it may be correctly said that the collier holds his life upon a less secure tenure than other men.

Taking official Reports as guides, there must be on an average a thousand fatal accidents a year in the coal-mines of Great Britain; or, in other words, more than three in every working day of the year. A knowledge of this fact, aided to the daily perception of his own danger and the occasional sight of an accident, must have a strong influence upon the mind of the collier. He must either throw off the thought of danger and death as far distant and improbable events, or accept as a fact the more than usual uncertainty of life, and the necessity of preparatory acts, in the event of serious accident or sudden death. The oppressive influence of the latter condition of mind gives to

the man who possesses it a serious, waiting character, but withal hopeful and courageous. The other class of coal-miners, though indifferent to, and even thoughtless of what may happen in the work, are still self-possessed and brave, ready to act in time of danger, when that comes, and to do according to the necessity of the work, under the guidance of authority. Speaking of the North Wales colliers generally, they are quiet and courageous, and among them are many who have an abiding confidence in the constant guidance of Divine Providence.

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER XLIII.—BEFORE THE MAGISTRATES.

THE day had arrived on which, as the Southampton newspapers phrased it, Henry Crawley, Esq., confidential clerk to Messrs Mervyn, and Edward Blogg, were to make their second appearance in the police court. There had been a first appearance, of course, of the captured culprits in the same locality on the morning of the evening of the unsuccessful raid on Mervyn's Yard. But this had been, as sometimes happens, a mere formality, like the brief and dainty proceedings on the reassembling of parliament, and before Government and Opposition, and the Free Lances below the gangway, have tasted blood and warmed to their work. A remand had been asked for, and granted, on the usual grounds of time being necessary for the production of fresh evidence; and now the hearing of the case promised to be full of interest, and was regarded as certain to end in a committal.

The court was very full; there had been intriguing and importunity employed for the procuring of seats. The wedged-up public in the body of the building cheerfully endured rib-squeezing and semi-suffocation for the sake of the excitement that was to come. But presently a rumour pervaded the town-hall, a rumour that, as it travelled from lip to lip, gathered strength, and the drift of which was, that the expected excitement was not to come. The principal prisoner, the interesting criminal, was to be let off scot-free. The show was to be shorn of its chief attraction; and the British public, feeling itself defrauded of the spectacle for which it had come together, sulked and moped, like a theatrical audience that has gathered to see a star of the stage, and gets nothing but bland excuses from the management.

Three prisoners were placed at the bar. Crawley, first; then Chelsea Ned, the longshoreman; then old Isaac Bond from the marine store, were thrust into the narrow pen that was the centre of all eyes. The magistrates took their seats; the lawyers bustled in, and people whispered to one another that yonder was Mr Weston the Manager; that the florid, pleasant-looking young man beside him was a nephew of Mr Mervyn the shipbuilder, Arthur Lynn by name; and that the handsome, thoughtful face of their companion was that of

Bertram. Crawley himself had a sanctimonious look, and turned up the whites of his eyes, and turned down the corners of his mouth, in a manner that was possibly intended to express contrition. But if he looked hypocritically penitent, he did not look frightened, being probably reassured by the certainty that nothing very serious was about to happen to him. The longshoreman's foxlike countenance wore a weary, sullen aspect; while the old receiver of stolen goods coughed noisily in his corner, and made irrelevant remarks, which elicited reproof from ushers and policemen in waiting.

The case was called. The public craned forward numerous necks, and lent attentive eyes and ears to what was about to transpire. But the affair took a disappointing turn from the first. The lawyers, for the prisoners and against them, seemed for the time being a band of brethren, so complete was their unity of purpose. 'Your worshipships;' 'On the part of the prosecution;' 'No desire to press the case;' 'Charge withdrawn,' and so forth, came, in muffled tones, to the strained ears of an audience balked of its promised treat. There was some grumbling covertly. A compromise is never popular. There was a sad loss of dramatic effect when, instead of scathing censure and stern denunciation, nothing better was to be heard than smothered arguments between the attorneys and the Bench. The Bench, as represented by three unobedient men of justice, seemed a little ashamed of itself, and a little apprehensive of raps over the knuckles from the Right Hon. the Secretary of State for the Home Department, if the legal hounds were whipped off from the pursuit of their two-legged fox. But the lawyers for the prosecution ('I beg to submit,' and 'Ventured to affirm,' and the lawyer for the defence 'Made bold to a set,' and the clerk of the court was jocosely positive, as becomes an official who is so often the judicial dry-nurse of our unsalaried dispensers of justice; and Themis consented to tighten the bandage over her eyes, and to lay aside the sword, and hang up the scales, for once in a way.

'The case against Henry Crawley and Isaac Bond is dismissed,' said the chairman, with some reluctance.

'That will do. Mr Crawley need not stay.—Bond, you may go,' chimed in the glib clerk.

The chairman eyed Crawley as he made his meek bow, and his crab-like exit from the pen, very doubtfully. He had read of terse remarks which a judge, in the terrors of his ermine and wig, sometimes is moved to make when a prisoner is unexpectedly acquitted by some perverse verdict of a bemuddled jury, or eludes chastisement by slipping through some loophole of the law. And the magistrate did long to tell Mr Crawley, severely, that he had had a narrow escape, and that he hoped the escape would be a lesson to him, and to read him a moral homily, forcible, cutting, unanswerable. But he did not quite like to do it, having no scarlet and ermine and portentous wig to lend majesty to his reproof, and so the confidential clerk was allowed to steal off without being put in an extra-judicial pillory.

Then Isaac Bond, the marine storekeeper, imparted a comic element to the scene by calling on all 'gents and honest men' to observe that he, the

said Isaac, had been scandalously dragged from the shop where he, pre-eminently an honest man, if not a gent, and a martyr to the rheumatics, gained a blameless if precarious pittance, incarcerated 'in a vile dungeon,' and exhibited in public court, only to be released in consideration of his perfect innocence. Isaac was not too bashful to put in a plea for pecuniary compensation of a substantial sort, for loss of valuable time and defamation of character; and the general public, who knew that the old rascal had been released because it was impossible to forgive the thief and punish the receiver, recovered its corporate good-humour, and roared with laughter, as, after a half-jocular passage-of-arms between the aged dealer in stolen property and the officials of the court, during which the words, 'We know you, Bond;' 'You've been before us often, you see,' frequently occurred, the guileless Isaac was hustled out of the town hall.

Then began a bit of real business. The magistrates brightened up as Chel-sea Ned, identified by witnesses expressly brought down from London to swear to the identity of an old acquaintance, was asked what he had to say. The long-horsemann bore that ordeal philosophically. Driven from the primitive plan of simple denial, he really had nothing particular to urge, beyond the fact that he was 'a pore man;' and was accordingly committed for transference to London, there to be charged, arraigned, and in due course sentenced, for his share in the plundering of the clipper ship *Gable's Gate*.

Before the proceedings against the river pirate were quite concluded, Mr Weston, Arthur Lynn, and Bertram had left the court, the spectators eyeing them, as they did so, almost reproachfully, as persons who had been instrumental in defrauding their fellow-creatures of the pleasurable emotions which result from the righteous castigation of a knave. Even Inspector Birch, though liberally feed for what he had done, and certainly no loser through the clemency that had been extended to the chief offender, had been gloomy and taciturn.

At the door of the town-hall, Mr Crawley himself came sidling up. 'My humble, heartfelt thanks, gentlemen,' he began, 'for your great goodness to'—

'Enough, enough!' replied the Manager gruffly. 'Good-morning—that will do.'

'I am a good accountant, a useful servant,' went on Crawley, cringing, but unabashed. 'If, dear Mr Lynn, you, and noble Mr Mervyn, would'—

'For shame, sir! if you have any shame,' replied Arthur Lynn, manly indignation flaming in his honest eyes. 'Mercy is one thing, Mr Crawley, and you begged it on your knees, you may remember, abjectly enough. But to employ you again'—

'I do not ask for trust, only for salary,' pleaded Crawley—'I am so poor.'

'Your two accomplices,' answered Mr Weston wrathfully, 'have just urged the same plea for thrusting thievish fingers into their neighbours' pockets. Some of our sovereigns, Henry Crawley, if all truths were known, and a good many of them, must be in yours yet.'

And Crawley crawled away, and for the present was seen no more.

'Bertram, you must come home and take luncheon with us to-day,' said Mr Weston cordially. 'The ladies expect us all, and we can take no denial.'

### THE LOO-CHOO ISLANDS.

Nothing is more significant of the world's progress in civilisation than the changes which have recently taken place in Eastern Asia. This is especially the case with regard to Japan, where the barriers of exclusiveness have been broken down, and the country opened up to foreign intercourse. Not only has this been accomplished; but the Japanese reformed government have annexed the Loo-choo Islands, situated between their own isles and China, to both of which nations these islands were tributary. This circumstance has revived some of the interest taken in them more than sixty years ago, when Captain Basil Hall and Dr McLeod published their narratives of a visit to the principal island of the group, which was then but little known to navigators.

It was a fine spring morning of 1816, as Captain Hall describes it, when the men-of-war *Alceste* and *Lyra* lay off the western coast of Great Loo-choo. A rich extent of cultivated land was displayed to view, where a barren prospect only was expected. The vessels were anchored in front of a town, having a sort of line-wall along the water's edge, from which some boats soon put off. Without any symptoms of fear or hesitation, the boatmen came alongside the ships, kindly offering vegetables and fresh water, which were very acceptable. On being questioned by signs as to the proper anchorage, they pointed round the south-west end of the island. The vessels sailed in the direction indicated, carefully sounding and looking out as they advanced along shore, and at night anchored in deep water. Next day, they proceeded farther on their course, and about noon descried a considerable town, with a number of large junks at anchor in a commodious harbour. This was Napakiang, the principal seaport of the Loo-choo Islands, where the ships finally anchored. The astonished natives, who never had seen such large European vessels before, were perched in thousands on the surrounding rocks and heights, gazing with silent wonder on them as they entered the harbour; but not the slightest sign of displeasure or hostility was indicated by the multitude.

Immediately the *Alceste* was anchored, several boats came alongside containing officials, who wished to know what country the navigators belonged to, and the nature of their visit. By the assistance of the Chinese interpreter on board, satisfactory answers were made to these queries; including a statement that the frigate had encountered violent weather at sea, and had sprung a leak, obliging them to put in there to repair damages. Such, however, was not really the case; but to make the story feasible, the well was filled by turning the cock in the hold; and

the chain-pumps being set to work, threw out volumes of water on the main-deck, to the great amazement of the officials, who seemed to sympathise with their misfortunes. This ruse was considered necessary to prevent any serious alarm from the arrival of ships of such unusual appearance and force. Not only did the artifice succeed, but when the visitors returned on shore, they immediately put in requisition a number of carpenters, and people acquainted with the construction of their own vessels, in order to render what assistance they could in stopping the leak. When these men came on board with some rude tools, their services were civilly declined by the senior officer, on the ground that there were plenty of good carpenters on board; adding, that all they wanted was an asylum during the time of repair, with permission to take on board some fresh provisions and water, which they would most cheerfully pay for. An immediate supply was sent of bullocks, pigs, goats, fowls, eggs, and other articles, with abundance of sweet potatoes, fruits, vegetables, and even candles and firewood; those who brought them taking receipts to show they had been delivered; but the chief authorities who sent them, refused any payment whatever, even for repeated supplies during their stay in the island.

Unwilling to give cause for alarm or uneasiness to a people so well disposed, the Commodore gave orders for all to remain quietly on board until visited by some of the high officials. After a few days, a personage of apparently distinguished rank embarked in a barge surrounded by a large concourse of natives, and came on board in a dignified manner, when he was received with all due respect. He was a man about sixty years of age, with a venerable white beard, quite different in physiognomy from the Chinese, who have but scanty beards. His dress was a purple robe, with very loose sleeves, fastened round his waist by a sash of red silk, and white gaiters with sandals on his feet. His cap of dignity was twisted neatly into folds, and covered with a light purple-coloured silk. A numerous suite accompanied him; some were officials of inferior rank, and the others his personal attendants. After partaking of a handsome entertainment on board, he took leave, the Commodore promising to return the visit.

A friendly intercourse soon sprang up between the English naval officers and the Loo-choo chiefs, so that confidence took the place of timidity on the part of the officials. Instead of only a few officers and men from the ships being permitted to visit the shore at specified times, parties were allowed to land and look about the town and country as they chose, but always under the guidance of natives. Moreover, the garden of a temple was fitted up and placed at their disposal, as a sort of general arsenal for the warlike stores. The guns, shot, musketry, bayonets, and swords of the strangers were apparently objects of wonder to them. When, however, the chiefs observed

the effect of fowling-pieces in the hands of some officers in pursuit of game, they begged that the birds might not be killed, because the people were always delighted to see them flying about their houses and gardens; but if they wanted them to eat, an additional quantity of fowls would be sent on board.

While thus impressed with the happy political and social condition of the inhabitants, Captain Hall and Dr McLeod assure us that they were equally charmed with the situation of Great Loo-choo, as enjoying the most genial climate of the globe. Refreshed by the sea-breezes which, from its geographical position, blow over it at every period of the year, it is free from the extremes of heat and cold which oppress many other countries; whilst from the general configuration of the land being more adapted to the production of rivers and streamlets than of bogs or marshes, one source of disease in the warmer latitudes has no existence.

When the narratives of this visit were first published, they were thought to partake more of romance than reality. But as their truth was supported by the evidence of the officers and ships' crews of the two men-of-war, they could not be disputed. At the same time, several gentlemen, practically conversant with the history of China, in which Loo-choo is mentioned as a tributary state, doubted the flattering accounts of the apparently refined civilisation of the government and people. Moreover, although no weapons of war were seen by the English, a Chinese envoy named Chow-hwang, who was sent to report on Loo-choo, in the twenty-first year of the Emperor Kien loong, 1757 A.D., describes their military arms and other implements of war, also the mode of punishment.

Whatever may have been the previous condition of the people and their rulers, subsequent foreign visitors confirmed to a great extent the statements in the narratives of Hall and McLeod. The most important of these was a visit of the merchant ship *Morrison*, during the months of July and August 1837, with Mr S. W. Williams on board, an American missionary well versed in the Chinese language. He found that although the Loo-choo language differed entirely from the Chinese, yet many of the officials were sufficiently conversant with the written characters to be able to maintain communications.

Although the internal government and institutions of the islands are modelled after those of China, it was very evident that Japanese customs and influence obtain the supremacy. The common people around the principal towns and suburbs appeared to have a fair share of the comforts of life; and by their general devotion to agriculture were able to provide themselves with a good supply of necessaries, and to escape from those extremes of wealth and woe so strongly contrasted in China. Few or no beggars were seen; and when looking at a large crowd, the eye detected few diseased or crippled persons. Their stature seldom exceeded five feet, or five feet two inches; their limbs were small, and their whole frames indicated a people little used to hard work. Their general physiognomy, though possessing the

leading features of the Mongol race, differed from the Chinese and Japanese, and appeared more allied to the Koreans, especially in their having ample beards.

When the Americans on board the *Morrison* compared their observations with those of previous visitors to Loo-choo, they were led to infer that the novelty of foreign ships had worn off; and that the policy of the government was to depute officers for their reception, appointed for the business, to supply them with provisions, and induce them to depart as soon as possible. All attempts to remunerate them for supplies were declined; for it would be the same thing as buying and selling, and it was against the laws of the country to trade with foreigners. No doubt, this was a stipulation enforced by their Japanese masters, who held a monopoly of the external commerce.

Foreign vessels, both merchantmen and men-of-war, frequently visited the port of Napakiang after this, for the purpose of watering and taking in supplies of provisions, which proved a heavy tax upon so poor a country. In time, the authorities relinquished the custom of supplying them to traders gratuitously; while the captains of war-ships gave equivalent barter in the shape of presents. As no metallic currency was seen in circulation, visitors were at a loss to know how the people traded among themselves, unless through barter or some kind of paper currency. At length, Spanish and American dollars were exchanged for provisions, when it was ascertained that their value was well known. Among the foreigners who introduced these was a missionary named Bettelheim, a converted German Jew, who landed with his wife and family to form a Christian Mission, under the auspices of an English Association.

The next important visit of foreigners was that of Commodore Perry in 1854, with the United States' squadron, on its famous voyage to Japan. The members of this expedition saw more of Great Loo-choo and its inhabitants than any of those who preceded them. They verified the statements of the British officers as to the picture-like beauty of the shores, which recalled to mind the richest English scenery; but they did not altogether sustain the glowing accounts of the simplicity, friendliness, and contentment of the people, although these appeared to be naturally not unamiable. Either Captain Basil Hall was mistaken, or the national traits had changed since the time of his visit. 'He represents them,' says the Commodore, 'as without arms, ignorant even of money, docile, tractable, and honest, scrupulously obedient to their rulers; and their laws, and, in fact, as loving one another too well, willfully to harm or wrong each other. Many of the officers of the squadron went to the island, expecting to find these beautiful traits of character; but, gradually and painfully undeceived in many particulars, they were constrained to acknowledge that human nature in Loo-choo is very much the same as it is elsewhere. The system of government, of which secret espionage forms a distinguishing feature, must beget in the inferior classes cunning and falsehood; and these our officers certainly found. The Loo-chooans pretend ignorance of offensive weapons, and of such no open display is made by the people; but Dr Bettelheim says that he has seen firearms in their possession, though they seek to conceal

them from strangers, and they are doubtless by nature a pacific people. As to money, they know the value of gold and silver very well, and they traffic for the Chinese *cash*, of which from twelve to fourteen hundred are equivalent to the Spanish dollar. They are an eminently shrewd people, and proved themselves to be somewhat "smart" in the matter of exchange, when the disbursing officers of the squadron came to settle with them the value of the coins. They have, on the whole, many excellent natural traits; and their worst vices are probably the result, in a great measure, of the wretched system of government under which they live.'

As an industrial people, they have a limited external trade in merchandise for home consumption. Sugar forms the chief export; and grass-cloth is the common stuff for garments, though cotton fabrics are abundant, the materials being grown in the islands. Among the imports, tea and silk are the staple articles, but some of inferior kinds are of home produce. Two kinds of millet, sweet-potatoes, and rice, are the usual crops; besides which, the country affords all the common garden vegetables, melons, and many sorts of fruit. Seaweed is collected for manure, and agriculture is conducted on the same principles as in China, by hand-labour and irrigation. The fields are very small, separated from each other by foot-paths, and the seed is planted in rows. Indeed, the Lilliputian minuteness with which the country is subdivided is singular. Great Loo-choo contains about nine hundred square miles, being sixty long and fifteen broad, and contains thirty-five departments, with upwards of three hundred and fifty smaller districts; which makes the average size of a district about two and a half square miles. The estimated area of the whole group is about five thousand square miles; Mount Onnodake, rising ten hundred and eighty-eight feet, being the highest peak in the ranges that run through them, trending in a north-east direction. Various estimates have been made from time to time regarding the population, but the highest does not exceed one hundred thousand. When we consider that this number represents the inhabitants of but a small district among the multitudinous millions of China, or the lesser population of Japan, the insignificance of this Oriental kingdom will be apparent.

Loo-choo was annexed by the Japanese in April 1873, when a squadron of the newly formed Japanese navy was despatched from Yedo Bay, with a military detachment on board, and several high officials, commissioned by the Mikado's government to take possession of the isles, and annex them as a dependency of Japan. When the expedition arrived at Napakiang, and the members of the mission, with their military escort, proceeded to the royal residence at Shuey, and proclaimed the purport of their visit, the king and his functionaries were seized with consternation. Although an event of the kind had for some time threatened the destinies of their little island-state, yet they had all along been sanguine that it might be averted by diplomacy. Accordingly, a petition was drawn up, and forwarded by an Envoy and suite to the Japanese government, in which the petitioners pleaded their long service to the kingdoms of China and Japan conjointly as a reason why they should not now be constrained to serve

one of them only. 'It is not our wish,' said the petitioner, 'that we should serve two masters, but a sense of necessity compels us to do so. Our people are accustomed to say that as Great Japan is our father, and Great China our mother, we should reverently obey them both. Now, what the Japanese government commands is this, that we should serve only our father, and should forsake our mother. This causes us the deepest sorrow. When we were leaving the harbour of Napa, our king Shotai commanded us, saying that if we failed in our mission we would hope for no forgiveness from him, and must forfeit our lives. We are placed in such a strait that we can neither comply with the wishes of the Japanese government nor return home. There is but one road for us to travel, and that leads to death. When the bird is about to die, it sings a sorrowful note, and the stricken deer utters a plaintive sound. The sorrows of death are very near to us, and our prayer is but a mournful lamentation.'

Notwithstanding this pathetic appeal, and the consequences of offending the Peking government, the administration at Tokio resolved on deposing the king, and declaring Loo-choo no longer tributary to China; which resolution was at once carried into effect by the expeditionary force, without any resistance from the inhabitants of the islands. At the same time, no harsh measures were used towards them or the authorities; while the king was politely removed from his palace to one of the ships, and then conveyed to the capital of Japan, where he was invested with the rank of a Japanese Prince with a suitable income. His place at Shuey was filled by a governor, who has jurisdiction over all the islands, maintaining his dignity and power by a permanent military and naval force stationed in Great Loo-choo. After an examination into the effete institutions of the country, most of them were superseded by the reformed systems introduced into Japan after the European model. Among these was the new foreign calendar, which replaced the ancient Chinese system of calculating time.

After this, the whole of the islands scattered over the sea between the twentieth and thirtieth degrees of latitude were formally annexed. They number more than three hundred, and are divided into three groups, called Tshung-shan, Shan-nan, and Shan-pei, and these again into provinces, districts, and parishes. The governor and his establishment have their abode at Ewang, the former residence of the king at Shuey in the Tshung-shan group.

These changes were so well prepared and so expeditiously carried out, that they were known to the people in China and Japan only after they had been actually made. When the news reached Peking, great surprise, dejection, and dissatisfaction were shown among the supporters of the government. A few days earlier, a new Japanese ambassador had presented his credentials without taking advantage of the occasion to say anything about Loo-choo. The Chinese ambassador at Tokio questioned the Japanese government concerning the annexation; when the chief minister replied, that they were ready to prove at any time their right to the Loo-choo Islands, and that now having possession of them, they were determined not to give them up.

Japan is certain to retain possession until China

is able to drive her from the islands by force of arms, which at present she has neither the ships nor the means to accomplish. What may be the future of Loo-choo and its inhabitants, is matter of conjecture; but it is to be hoped the halcyon days of the Lilliputian kingdom and its people are not yet quite ended.

## THE TREASURE AT GRAN QUIVIRA.

### CHAPTER II.

SEVERAL days, a whole week, went by, and Gerald Elkley, although improving steadily, was still unable to bear his full weight upon the injured foot, and so limped slowly with the aid of a stick—'hobbled around,' José said. He had found the Mexican not only a skilful attendant, as had been predicted, but a very kind and attentive one; while José was quite won over by the young man's invariable courtesy and consideration when speaking to him. The Mexicans were unfairly dealt with, and harshly used, all through the Territory, faring as well, perhaps, in such remote and scanty settlements as Blue Creek, as anywhere; for at that place were no saloons, no quarrelling rowdies, no political disputes; and the Mexicans were there of great use. Nevertheless, Señorita Annie Tate was the only person who had ever been consistently kind to José, until Gerald came; and his manner had so delighted the Mexican, that he would doubtless have risked his life for him readily—for men did that with very slight incentive in New Mexico.

José was sometimes very confidential in his conversations, especially when speaking of the dwellers at Blue Creek; and at the close of one beautiful day, when he had taken Gerald's arm, and assisted him to a certain ledge, which, as it commanded a splendid panorama along the Creek, was a favourite spot with the young man, the Mexican began: 'Señor Elkley, don't you show them rolls of greenbacks that I saw to-day, to nobody here.'

'Well, I will not,' returned Gerald, 'if you advise me not to do so. But why do you say this now?'

'Because now is the right time,' said José, 'before you have done it. After that, it is too late.'

'He is right there,' muttered Gerald.

'Señor Sy Tate he very bad man,' continued José. 'You remember how he ask you if Scotch Andy know you had come on to Blue Creek? Well, if no one but the citizens had known of it, I think he kill you somehow that night—you have such a beautiful rifle.'

'Good heavens!' exclaimed the other; 'he would not surely murder me for the sake of a gun?'

'Señor Sy Tate has killed men for less than that. You sabe, he white Indian once,' José dropped his voice here, and looked warily round. 'He no dare live near Denver and around there. I hear this from old Pablo, the half-breed Apachó who come here. But Señor Sy much afraid of Señorita Annie, and she will take care no harm come. So will José. Ugh! I not afraid of Señor Sy Tate! Old Juanna the witch tell me one of us kill the other some day, and I often think it will be me kill him; I have much good

mind to.—But Señor Elkley, for all that, you no let him see all your dollars. You say you send to Santa Fé for more money soon. Señor Sy Tate he go mad to get all them greenbacks, and accident soon happen.

Gerald thanked the friendly Mexican; and resolved to take his counsel, so long as he was compelled to remain at the Creek.

'But what an awful set to be thrown amongst!' he thought, as he returned to the house. 'The girl and this Mexican are, to a certainty, truthful and honest; but never in my life did I see such a scoundrelly gathering as are the remainder. I hope I shall be able to travel so as to meet the others at the rendezvous.'

On entering the house, he found that supper—as the six o'clock meal was called—was ready; that his special seat was duly placed for him, rendered soft, and even luxurious, by buffalo robes and bearskins. Sy Tate was at the low stable-door, whence he had given a sullen nod of recognition, as he saw Elkley enter; while Annie was standing by the table within.

'I saw that you moved around first-rate, Mr Elkley,' she began; 'your foot seems better day by day.'

'Thanks to you and to José, it is. But I must give some credit to the healthful mountain air, I expect. This is indeed a lovely spot.'

'Yes; so strangers tell us,' returned the maiden; 'and they show how much they admire it by hurrying away at the first opportunity. You also seem anxious to do the same.'

'I have reason for wishing to leave soon,' replied Elkley; 'but I shall never forget Blue Creek, or the kindness I have met here. If I am spared, Miss Annie, I will infallibly come and see you again.'

The girl's colour rose a little at even this matter-of-course speech; for she was but little used to the conversation of handsome young men from down East.

'I should be ungrateful indeed, if I did not do so much,' continued Gerald; 'and you must give me a list of all the choice articles, especially books and engravings, that I shall bring up from Santa Fé.'

'Air you going Santy Fee way, then?' inquired Sy Tate, who just then entered the room.

'Yes; I have to meet some friends there shortly,' returned Elkley. 'They will let me know when they arrive at Kansas City; they intend to hunt across the plains from thence to Santa Fé.'

'Then I expect it's for you that a team has stopped below,' said Tate. 'I saw a man come this way with a packet; and here he is.'

As he finished, a man clad from head to foot in buckskin, with revolver on one hip, and a sheath-knife on the other, after the manner of New Mexicans, presented himself at the door, and stepped within, with the free-and-easy manner of his countrymen. 'Say!' he began; 'I guess this is Sy Tate's; and from what I have heard tell, you are Sy Tate.—And you, stranger, are Squire Elkley.'

'That is my name, certainly,' returned the young man.

'Then I have brought on this parcel for you from the mail-station,' continued the teamster. 'It was to have been given to Andy Macgregor;

but he had just taken a contract for freight to Denver, so he gave it to me.'

'Many thanks,' said Elkley, taking the offered packet. 'Will you tell me how much the charge is?'—

'It is paid for,' interrupted the teamster. 'Andy took a satchel up to the Ratons for my missis, so that's balanced.'

'But I should like to pay you for your trouble'—began Elkley; when the teamster cut him short: 'Keep your money, Squire, for them that wants it. I'm an American citizen and a Western man, that don't need no favours of you nor nobody. No offence, Squire. When I do work for you, you shall pay me for it; but this item I did for Scotch Andy, who has paid me. I ain't going to take your dollars, as if I was a loafer who wanted alms. No, sir-ree.—Good-evening;' and with that the independent teamster disappeared.

'It is as I expected,' said Gerald, addressing Annie, after glancing through his letters. 'My friends are now on their road to Santa Fé; and I must contrive to leave here in a day or two. I cannot walk through the cañon—that is evident. Do you think you could spare José and the wagon to take me as far as Three Waters City? I could buy a horse on reaching there.'

'Do you reckon on riding alone from Three Water to Santy Fee?' asked Tate, speaking in answer to the question, which had been directed to the girl.

'Yes,' replied Gerald. 'I have a good map, and find the stations lie pretty close to each other.'

'You will be robbed and murdered before you have travelled half your journey,' continued Tate. 'I know the road, and know the people who are on it. You must ride by the mail, if you want to ride with a sound skin. Maybe you won't be over-safe, even then.'

'I am sorry to hear you say so,' returned Gerald, 'as I had not believed that part of the road to be dangerous. We expected to find a look-out necessary after leaving Santa Fé. But we shall be a strong party.'

'Where air you going after you quit Santy Fee?' asked Sy. 'Do you mean to strike for Arizona, or Old Mexico, or air you going through the Indian Territory?'

'None of these,' said Elkley. 'We are going to explore Gran Quivira; we have valuable information'—

The sudden start of his three companions—for José sat at the table with them—startled him in turn, and he looked from one to the other in perplexity.

'Gran Quivira!' exclaimed Tate, in tones even harsher than usual; 'and what should you do at Gran Quivira?'

'What others have done, I suppose,' replied Gerald, who had recovered himself: 'scout for the buried treasure; but with a different result. We shall find it.'

'You air like most of the others have been,' said Tate, with a sneer he did not attempt to conceal; 'very certain you know all about it before you go; and like them, you will crawl home disappointed; if you don't lay your bones there, as many better men than you have done.'

'Mr Elkley!' exclaimed Annie, 'you surely do not propose to seek for the buried treasure at Gran Quivira? Do you not know that many parties

have set out to find them? None of them have had the least success; and many have been entirely cut off by Indian or Mexican skirmishers. I trust you will not go.'

'Gran Quivira's very dangerous place—there's no two ways about that,' said José. 'I have been there, and know every foot of ruin. Everywhere prospectors have dug, but never find gold; and no one know where to dig now. You might dig in one place just same as another.'

'José is right, so far as he goes,' resumed Tate. 'But there is another thing. The people in this Territory don't like strangers from the East rampaging and cavorting around to get their gold and silver fixins, and they are likely to show what they think.'

'That is so,' added José. 'There are others to be afraid of, Señor Elkley, beside Injuns and Mexicans. Don't you go, Señor.'

'At anyrate,' returned Gerald with a laugh, 'the treasures are as much mine, as they are the property of any citizen now living in New Mexico. I am much obliged for your warnings; but there will be nine good rifles in our party, besides the help we may hire; and I fancy that ten times our number of Indians would have had but a poor chance of storming our camp. Again; we shall arrange for fresh supplies of water, which has hitherto been the weak point of all prospecting parties. And then we have some special knowledge, which I think no other prospectors have possessed.'

'Indeed, Squire! And mought I ask what that is?' interposed Tate, who was evidently listening with the keenest interest.

'Certainly!' returned Elkley, as cheerfully as before; but glancing around, he saw the eyes of Annie and José bent upon him with no less interest than were Tate's—an interest which seemed almost breathless. A little surprised, and a little amused also, at this, he went on: 'We were in Texas a few months back; and while there, we rendered a slight service to an old fellow—a hundred years old, I should say he must have been, to judge from his looks—an Indian, or half-breed I should fancy. The service was slight enough on our part; but we happened to save the life of his only surviving great-grandchild, or something of the kind; and he took quite a liking to us in consequence. To make a short story of it, we told him we should travel in New Mexico, and had thought of going to Gran Quivira. He seemed a little disturbed on hearing this, as you, Mr Tate, also appear to be; but on the last night of our stay in his village, he told us a secret about the place.'

'And what was that?' interrupted Tate, who was listening with unabated interest.

'It was, that there was a smaller chapel, an outlying spot, attached to Gran Quivira, but lying a few miles off—that for fear of the troubles which actually came, the ornaments and plate had been removed there, and there buried. He gave us the landmarks necessary to identify the place.'

'Ay, and what may those landmarks be?' demanded Tate, in such ill-disguised calmness, that Gerald was again somewhat startled.

'I have not the chart with me,' he said, 'so doubt if I could tell you where the real position is; but

I must add in candour, Mr Tate, that I do not think I should feel at liberty to inform you, even if I had it.'

'If you had it!' echoed Tate. 'I calculate there's no doubt about that.'

'There is none, Mr Tate,' returned Gerald, with something of sternness in his own voice. 'I have it not, and have told you so.'

The conversation was kept up for some time, the subject apparently having the greatest attraction for both Tate and José.

As many of our readers have heard, doubtless, of Gran Quivira and its buried treasures, it will suffice to say briefly that at this place, which is situated in Socorro County, New Mexico, lying about ninety miles from Santa Fé, or one hundred and twenty from the border of Old Mexico, there was once a rich church and monastery. When the Spaniards left Mexico, the people rose in most districts, and slaughtered or drove out the monks, as fellow-countrymen with those from whom they had suffered so much. (New Mexico—Nueva Mejico—was a part of Mexico in those days, the reader will remember.) At Gran Quivira, the monks were not unpopular, as they had been kind to the people around them; and as they were charitable and skilful as doctors, the populace spared them; but, assembling in vast numbers, contented themselves with utterly destroying the buildings, allowing the brethren to escape to the city of Mexico. The monks left accordingly, as no better might be done; but as they were not permitted to take anything with them, they buried within the church the massive plate, of which they had an immense quantity, then repaired to Mexico, and there deposited a record, to be used in better times, which explained that they had concealed ten thousand pounds in weight, of gold and silver plate and ornaments.

The church was utterly destroyed and razed; the better times never came to allow the return of the monks; and in the lapse of time, the springs or streams which fertilised Gran Quivira found other channels, so that the district became arid, and unfit for the support of human beings, or even cattle. This feature had had great influence in checking the search for these treasures, the existence of which was as absolutely believed in as in the existence of Mexico itself.

Gerald was a resolute believer in this concealed wealth; and Tate, although he ridiculed and sneered at almost every proof the young man offered, was yet too acutely interested to hide his real feelings on the matter, sullen and guarded as he was on ordinary occasions. It was plain he believed in it also; and Gerald suspected him of a desire to pick a quarrel on the subject, so heated and insulting did he grow. Elkley, although a young man, was yet too old a campaigner to play his opponent's game when exposed in so glaring a manner, so became more guarded as Tate waxed loud or sarcastic. Whether he at last saw this, or of his own accord altered his tone, Gerald could not decide; but after a while, Tate half muttered some contemptuous rejoinder, and left the room abruptly, calling José to accompany him to the stable.

Directly he had gone, Annie, who had latterly

been silent, now spoke. 'Mr Elkley,' said the girl with great impressiveness, 'I think it will indeed be well for you to leave as soon as possible. I will arrange for José to drive you down the Creek to-morrow, and shall be glad to know you are at Three Waters City, and quite away from here.'

'It would be a hollow pretence, indeed, if I feigned to understand that I have in some way caused you—and Mr Tate also—great uneasiness by speaking of my plans to-night,' returned Gerald. 'You must surely see that I cannot guess why this is so, and should be glad to ask'—

'Do not ask,' interposed the girl decisively. 'I suppose that all over the world, in every home, there are some things which are better not inquired into; and this may be one of them. So long as you do not think me unkind in thus hurrying you away'—

'Think you unkind!' exclaimed Gerald. 'The only unkindness you could be guilty of would be to suspect me of such a feeling. Even if I could forget that you probably saved my life'—

'Oh, do not refer to that!' interrupted Annie, almost pettishly. 'I should have done such a trilling act as that for any one else, even'— Her heightened colour and her vexed tone made it difficult for Elkley to pursue the conversation. While he was thinking how to frame his words, the voices of José and Tate were heard without. 'Señor Elkley,' whispered the girl hurriedly—she, as did most of those around her, occasionally fell into the Spanish mode of address—'tell José you wish him to be with you early in the morning and that he had better not go to his shanty to-night.' The door here creaked on its hinges, and she ceased; but her back being towards those who entered, she hid her finger on her lip, with a warning glance to Elkley.

Tate appeared to have lost his ill-humour, and was now unusually cheerful, even facetious, after his manner; but the conversation of the evening, and above all the warning words of his fair hostess, had determined the guest to render his stay there as short as possible, and had caused him, indeed, to feel somewhat nervous and uneasy.

At once, then, he conveyed to the Mexican his wish that he should be with him early in the morning, as he intended to leave the Creek next day, and would like to get everything ready betimes. As he said this, Tate turned quickly upon him; and although he spoke not, the expression on his features told how instantly his suspicious mind had taken the alarm.

'Bueno, Señor,' assented José. 'I will sleep outside your room, as I did before, so I can call you at any time.'

'You propose leaving the Creek to-morrow, then?' said Tate; 'and how do you intend to travel?'

'Miss Annie has been good enough to promise me the wagon,' replied Elkley. 'José will drive me down.'

'Oh! I see you have settled it all among yourselves,' retorted Tate bitterly. 'A man ain't of no consequence in his own house. I have nothing to do with it, of course.'

'Nothing at all, Sy Tate,' said Annie, who had never addressed him in Gerald's hearing as 'grandfather' or by any family appellation. 'It is my

business, and I have settled it.' As she spoke thus, she drew herself up, and looked straight at the old man, with an air too defiant to be mistaken.

Sy could never return this glance, which Gerald had seen ere now; so grumbling moodily, he turned away. 'There's no need for José to sleep on the premises, anyhow,' he continued, after a pause. 'We don't want no more strangers than we've got; there's been one too many here for some time.'

'That is settled also,' returned the girl. 'I have laid the buffalo robes for José's bed outside Mr Elkley's room.'

It was only a momentary glance with which Tate ventured in reply to this, but it was the most vindictive the young man had ever encountered.

Something connected with this bitter look had so preyed on his mind, that he was not surprised to hear José whisper, as he bade the Mexican 'good-night' at his room door: 'Señor Elkley, it's a dog-garned good thing you thought of telling me sleep here *esta noche* [to-night]. Sy Tate he in pretty ugly temper just now; but he is much afraid of Señorita Annie; and he shall be more afraid of me before I finish with him. *Buenos noches* [good-night], Señor.'

#### PAPER-MAKING MATERIALS.

THAT 'the consumption of paper is the measure of a people's culture,' is now an admitted truism; it is therefore cause for much congratulation that the manufacture and consumption of this indispensable article are considerably increasing in this country. Statistics prove that the average quantity used per head of population in Great Britain is greater than in any other country; and it has always been so. The natural result of this is that the supply of raw material necessary to manufacture the increasing quantity of paper has become almost inadequate for present demand, and we cannot much longer rely on our old resources only. Indeed, the ancient staple material 'rags,' although still theoretically supposed to be the correct thing, actually enters very little, when at all, into the composition of modern paper; for the very simple reason that it would be impossible to obtain sufficient rags now to give the public the quantity of paper required—to say nothing of price. Rags have thus been, perforce, greatly superseded by raw fibres and waste materials; yet these huge supplementary supplies must soon fail to maintain consumption at necessary reasonable rates and quantity; for probably paper was never so cheap, or such good value, as at the present time. It is refreshing to know that the pressing requirements of the paper-trade are now almost universally recognised as of public importance, and numerous 'new' fibres, &c., are constantly being suggested from all sources. Considering, however, how often we read of 'new' materials introduced as suitable for the manufacture of paper, the fact remains that comparatively few articles are actually offered, or procurable in the market yet. For the manufacture of good white paper, the only raw fibres available by English paper-makers may be said to be esparto grass, straw, and wood; to these materials must be added rags, of course, and also the waste

products from the treatment of flax, jute, cotton, and other similar industries.

The object of these few remarks is to give some practical information on the subject of paper-making, sufficient to elucidate the qualifications necessary in a suitable raw material, and thus probably save much valuable time and misdirected energy, that might be wasted through ignorance of the treatment which all raw fibres must undergo in the process of paper-making. Before we come to the actual mechanical or chemical manipulation, it must be carefully considered whether the production of any proposed raw material can be made a commercial success agriculturally—a primary necessity. It must be noted that all raw fibres contain a large proportion of natural moisture, and the yield of pure fibre, or cellulose—the only substance useful and required for paper-making—is calculated on the dry weight of material. The yield of paper from known raw fibres varies from ten to sixty per cent. of the dry material—a very wide margin to speculate on in the superficial choice of a 'new' fibre or plant suitable for making paper. The question of production is thus, first, seriously affected by the yield of dry material per acre; then by the cost of cultivation and collection; and again, by the packing and transshipment charges in and from, probably, a distant foreign country. These, on bulky materials such as raw fibres, are no insignificant items.

As a matter of fact, paper can be, and has been made from almost every likely and unlikely raw material and waste product in the civilised and uncivilised world. Of course, the quality of paper produced has varied; good, bad, or indifferent, according to the suitability of the article under treatment; also the first cost, waste, and expense of treatment have varied in like manner, if not in similar proportions. Assuming that from the producer's, or agricultural, point of view any supposed fibre can be delivered in this country so as to compete successfully with present supplies merely in regard to actual weight and price—then irrespective of any mere advantage of quantity, there is the all-important consideration of quality involved in the matter. It is imperative that the resulting absolute yield of pure fibre, or cellulose, should be worth the cost of its necessary future mechanical and chemical treatment. Most, if not all raw fibres or plants contain a variable proportion of gluten, silica, and colouring matter—that is, every raw fibre contains one or more of such imperfections. These ingredients in the raw material are not only useless but injurious to the paper-manufacturer, and, moreover, are only dissolved and separated at great expense. It is under this particular test that practical failure is the result of most of the before-named suggested 'new' fibrous materials, after valuation by some so-called 'experiment' conducted on theory alone; and, as already stated, the quantity of extraneous or useless matter varies from forty to ninety per cent. in known specimens of raw fibre.

The first process adopted in the manufacture of good white paper is the sorting of material; and it is desirable, therefore—to save expense, or in other words increase value—that the supply should be uniform in quality. The next process is to thoroughly clean, or dust, the fibres; and this may

not only be expensive, but almost impossible in some cases, when material has been known to be so sandy, muddy, or gritty as to defy all cleansing to fit it for clean, white paper. If the raw article is worth sorting and cleaning, it must then be submitted to a more or less severe and lengthened boiling in caustic soda or other suitable chemicals, to dissolve and loosen the silica and gluten, and thus also free and discharge all excess of colouring matter. It must then be thoroughly washed, and freed from all remaining impurities and from the soda or other chemicals. The next point is that it shall not require too severe bleaching—that is, that the strength, quality, and yield of fibre shall not be destroyed or injured in attaining the necessary white colour. It is a well-known fact that the chemical effect of bleaching, by chloride of lime or other means, is far more destructive than any boiling process. It is also found that some fibres actually become rotted before they can be bleached perfectly white by present known means. Jute may be given as an instance where excessive bleaching alone is effective in producing good colour.

Granted that the resulting quality and yield of paper are worth the cost, labour, and chemicals expended on it, it is yet absolutely desirable that sufficiently abundant quantity, of uniform quality, may be forthcoming on demand, and at reasonable price, in order to compete successfully with present supplies. For instance, the quantity of esparto grass alone now consumed by paper-makers in this country is more than two hundred thousand tons annually; and there are millions of acres still under cultivation to maintain supplies.

The conversion of bagasse into paper stock at home is said to be attracting considerable attention in Louisiana. The fibre produced from it by a new process, when tested in the north and west, was declared to be extremely promising. The bleaching process appears at present to be the chief difficulty; but this, it is thought, can easily be overcome, and the fibre brought to the necessary degree of whiteness. By converting the bagasse into fibre at the plantations, three-fourths of the transportation charges will be saved. We are told Louisiana produces two hundred thousand hogsheds of sugar a year; and the cane for each hogshed will yield one ton of paper fibre.

It is reported that from the palmetto of Florida and other Southern States has been manufactured a parchment said to be as strong and pliable as that made from skins, while possessing the merit of being smoother. The parchment can be washed, rubbed, and handled just like cloth; and the writing, we are assured, will not be effaced. It may be added, that as much as sixty per cent. of the weight of the palmetto can be utilised for that purpose.

Thus, it will be seen that, however necessary it is for suitable paper-making material to be soon largely augmented in supply, yet the requirements of the manufacture and market necessitate special qualifications, to be found in few plants or countries, so far as our present experience or knowledge goes. The constant fluctuations in the market prices of our present huge supplies of raw material, consequent on the variation of supply and demand, occasionally place their value too

high for profitable consumption. He will undoubtedly be a public benefactor who can lead the way to new materials, or processes, whereby paper may be cheapened and more abundantly used.

## MY TROUBLES IN RUSSIA.

### TROUBLE THE THIRD.

BESIDES the German pastor, there are with me in the carriage, his wife and a German spinster; and we three become very friendly over the recital of my calamities. Many are the tales of fraudulent officials, of bribery and chicanery, which pass from mouth to mouth. The time passes so quickly and pleasantly, that I am surprised when we slacken speed, and my fellow-passengers collect their belongings. The pastor and his wife do not proceed to Dorpat; but the spinster, as she informs me, is going there to visit friends; so we unprotected females determine to keep together. We take a considerable time to gather up our scattered effects; for the spinster has handboxes, several baskets and bundles, which I hand to her out of the carriage. I wonder how she managed before she met me, for we are both laden breast-high as we enter the station-house. Here we are seen by the pastor, who is drinking tea at the refreshment counter. He leaves his cup, and comes hastily towards us. 'Ladies, I would advise you to hasten, or you will lose your chance of seats in the omnibus which runs between the station and the boat. If you do not succeed in catching it, I fear you cannot get on to Dorpat to-day; the boat waits for no one.'

The spinster at once drops several parcels, and loses the immediate possession of her mental faculties. 'Where!—Which!—What?' she gasps.

The pastor has picked up the scattered parcels, and strides to the door. 'This way!' he says. 'You may catch it yet. They have carried your luggage through; it will be outside.'

There stand our boxes, and also the omnibus, but crammed full of sweltering mortals; some standing with stooping heads, some sitting, huddled together, but all triumphant.

'I must go with this bus!' screams the spinster frantically, and rushing to the step.

The conductor waves her off. 'Cannot—too late—no room!' he cries. The driver cracks his whip, and the omnibus moves away in a cloud of choking white dust. The spinster looks wildly after it, and runs a few steps; then a bundle falls, and she is herself again, and relinquishes the pursuit. I stand looking on stonily, with a feeling almost of indifference. I am beginning to be hardened to misfortune and injured to waiting. My cheeks burn a little, but it is the heat of the sun.

The pastor speaks cheerily. 'Well, it is a pity you have lost it; but you must just make the best of it. You will get on to Dorpat on Monday. It only means a couple of nights at an hotel.'

'All Sunday! To spend all Sunday in a place like Plescow!' exclaims the spinster. 'And the expense too! Oh, to live in such a country!' She says a great deal more; and I agree to everything, but think of my ten roubles with considerable misgiving. The pastor, meanwhile, is looking about for a droschke for us, and is grumbling at the bad management which provides such scanty

means of locomotion to travellers. There is, at present, not one to be obtained, and the railway station is more than a mile from the town. Other passengers come from their tea-drinking and look anxiously down the long straight road; but they are inhabitants of Plescow, and seem to know what to expect. They saunter back into the waiting-room, or pile up their effects outside the station, to be in readiness.

'I should recommend you to have a cup of tea or coffee,' remarks the pastor. 'You have no hurry; and must just wait until some of those lazy dogs turn up with their droschkas. They will come in shoals when they see the omnibus enter the town.'

So we take his advice, and take our time over it, till we hear the sound of wheels on the gravel outside. The spinster of course becomes frantic again, for fear we may lose this chance also, and rushes to the door, followed, more sedately, by the pastor and myself.

'Do not excite yourself, my dear lady,' he says; 'there will be plenty of them, no fear.'

And sure enough, there they come in long file, driving furiously to outstrip each other, as they gesticulate and shout to their little rough, hardy horses. They are principally Jews, so baggling prevails for some minutes. Our share of it is kindly undertaken by the pastor; and at last we are mounted on two high-wheeled shaky vehicles, the spinster in the front, smothered in her *Handy-pack* (hand-luggage), to which she clings feverishly; and I—well, how that enterprising Jew driver managed to get to Plescow with my big box on his narrow perch beside him, will remain a mystery to me through life. I only know that extreme agitation prevents me from feeling that the skin is being slowly grated off my shins by the edge of my small box, which is wedged against them, and that we do eventually draw up before the door of the principal hotel, and that it—the big box—did not fall with a crash to the ground and burst, scattering my wardrobe to the four winds.

The hotel, kept by one Meyer, is over a baker's shop. We are shown into a large bare room, with yellow painted floor, and two high, shadowless windows looking on to the street. A narrow strip of the room is partitioned off by a screen, behind which are two very small musty-looking beds, two slop-basins and milk-jugs, which I afterwards discover to be intended for ablutionary purposes, and two chairs. An atmosphere of stale tobacco-smoke prevails, and the general effect is depressing. The spinster thinks otherwise; she observes on the size and airiness of the room, becomes quite chirpy and cheery over her toilet, and washes her face energetically in one of the slop-basins, which teaches me its use. After a time, I grow restless, and propose a walk about the town.

'Oh, my dear *Mädchen*,' she replies, 'who would think of walking in Plescow! There is nothing to see here.'

'But,' I entreat, 'I would like to go; it is all new to me.'

But she is not to be persuaded; so I go alone. She is right. Plescow possesses few beauties; yet the novelty of everything pleases me. I wander down the principal street, and stare up at the white-washed square houses, and into the small, scantily furnished shop-windows, where I see

nothing worth looking at. But a Russian priest who passes me, with his long waving hair, ample silk gown, and high cap, excites my interest. I stop in front of a Russian church, with light green roof and white walls, and wonder who was the architect. The massive, clumsy tower leans all to one side. The door is open, and I peep in. A gentleman, who is standing by, invites me by a sign to enter, and I do so. Here, at least, is attraction. I can scarcely see at first for the blaze of tinsel and colour; and long I gaze at the weird, brown faces of saints, which look out at me from their dazzling gilt haloes and gorgeous draperies. In front of me are golden folding-doors, closely shut; and a trellis through which I catch glimpses of greater splendour. Above me is a pale blue dome, studded with large gilt stars. It is all so strange and fantastic, that it is only when the woman who has been dusting the church touches my arm and says something, pointing to the door, that I awake to the fact that it is getting late, and she wants to lock up. So I go back to the hotel, still awed by what I have seen, and burst upon the spinster with many questions and exclamations.

Then we have supper, which is not bad. The bread is excellent, and made up into fanciful shapes, which please my youthful imagination. But my enjoyment is marred by the dense vapours of the apartment. Matters have not improved during my absence; tobacco has been coming up through the floor in clouds, and is still doing so. And oh, my readers, have you any knowledge of the properties of 'Karria Yaak'? Have you ever received one whiff of it into your nostrils? If you have not, you cannot sympathise, nor can I describe. It is a thing to be smelt, not described. There is, moreover, a scraping of fiddles, a shuffling of feet, and a confused din below, which grows and increases as the hours wear on. The waiter invites 'Fraulein'—meaning me—with a smile to join the ball, which he informs us is going on downstairs in the salon. The spinster throws up her hands; but she need be under no apprehension. 'Fraulein' feels no disposition to join the rabble rout, who would seem to dance with noxious tobacco-pipes in their mouths. At what appears to me an unreasonably early hour, the spinster proposes retiring to rest; and as she complains of fatigue and a desire to sleep, I have no alternative but to lay my unwilling head upon my dirty pillow, after first spreading a clean handkerchief over its sullied purity. Our candles are snuffed out; but, alas, 'jocund day' does not 'stand tip-toe on the misty mountain-top.' I wish she did! In vain I toss and turn, making the wooden bedstead creak and groan dimly. The spinster snores—happy spinster! The fiddles squeak; the tobacco-smoke rises around me; the din increases. I feel deeply melancholy. I cannot describe the miseries of that night and that bed. Before I have fallen asleep, I am glad to desert it—for, to my horror, I find it is being invaded! Putting on my clothes, I resolve to sit up—much to the annoyance of the spinster, who has not apparently the objections to a populated bed that I have. To have her night's rest disturbed in this way is hard. She is sure there is no vermin; it is all my own imagination. A strange thing that she is unmolested. She hopes I do not intend burning a light all night?

'No,' I sorrowfully reply; 'I will sit in the dark, and be quite still.'

I draw a chair to the table, blow out the candle, spread out my arms before me, and rest my aching head upon them. The leaden minutes creep on, and I listen in semi-stupefaction to the din below; then, I believe, from sheer exhaustion I fall into a doze, and dream many uncomfortable things, out of which I start at intervals. Suddenly, whether sleeping or waking, I become conscious of a renewed sensation. I raise my head, and my blood curdles. Something is slowly crawling over the back of my hand! I forget the spinster's anger. I lose all self-command, and shaking my hand wildly, I utter a scream of horror. I hear the complaining voice of the spinster again; but I am desperate. I grope for and grasp the match-box, strike a light, and look fearfully around me. There the thing is—and another, and another on the table and floor! The room is swarming with black beetles from the bakery down-stairs!

Now, if there is a living thing I abhor, it is a cockroach. I love mice, and could make pets of spiders; but at sight of a bloated, crawling cockroach my flesh quivers. And here are thousands! I shake myself convulsively and groan.

'I think, Fraulein, you might show some little consideration for others,' I hear the spinster say in a deeply injured tone.

'It's no use—I cannot bear it,' I cry. 'This is worse than the Black Hole of Calcutta. I would rather be in a vault with dead bodies all night' [borrowing the idea from the unparalleled sufferings of Sindbad the Sailor], 'or—or anything horrible, than be in this place!'

The spinster raves on, wobbling her night-cap frills at me; but I heed her not. I can bear no more, and lift up my voice and weep. After this, I obstinately refuse to put out the candle—the light scares away my foes—and retire to the far window-niche, gather myself together with my feet up, and wait, like a veritable Patience on a monument, for the dawn. I watch the flutter of her pearly skirts over the opposite chimneys, and catch her first rosy blush with fresh amazement at her mysterious beauty. The fiddles have stopped at last, the doors have ceased to slam, and a Sabbath calm reigns within and without. My weary head falls back, and I slumber sweetly in the face of the rising sun.

The spinster is stirring when I awake. Confused and dazzled with the full light, it is some moments before I can collect my scattered wits; but such is the elasticity of youth, that after wetting my hands and face in my slop-basin, and laughing at the wry face which the crazy-looking glass reflects back to me, I feel as fresh as a daisy and ready for anything. I have a burning desire to go to the service in the Russian church; but herein I meet with opposition. The spinster is scandalised at the suggestion; and after breakfast, I am walking sedately with the spinster at my side, to the Lutheran church. I find it a dreary business. The slow, drawn-out hymns, so unlike our more lively church music, seem to me to savour of funereal music. Of the long sermon, I understand nothing; and I am glad when we can go forth once more into the bright sunlight.

At dinner, the waiter informs us that the band will play to-day in the Tivoli Garden. My heart gives a bound; but my English prejudice quickly

repels the contemplation of such wickedness. To my surprise, however, when I have settled down at the window some time later to watch the people pass, the spinster herself suggests a walk in that direction; and, I blush to acknowledge it, I respond forthwith. So we go; and I hear a Russian provincial military band, to which I listen with bated breath as I try to follow the wraith of a tune which now and again struggles through the din of the big drum, to be speedily smothered by rebellious instruments. Yet, withal, I enjoy myself under the lime-trees of that Tivoli Garden, though it looks more like a poor neglected demesne than a pleasure-ground. Flowers there are none, and the grass is trampled and patchy; but there are the officers with trailing swords; there are Russians, Poles, Letts, and Estonians in their characteristic dresses. I could sit and watch till darkness fell; but the spinster has had enough of dissipation, and in an hour or two we turn our steps hotel-wards.

Another night with the cockroaches; but I am prepared, and that is half the battle. I persistently decline to go to bed, and refuse to be a single instant without a light. The spinster may grumble; in all other matters I knock under, but here I am firm. I again mount the window-niche, in which spot alone I feel safe; and with a rug for my pillow, I doze and start and slip into painful attitudes, until my last night in Plescow is of the past. I am up with the lark in the morning, and am ready to start for the boat, hours too soon. When at last our luggage is packed and ready to be borne away, and our bill is paid, which is moderate beyond all expectation—the one relieving feature of the Plescow hotels—the spinster shows the practical greatness of her German nature; she opens the jaws of a carpet-bag and deliberately empties the contents of the sugar-basin into it; then she possesses herself of the candle-ends, and drops them also in amongst the sugar-lumps. 'It would be a shame to leave them,' she explains. 'We have paid for them. Will you take the half?'

I decline with thanks.

In another hour we are actually in the boat, Plescow is left behind, and we are on our way to Dorpat; my fare is paid, and I am the happy possessor of half a rouble!

## UNCOMMERCIAL TRAVELLERS.

OF the wanderings and ways of the restless rovers known under the common title of 'tramps,' an interesting volume might be written. At the same time, it is clear that unless such a work were autobiographical, or by 'One of Them,' its value as a reliable record could not be considerable. An amateur attempting such a task, however largely endowed with the faculty of imagination, would have to encounter no end of difficulty; and in the result, his work would be full of flaws, when looked at with the eyes of the 'knowing ones.' It is so with all work requiring special knowledge. The writer of the present paper is reluctantly obliged to admit that he is no better off for information on the subject of tramps than the world at large—that is to say, so far as personal knowledge extends. However, through the kindness of a tramp of long profes-

sional experience and undoubted veracity, he is enabled to draw up an authentic general sketch of the daily life of one of the fraternity.

It would appear that the tramp army regularly draws its recruits from almost every class of society, and that on any day of the year may be found on the road as uncommercial travellers, decayed doctors, even clergymen who once wore the gown, attorneys, linguists, actors, verse-writers, printers, quacks, farriers, spotmen, pugilists, workers of witchcraft, fortune-tellers, and the various numerous nondescripts which go to complete the motley crew.

The typical tramp is undoubtedly a lazy, hulking fellow, who positively won't work, rejoices in the existence of the poorhouse, and does all in his power to diminish the national wealth. He is not above picking up a few fowls, when, to cover the theft, there is a fox-cover in the neighbourhood; and he is not unfrequently 'wanted' in connection with more ambitious spoils of brigandage. But then there is another well-marked specimen of the genus vagrant to be met with in men who, though once holding good and reputable positions, have yet, either from being consumed with the fire of unrest, or from a too obedient submission to their own passions, made the facile descent of the social ladder, to find themselves, when on the ground, almost as helpless as the day they were born. In order effectually to hide their heads from the past and its despair-compelling memories, these outcasts in many cases forthwith enlist into the army of tramps; and even when purged by suffering and privation, and oftentimes by sincere repentance, they rarely care to return to their earlier and happier haunts. Many of them despair, and mindless of 'the canon 'gainst self-slaughter,' eventually call in the knife or the rope to carry them to the bourne of unreturning travellers. Others, of sterner stuff, and possessing, so to speak, that staying power imparted by a cynical philosophy, adapt themselves to circumstances, and ultimately, strange as it will appear, become the very cream of vagabond society.

The tramp of this latter type can travel from Berwick-on-Tweed to Truro without paying a reckoning, save for the miscellaneous pots of liquor which he imbibes at the road-side inns. He is a thorough master of all the wiles of his craft, and can live well where a less resourceful man would indubitably starve. Aided by a good address and respectful though not obsequious manner, he can assume at will all the airs of a gentleman in distress; and as people's sympathies are more readily got at when they think it is fallen fortune that supplicates, our hero, as a rule, does not fare badly. He has invariably a melancholy tale of woe at the tip of his tongue, to soften the hearts of the credulous; and as his demeanour more than supports the presumption of gentility, he on the whole makes a good thing out of his representations. When he gains admittance to a household where there are children, he freely uses such expressions as 'What a beautiful baby!' 'What a magnificent boy!' 'What a sweet little girl!' and perhaps a tear wells up, and a faintly murmured, 'I had them myself once.' Such arts, if properly put in play, are never lost on loving mothers; and our hero is the very man who knows that.

It is in villages and peaceful hamlets, by meadows sweet, that the tramp most enjoys himself. In towns great or small, these troublesome officials the policemen, who are never to be seen in a real emergency, are constantly about, ready to pick up a poor fellow who asks for a crust, for the very good reason that he is hungry, and has not the wherewithal to satisfy the baker. But in pastoral little places far from the taint and turmoil of towns, where Order bears her constant reign, the houseless wanderer is asked few questions. Here, at least, he can count on the wholesome meal and the clean shake-down from the housewife, who bestows her charity with the purest intentions, and without much regard to the character of the recipient.

On entering the town, however, an entirely different set of circumstances prevail. The lynx-eyed custodian of the law looks upon the tramp as among the most legitimate of his victims. But the tramp is often one too many for our friend in the helmet. He has a confederate who gathers the coppers, the crusts, and the fragmentary beef, at the back-door, while the policeman is vainly hoping that the 'cove' he has his eye on may knock at the front. Monsieur Tramp will of course do nothing of the kind; and that is a piece of rectitude which a policeman finds it hard to forgive. But if the tramp is so hopelessly unprofessional as to allow himself to be caught offending against the laws appertaining to vagrancy, woe betide him! He is hauled before the justice, and charged with the heinous offence of having been found asking for a bit of bread. The irate gentleman on the bench probably begins as follows: 'Why did you ask for bread, sir?'

'Because I was hungry, sir.'

'And how came you to be hungry, sir? Answer me that at once.'

'Because I could not help it, sir.'

'You have the workhouse to go to.'

'I was going there when the officer arrested me, sir. I was fainting with hunger.'

'How do I know you were going there, or that you were fainting from hunger?'—(To the clerk of the court)—'Is there anything known against him?'

*Clerk.* Nothing, Your Worship.

*Magistrate.* I fear you are a bad character.—Look at his hands, and see if he has been working lately.

*Policeman.* He has artificial blisters made on his hands by working through them a heavy stick, so as to make it appear he has been working.

*Magistrate.* Month—hard labour. Three, next time.

As a matter of fact, the hand-hardening process is a well-known ruse for blinding justice by the vagabond gentry. But it is, after all, on workhouse authorities that they bring their highest ingenuity to bear. A man who has more than twopence in his pocket, the law says, is not qualified for admittance to the casual ward. The 'cute un knows by bitter experience, that if anything over the statutory twopence is found in his possession, he will be deposited in the nearest police station as a rogue and a vagabond. He accordingly, before presenting himself as a casual, proceeds to bury, at a spot which will bear his own private mark,

any surplus beyond the capital account of twopence which he may chance to have.

As a rule, tramps do not love soap and water; and therefore many of them regard the regulation bath which they receive on entering 'the house,' with much the same feelings that a child regards a dose of physic. The sleeping apartments provided for the vagabonds are not a credit to the country. One large shed independent of subdivisions, and almost entirely above considerations of decency, with raised shake-downs as near to one another as space will permit, is the casual ward of a large percentage of the workhouses of the country. In winter-time, there is always the fiercest competition for a good position at the fire; and not unfrequently, regular hand-to-hand fights take place for points of vantage. The personal exploits and experiences retailed round these same fires would in some instances appear to be readings from the pages of some thrilling fictionist, rather than recitals of what are, in the main, facts. It is with extreme difficulty that even the semblance of order is maintained in the casual ward, and the license of tongue permitted therein is something astonishing. So vigorously are conversation, jest, and ribaldry kept up during the night, that sleep is all but out of the question; but towards morning, as the hour approaches when the tramp must do his allotted portion of manual labour before breakfast, there is a visible depression of spirits on all sides. More tramps come into the 'house' on Saturday than on any other day, for the simple reason, that there is no work on Sunday. If the tramp returns three consecutive nights to the same workhouse, he will be looked upon as legally a vagabond, and dealt with accordingly. But few save beginners in the profession drop into this pit, or into any similar ones, when the laws, statutes, and traditions of vagabondage come fully to their knowledge, and are practised by them with due regard to precedent and the rulings of authority.

#### D A Y D A W N.

Dawning and bright, from out the misty East  
The Morn' comes, usher'd in by joy-bells pealed  
From each sky-hunting lark, each woodland bird.  
The happy Earth is clothed anew, afar  
In garb so fair, so mystically woven  
Of many-tinted grasses, 'broiler'd o'er  
With flowers a-drooping 'neath the heavy dew.  
Deep in the pinewood wakes a little wind,  
Wooes from the primrose cups of perfum'd gold  
Their hidden breath—then dies away, to leave  
A lingering wave of fragrance all around;  
While new-blown violets trembling, open their eyes  
In wonder at the beauty of the world.  
The glowing purple of a sun-kiss'd hill,  
Uprising like a link 'twixt earth and sky,  
A cascade flashing o'er a moss-clad stone,  
Sunbeams and shadows mingling dreamily:  
All, all combine to make one perfect Whole!

Ah, lonely heart, a-weary of thy care,  
Some time will dawn for thee a cloudless Morn,  
More bright because of shadows in the Past;  
For Joy is born of Sorrow, even as Spring  
Steals from the arms of Winter, and the Day  
From darkest Night emerges, purified.

## THE HUMAN PERIOD IN GEOLOGY.

ALTHOUGH we are apt to lose sight of the importance of our own species in the immensely wider study of the universe, as well as to undervalue the influence of man in comparison with those silent but mighty forces by whose agency our earth has been sculptured into its present form; yet all must agree with the Italian geologist Stoppani that man makes a distinct geological period, and that his creation is the introduction of a new force, previously unknown in nature. The power of intelligence in overcoming the influence of external circumstances is exemplified in the history of every nation; so that some historians have thought it necessary to preface the history of a people with a description of the geological features of the country in which it has sprung up. But when Cuvier said that the habits and even the thoughts of a people depend upon the nature of the soil which it inhabits, he scarcely made enough allowance for the power of mind to combat the external forces of matter, nor for that capability, which man alone of the higher animals possesses, of adaptation to the most diverse circumstances.

To one reading the recently published views, that 'from the Laurentian epoch down to the present day, all the physical events in the history of the earth have varied neither in kind nor in intensity from those of which we now have experience,' the question naturally suggests itself whether there is not some difference in the working of natural forces in an epoch which differs from all past periods in the world's history, by the presence of a new force, that of human intellect, capable of controlling Nature. On this account, it has seemed useful to consider briefly the geological importance of man, the influence, in this wide sense, of mind upon matter, and the efficiency of this new agent in modifying all existing forces of Nature.

It appears evident that the greater part of the earth's surface would, if left to itself, be covered with vegetation. Even the hardest and most barren rock, if left undisturbed, soon becomes

thickly covered with vegetable growth, which, by its yearly decay, contributes to increase the thickness of the soil. The agricultural history of every country, however, shows that, as civilisation advances, increasing areas of land are cleared for cultivation, or turned up by the plough, and exposed to the unimpeded action of atmospheric agencies. Between 1860 and 1870, it is estimated that sixteen million acres were cleared in America alone. The extent to which denudation has been increased by clearing land has been proved by direct experiment. A slope of forty-five degrees was divided into three belts, one luxuriantly wooded, one completely cleared, and one partially cleared. In the first or highest, the rain formed no ravines; in the second, three ravines; and in the third, four ravines, extending down to the belt of wood, where they narrowed and disappeared. It has long been noticed also that forest rivers seldom form large sedimentary deposits at their estuaries. This is well shown in the case of the two rivers Sestagone and Lima, which drain two great valleys of the Tuscan Apennines. The banks of the Sestagone are clothed with firs and beeches; but the Lima flows through cultivated fields. At the junction of the two rivers in rainy weather, the Lima is turbid and muddy; while the Sestagone remains limpid and drinkable.

According to Lombardini, the Po now transports three times as much sediment as formerly, the increase being chiefly due to the destruction of the forests, and the consequent increased denudation of the Alps. French engineers estimate that the delta of the Rhone has advanced at a rate far greater than it did previous to the cultivation of its valley. In the Eastern United States, wherever a mountain slope has been stripped, incipient ravines quickly form, and enlarge with such rapidity as to excite the attention of geologists. This is especially the case with the sandy soils of Maryland, Georgia, and Alabama, previously covered with pine forests. The Black Earth of Russia, one of the chief sources of the agricultural wealth of the empire, is quickly cut

up into huge ravines, and the finest soil in Europe is being rapidly carried away to increase the deltas of the Volga and the Don, and to silt up the Sea of Azov. During the great floods of 1866 and 1868 in France and Switzerland, the wooded soils alone escaped being washed away. The immunity of the provinces of Brescia and Bergamo from damage by the great floods of 1872, was chiefly due to forestal improvements. During ten years, the department of the Lower Alps lost sixty-one thousand acres of cultivated soil from the effects of torrents; and the clearing of the forests of the Ardèche has resulted in the covering up of seventy thousand acres of good land with barren sand and gravel.

It is thought by many that vegetation elevates the surface as much as water depresses it. This, however, can only be the case when natural vegetation is suffered to decay on the ground in which it grew. In the case of cultivated crops, which only partly return to the soil, this elevation of the surface cannot take place; and its compensating effect being lost, denudation is relatively greater from this cause alone.

Hence, it appears that one result of man's influence, by laying bare large tracts of land for cultivation, has been greatly to increase the erosion of the surface. In some instances, however, the action of man has been to check the natural transport of sediment. This especially has been done in the case of shifting sand-dunes and encroachments of the sea. Along that part of the French coast which extends from the Gironde to the Adour, the sea throws up annually one million two hundred and forty-five thousand cubic metres of sand, which the wind heaps up into hills, and carries inland, overwhelming villages, and converting streams into marshy pools. The annual progress of these sand-hills was so great that in many parts of Bretagne, the tops of chimneys, above a sea of sand, alone marked the site of buried villages. The amount of dune-land in Western Europe alone has been estimated to cover over a million acres; and still larger deposits exist in parts of Africa, Asia, and America. The destruction caused by these shifting sands has, from an early date, attracted the attention of governments; and the result has been to check their ravages by *careful planting*. Thus has man's ingenuity been successfully opposed to the action of the agencies which have caused those endless wastes of drifting sands in Poland, Peru, and the United States; and to the devastation which has resulted in the formation of the landes of Gascony, Sologne, and Brenne, and the Campine sands of Belgium.

Not only does the artificial protection of dunes prevent the overwhelming of inland tracts by deposits of sand, but it checks also the ravages of the sea itself. It is needless to dwell upon the numberless instances in which large areas of land are by this means saved from inundation and destruction, especially on the coasts of Denmark, France, and the Netherlands.

But besides these immense modifications in the results of denudation and transport of sediment by both wind and water, the result of hurrying the water from the surface of the land by agricultural draining, and its far more rapid transmission than formerly into the sea, must be to diminish per-

colation into the interior of the earth. Seeing the important part which water plays in the metamorphism of rocks, any diminution in the amount of water permeating rocks must diminish the amount of mineralogical change, and retard considerably the progress of metamorphism; so that it is possible that the operations of man upon the surface of the earth may affect the working of those chemical changes in the interior of the earth's crust, which would appear to be far removed from the influence of human action.

The agricultural history of the civilised world is full of instances in which great changes of climate have resulted from clearing and draining the land. Independently of the mechanical action of forests in resisting cold winds, and of their effect upon the humidity of the air, it cannot be supposed that so large an amount of wood can have been felled without affecting considerably the electrical and chemical condition of the atmosphere. Whether the progressive diminution of rainfall in England, shown by Glaisher's tables for the past fifty years, and the secular desiccation apparently going on in other countries, are due to agricultural operations, cannot be distinctly proved in the absence of sufficient rain measurements. These changes may be cosmical, or they may be due, as some physicists maintain, to the diminution of water which results from its entering into new inorganic combinations. But the researches of Ebermeyer and others seem to show beyond doubt that the extensive clearing of forests has caused great changes in the distribution of rainfall, although the total amount may be unchanged. The result of timber-felling appears to decrease the rainfall over the land, and consequently to diminish the action of those forces which depend upon the action of water.

By irrigation alone, great local changes are made in the humidity of the atmosphere. Thus, Egypt contains not less than seven thousand square miles of artificially watered soil; Lombardy, Sardinia, and France have three thousand square miles; in India it is estimated that not less than six million acres of land are under irrigation; while in Western America, thousands of miles of canals have been constructed. We have only to estimate the total surface of evaporation from these artificially watered parts, to gain some idea of the increase of moisture in the atmosphere by this means. On the other hand, evaporation has been materially diminished in some parts by extensive draining of cultivated land, as well as by the reclamation of lakes and marshes.

That this tendency of man to disturb the balance of physical forces, is not counteracted in Nature by compensating conditions, seems proved by the magnitude of the results which have been produced within a comparatively short time, and which have an undoubted connection with man's dominion over the earth; but even if those results had been small, it must be remembered that the time of man's action has been of limited extent, and that, in geology, it is by small changes, continuing for long periods of time, that the most striking results are produced.

But it is in the organic world, in the geographical distribution of animal and vegetable life, that man's influence is chiefly felt. The facilities which commerce and human intercourse afford for the dispersion of vegetable species, is un-

equalled by any other provision of Nature. Both by chance and by design, new species are introduced by man, at a rate which can never have occurred before his introduction upon the earth. Thus, when St Helena was first discovered, its flora consisted of sixty species; but now it has seven hundred. In fact, it is becoming a continually more perplexing question in botanical geography, how far certain species may be regarded as indigenous or exotic. Nor can it be said how long certain species of wild plants will be able to survive the inroads of cultivation, which is fast usurping the surface of the earth. Latham tells us that the indigenous flowering-plants of North-west America have been nearly extirpated by the inroads of half-wild vegetables, which have come over in the train of English emigrants.

Thus, partly by human design, partly by accident, resulting from human actions, is the extirpation of certain vegetable species hastened. Whether some plants have been totally extirpated, as some botanists think, in historic times, or not, it is without question that immense changes have been effected in local distribution, as also in the extirpation of species from certain localities where they previously abounded.

In the animal world, man can scarcely be said to have caused such changes in *distribution* as has been the case with vegetable life, since domestic animals alone would be introduced into new localities intentionally; but he has played a far greater part in the *extirpation* of animal species. It must be borne in mind, however, as Sir C. Lyell remarks, that the disappearance of certain animals must not be ascribed to human action alone, although their extinction was no doubt hastened by his agency. In every country, man wages war with destructive animals, which hence rapidly decrease in number, until finally they become extinct. Not even in the ocean are animals free from man's interference; for the wholesale destruction of many of its larger denizens has allowed an increase in the number of the smaller organisms on which they live.

But perhaps in no instance has this interference of man with the harmony of Nature been more noticed than in the case of birds. Agricultural history is replete with the alarming evils which have resulted from an ill-advised destruction of birds. The slaughter of small birds in France led to such a plague of beetles, that nearly every root was consumed in the fields; and, without doubt, any cause, which might lead to a diminution of owls in Italy, would tend to increase the number of inundations of the Po, which are most frequently traced to burrows in the embankments by mice and moles, upon which owls feed.

So mutually dependent is the natural condition of animal and vegetable life, that interference is more effective here than in inorganic nature. Preyer beautifully exemplifies this mutual relation of animal and vegetable species, when he says: 'The finest clovers and the most beautiful pansies are found near villages where cats and owls abound; for these destroy mice; and mice destroy the humble-bee, which alone fertilises the clover and the pansy.' The slaughter of animals which are of commercial value to man, has reached such a pitch that no natural means of reproduction can withstand the loss; nor can we possibly know the extent of the revolution in the whole

organic world, which has been produced by this means.

When we see, then, that by the work of man the rate of denudation is increased, and sediment more rapidly transported to increase the deltas of rivers; when we find the ingenuity of man combating with the power of the wind and waves, and effectually checking the removal of sand and the erosion of the sea; when, by his action, great local changes are made in climate and in the flora and fauna of a district; we can no longer deny to man an important place amongst geological agencies. Although powerless to destroy the forces of Nature, he can influence them to a degree unknown before, and, under the impulse of caprice, effect such changes in a few years as it would otherwise have taken long geological periods to accomplish. Compared with the length of a geological epoch, the almost ephemeral duration of human power on the earth has been marked by changes so great as to show that the influence of mind, though the last to be felt, is by no means the least of those agencies which modify the condition of our earth.

In the organic world, in which man plays the most havoc, so delicately balanced do all the parts appear to be, that the smallest interference affecting a single species is transmitted throughout, and is felt in quarters far removed from any apparent relation to the disturbing cause. If it were possible to view all the changes which have been wrought in the routine of Nature, greater evidence of geological change could scarcely be found in any epoch than that which has characterised the human period. To conclude with the words of Mr A. R. Wallace: 'The true grandeur and dignity of man is that he can control and regulate Nature, and keep himself in harmony with her, not by a change in body, but by an advance in mind. Not only has man escaped natural selection himself, but he is able to take away some of the power from Nature which before his appearance she universally exercised. We can anticipate the time when the earth will produce only cultivated plants and domestic animals, and when the ocean will be the only domain in which that power can be exerted which, for countless ages, ruled supreme over the earth.'

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER XLIV.—THE WESTONS.

BERTRAM OAKLEY, when he consented to be brought back to Portland Place, to the luncheon which, apparently, there was no escaping, found himself alone in the great empty drawing-room. Then there were the opening of a door, the rustle of silk, and the heiress it was who sailed in, Julia Carrington, not less beautiful, not less elaborate in her toilet, than on that other well-remembered day when she had tried all the spells that beauty and cleverness combined can muster for the enthrallment of men, to bring Bertram to her feet. Yet this time, the proud girl approached him with a shy, hesitating manner, that was wholly foreign to her usual bearing. 'Mr Oakley,' she said quickly, but in a voice that trembled, 'we ought to be friends, you and I. I will be, if you will. Here is my hand.' She held it out as she spoke, that white, soft hand, on the fingers of which

bright gems shone; and Bertram took it wonderingly. It pressed his frankly enough, and then dropped. 'I want us two to be friends,' pursued Julia—'real friends. Man and woman, people say, cannot be such. I hope it is not so. It would be a dreary look-out if your sex and mine could never be honest and true, and even care for each other, without having to choose between love or hate, or utter indifference. I, for one, wish to be your friend, and nothing more.'

She meant what she said. Bertram knew that the words he heard were sincerely spoken, that the haughty heiress had for the moment risen superior to the baser part of her nature, marred, but not ruined, by precocious prosperity. He was touched. He said something—he scarcely knew what—in reply to what she had said to him. It sounded in his own ears trite and lame. We cannot all be eloquent upon the spur of the moment, and Bertram had been taken by surprise.

'You have behaved nobly,' said Julia hurriedly. 'You have been like some of the knights we read of—they were very few, alas!—without fear and without reproach. I wish I had had a brother like you, Mr Oakley; and I wish us to be friends. I did not say so,' she added with a blush, 'the last time we talked together.'

'That is past and gone,' answered Bertram gently. 'Your friendship and your good opinion, Miss Carrington, do me much honour, and I prize them, I assure you, very much indeed. I may venture, perhaps, to hope that you will be a friend, too, to Miss Rose Denham, the daughter of my earliest benefactor, and who has just consented to be my wife. Our engagement will be no secret, soon; but this is the first time that I have spoken.'—

'I will,' responded Miss Carrington quickly, as the door opened, and in poured, like a tide, the well-meaning womankind (to quote the late lamented Jonathan Oldbuck) of the Weston family, all cordial welcome, genial smiles, and harmless platitudes. Mrs Weston was very glad. Margaret Weston was very glad. Matilda Weston was very glad. There was a sameness in their congratulations; but they were genuine and womanly and from the heart, and Bertram could not receive them unmoved. They would pet him, and prattle to him, and make a hero of him, as their kindly natures prompted, because of the foul wrong that had been done him, and because he had come spotless out of the cruel trap that had been laid for his undoing. Bertram, as he listened to their sympathy, or deprecated their encomiums, half-wondered how it fell to his lot to be so praised and so singled out for commendation and liking, as he was. But he was thankful for the friends he had found, and for the regard he had won, without considering that he bore about in his own loyal heart and bright spirit the talisman that wins love and respect from all but the vilest or the dullest. And then in came Arthur Lynn and Mr Weston, and the conversation became general, and luncheon being announced, Mr Mervyn's nephew gave his arm to the heiress.

Luncheon, on that day, was a much more elaborate meal in the Weston household than was usually the case. The master of the house, who was never, save on Sundays, at home at that hour, had consented to grace the entertainment, which,

by tacit agreement, was supposed to be given in honour of Bertram Oakley. Bertram himself bore his triumph very modestly; and the men of the party, by some masculine instinct, kept the conversation from taking too personal and emotional a turn. Arthur Lynn was very attentive to Miss Carrington. Mr Weston was unusually talkative, and even raised a laugh by attempting an imitation of old Isaac Bond, the marine storekeeper, when, with the effrontery of a veteran sinner, he had demanded compensation for a night in custody and an appearance in the police court.

'If there were no receivers, there would be no thieves, as the saying is,' remarked Mr Weston in conclusion; 'but I doubt, in this instance, whether the old man's perverted conscience enables him to distinguish between light and darkness, between evil and good. His business is to buy; and his customers are rarely, I am afraid, strictly honest, from the cook that brings dripping, to the area-sneak that brings spoons.'

'And Crawley—what is the wretch to do?' asked Mrs Weston, who would have liked, as women do like, to see poetic justice executed in some modified degree, and who thought that the traitor, if he escaped guel, hair-cropping, oakum-picking, and the crank, ought at least, in the fitness of things, to sink to a broom and a street-crossing.

Mr Weston shook his head. 'I fear,' he said, 'that our interesting penitent of to-day, though I have not the smallest doubt of his ability to get his bread, will not earn it honestly. There are so many grooves, now, into which a sharp, plausible scoundrel can insert himself, that I suspect Henry Crawley will prefer the crooked path to the straight one.'

'It is a pity,' said Bertram. 'He spoke truly enough when he reminded us that he was a skilled accountant and a capital clerk. Perhaps, if he were to emigrate'—

'If he did,' interrupted Arthur Lynn, laughing, 'we might hear of him yet in half-a-dozen incongruous capacities: now as a Mormon missionary; now as the decoy-duck of a New York gambling-house; and presently, perhaps, as a road-agent in California or Colorado, as our American consins style the Captain Macheaths of the New World.'

'He had hardly courage for that,' answered Mr Weston; and then the subject dropped, and every one present felt assured that Mr Crawley, at any rate, had left but a memory of his misdeeds behind him.

### THE LONDON GUILDS.

In the hope of turning their researches to profitable account some day, the Educational Endowments Committee of the London School Board have laboured hard in gathering information respecting the annual revenues of the various City guilds from charitable trusts—revenues ranging from the modest four pounds four shillings and ninepence of the Gold and Silver Wire Drawers, to the Mercers' Company's thirty-seven thousand two hundred and eighty-nine pounds twelve shillings and fivepence.

According to the Committee's Report, the fifty-nine Companies concerned are bound annually to disburse the following amounts. In gifts of money, one hundred and five thousand seven

hundred and ninety-two pounds thirteen shillings and sixpence; for educational purposes, sixty-five thousand one hundred and thirty pounds thirteen shillings and sixpence; for medical aid, four thousand and eighty-nine pounds and sevenpence; for sermons and lectures, three thousand and eighty-three pounds four shillings and tenpence; for apprenticeships, two thousand nine hundred and eight pounds sixteen shillings and tenpence; for clothing, eighteen hundred and seventy pounds one shilling and tenpence; for church expenses and impropriations, seven hundred and forty-eight pounds two shillings and fivepence; for food, five hundred and twenty-four pounds thirteen shillings and sixpence; for coals, three hundred and eleven pounds five shillings and tenpence; for repairing of highways, a hundred and twenty-nine pounds seven shillings; in loans free of interest, eighty-seven pounds ten shillings; for candles used at sermons and lectures, nine pounds; for poor-rates, six pounds; for Bibles, three pounds; for providing wool and flax to afford means of employment, three pounds; for marriage portions, two pounds six shillings and eightpence; and for divers objects, so mixed together as to render it impossible to trace the proportions, eleven hundred and thirty-one pounds seven shillings and tenpence. Making altogether a hundred and eighty-five thousand eight hundred and twenty-nine pounds seventeen shillings and elevenpence, or something over three pounds ten shillings for every man, woman, and child actually dwelling in that world-famous business mart 'the City.'

Not a few of these trusts are only charitable ones in so far as that they exemplify the charity that begins and ends at home. It was for strictly selfish ends that John Ashton, four hundred years ago, gave certain premises to the Fishmongers' Company conditionally upon the anniversary of his 'obit' being solemnly celebrated with note and ringing of bells in the church of St Sepulchre; and that John Heron, a century later, conveyed some messuages and tenements to the same Company, to pay annually five marks of lawful money of England, for the augmentation of the benefice of the Blessed Lady of Little Ilford, providing the holder of that benefice remembered to make particular mention of his benefactor in his praises to Almighty God. So too, Richard Mervayle bequeathed property, now worth nine hundred pounds a year, to the Vintners' Company, with injunctions to expend the annual proceeds upon prayers for his soul. Trusts of this sort, coming under the ban as bequests for superstitious uses, have been long since diverted to other purposes.

Another method favoured by your ancient citizen desirous of keeping his memory green, was to leave money to insure the delivery of an appropriate discourse on the anniversary of his death. Our forefathers had great faith in the power of preaching, and were given to providing for the preaching of sermons upon particular saints' days, and the anniversaries of particular events, such as the destruction of the Armada, the Martyrdom of Charles I., and the discovery of the Powder Plot. William Lamb left funds to pay for the preaching of four sermons every year in the church of St James-in-the-Wall, at the rate of six shillings and eightpence per sermon. John Wood set a higher value upon pulpit eloquence, leaving certain lands

in trust to the Bowyers' Company, with injunctions that the Master, Wardens, and Livery of that guild should, every other year, upon the day appointed for swearing in their Master and Wardens, attend at St Nicholas's, Cole Alley, and hear a sermon. The parson was to be paid thirty shillings; his clerk and sexton, one shilling and sixpence a piece; the beadle of the Company, two shillings; while fifteen shillings was to be distributed, in twopences, to such poor folks as the Bowyers might meet on their way to and from the church. To meet the spiritual needs of Bromyard, where he was born, another well-to-do citizen left sufficient to pay for a weekly lecture there, to be 'preached' in the parish church on market-day, by one or other of the holy divines in the neighbourhood, who was to be paid ten shillings for his pains.

John Kendrick was evidently an advocate of early rising, since he directed that the two thousand four hundred pounds he bequeathed to the Drapers' Company should be devoted to paying the curate of the parish of St Christopher twenty pounds a year, to read divine service daily in the parish church, at six o'clock in the morning; rewarding the clerk and sexton with fifty shillings a year for attending such service, besides paying the costs of lighting in the winter. Robert Hunt instructed the Brewers' Company to invest two hundred pounds as they thought best, and apply the interest to paying ten pounds annually to the Vicar of St Giles's, Cripplegate, so long as the said Vicar exercised the catechising of youth within that church, every Sabbath-day, from one until two o'clock in the afternoon, between Michaelmas and Midsummer.

Among the numerous trusts for educational purposes, may be specially noted that of Sir William Boremans, Clerk of the Green Cloth to Charles II., by which the Drapers' Company was bound to apply certain rentals for the benefit of a score of Greenwich-born boys, sons of seamen, watermen, or fishermen resident in East Greenwich—preference to be given to the children of such loyal men as had served the king in his wars—who were to be boarded, lodged, and instructed in reading, writing, arithmetic, navigation, the Catechism, and the doctrines of the Christian religion, until they reached the age of sixteen; when they were to be apprenticed or 'otherwise provided for.'

When, in 1540, Nicholas Gibson and Lady Ayrice, his wife, handed over a school they had built to the Coopers' Company, they covenanted that main-tenances—at ten pounds a year and rooms—should be provided for a Master learned in grammatical science, to instruct the elder boys in the same; and teach the younger ones spelling and such things as were proper for them, until old enough to be initiated into the higher mysteries of 'grammatical science.' The Master of this school—still in existence—receives just thirty times the amount prescribed by its founders.

Many testators charged their trusts with annual allowances to university students, five pounds being the common amount of the gifts. Probably that was about the sum the Merchant Taylors' Company originally had to apply towards the amendment of the 'victuals and batteling' of five poor studious scholars of St John's College, Oxford, inclined to bend their studies to divinity,

out of the rent derived from a house in Cannon Street, devised by Walter Fish; but if the modern recipients of this gift get their strict due, they should enjoy an allowance equal at least to that of an ordinary exhibitioner.

Trust-creators with a kindly feeling for beginners in their own line of business, bequeathed funds for advancement to young tradesmen, sometimes altogether free of interest, but usually requiring some return for the accommodation, either in cash or in kind. For the use of twenty-five pounds, for example, the borrower had annually to distribute one thousand good Kentish billets among the alms-people of his fraternity. Eight loads of charcoal were to be divided among the 'poor bedsmen of Whittington College' and the poor of certain parishes, by the four young mercers indebted to dead Humphry Baskerville for the loan of fifty pounds apiece; while the two yet luckier ones, who shared Alice Blundell's two hundred pounds between them, were bound to find thirteen penny loaves every week for as many poor people of St Lawrence, Jewry. Under the will of William Barlow, Bishop of Lincoln, who died in 1690, the Fishmongers' Company became possessed of a hundred pounds for lending out in sums of twenty-five pounds, at three per cent.; the interest to be devoted to the following purposes: Thirteen shillings and fourpence to be paid for the preaching of a sermon in Croydon Church on the anniversary of the founding of Whitgift's Hospital; three shillings and fourpence to the Vicar of Croydon for announcing the sermon the preceding Sunday; thirteen and fourpence to be spent on a dinner to the poor of the said Hospital, and ten shillings put into its common box; thirteen and fourpence to be divided among poor freemen of the Fishmongers' Company; and the remaining six shillings and eightpence to be retained by the Company itself for seeing these things performed.

An ardent enemy of outside competition was Thomas Scrimshaw, from whom the Pattern-makers' Company derived the interest of a thousand pounds in the Three per Cents., half of which was to go towards defraying the costs of bringing unlawful workers to book; and if not wanted for that purpose, to be spent upon a march and dinner upon Lord Mayor's Day. Under another bequest, the churchwardens of St Clement's, Eastcheap, are entitled to claim ten shillings every Thursday before Easter, to provide two turkeys for the parishioners, to be eaten at their annual 'reconciling feast'. We find another jovial citizen bequeathing three pounds per annum to the Goldsmiths' Company to pay for a dinner; another leaving one pound six shillings and eightpence to pay for a dinner for the governors of the Mercers' Company, and the like amount for cake and wine to follow; while a third expected the Cutlers to make merry upon three shillings and fourpence; and fifteen shillings was held sufficient to provide a Christmas feast for the churchwardens, vestrymen, and overseers of a fourth donor's parish.

Just three centuries ago, Lady Mildred Burghly directed the Haberdashers' Company to expend annually four pounds six shillings and eightpence upon twenty 'messes' for twenty poor householders or widows; each mess to consist of two-pennyworth of beef, one pennyworth of wheaten

bread, and one penny in money. Later on, John Banks left the Barbers' Company twenty shillings a year for ever, that upon the eleventh of May, twelve poor members of the Company might each receive twopence in money, a twopenny loaf, a wooden platter, and his proportion of six stone of beef. A dole of bread was a very common benefaction when the penny loaf was a good deal bigger than it is at the present day. Notable among such gifts was that of Barbara Burnell, who bequeathed three hundred pounds to the Clothworkers' Company wherewith to buy land, and from the income thereof give seven pounds a year to the parson and churchwardens of the parish of Stanmore, to distribute a shillingworth of bread among the parish poor every Sunday, pay the clerk a couple of shillings for keeping her monument clean, and expend the residue in woollen cloth to make waistcoats and safeguards for six poor women. Another Burnell supplemented this gift with sufficient to provide the recipients of the bread with a due allowance of good Suffolk cheese.

Considerations of space forbid detailed mention of the many gifts of clothes, figs, coal, and charcoal, included among the charitable trusts of the City Companies; but we must note how Thomas Jordeyn, who, in 1163, left sufficient to furnish sixteen poor freemen and freewomen of the craft of Fishmongers with a winter's fuel, desired that the Lord Mayor might take the oversight of the distribution, and directed three shillings and fourpence to be paid to the common clerk to remind His Lordship to do so.

Most of the trusts are saddled with payments to official personages for assisting at their execution; but this usually efficacious method of insuring the fulfilment of the trust conditions did not suffice Dame Elizabeth Moryo, who bequeathed all her property in the parish of St Olyffe to the Armourers' Company for certain objects, very precisely specified. Her trust deed set forth that the wardens of the Bridge House were to search once a year whether the conditions of the trust were kept; and upon finding the Armourers failing in their duty, to take over the estate themselves. In case they too neglected to carry out the worthy Dame's injunctions, her executors were to sell the property, and distribute the proceeds among poor maidens on their marriage; and should the executors fail, then the rightful heir of the legator should step in and claim the estate.

## MY TROUBLES IN RUSSIA.

### TROUBLE THE FOURTH.

It is four months since that broiling August afternoon when I sat on the deck of the little steamer which runs between Plescow and Dorpat, watching the spinster sitting stolidly in the blaze of the sun behind a wall of miscellaneous belongings. I remember observing how the sun beat on the exterior of that carpet-bag of hers, and wondering whether the sugar and the candle-ends were amalgamating. I tell my friends now, as a prime joke, what then I regarded as a decidedly practical one, how we ran aground at the mouth of the Embach, almost within sight of our destination; how uproarious the spinster became, and what a wait we had for the turn of the tide to carry

us over. But these are all things of the past, and I too am changed. I have grown, if not in grace, at least in experience. In my dealings with the Jew stall-keepers, I no longer give them what they ask for their wares, as I used to do in my innocent days, but have learned to haggle and bargain with tact and discretion, until I verily believe I procure my requirements at almost their legitimate value, though it is tough work.

Meanwhile, the scene too is changed. In place of dusty lime-trees, with drooping, listless leaves, and dazzling sunlight beating on the scorching white pavement, is the still more dazzling snow. The sun still shines, but with a cold, chilly splendour—brightness without warmth. The trees are draped in a new foliage, which glitters and flashes like myriads of diamonds. It is a rare day! It is twenty degrees (Reaumur) in the shade, and the air quivers and sparkles with countless crystals. They seem to remain stationary in mid-air, twinkling like tiny stars, and yet my muff is covered with them. There is not one exactly like another, so manifold is their beauty. I hurry along with shortcoming breath, for this kind of weather gives labour to the lungs, and on my arm I carry a small packet carefully sewn up in brown holland. My destination is the post-office.

*Homo*, like the monkey, is an imitative animal; and I am like the rest of my species. Everybody has been making Christmas presents for relations and friends at the approach of this festive time; why should not I do likewise? Why should not I surprise my loved ones at home with some little gifts made with my own hands? Delighted with the idea, I have carried it into execution, and am now on my way to the post-office, with my thoughts away over the sea, in a gray, dingy, manufacturing town, where the sun is not shining clear and bright, as here, but struggling tearfully through smoke and fog; and yet, smoky, dirty, northern town, to be with thee even in thought, is to be happy! The post-office is in the centre of the town; and I am soon climbing the high stone steps, and push open the swing-door leading into the Parcels Expedition Department. As I enter, a wave of heated air, laden with tobacco, leather, and the perspiration of many races, closes round about me, and almost stifles me. The office is crammed with people waiting their turn. There the Russian, the German, the Jew, the Lett, the Esthonian, are represented. They are packed like bees in a hive; and the stove, which covers half the side of one wall from floor to ceiling, is heated to splitting, as it always is. A dead silence prevails, except for the curt questions of the official, and the replies of the fortunate individual who is being attended to. I take my stand ruefully at the outside of the crowd, and relieve myself of as many wraps as I can. Meanwhile, the swing-door behind me is in constant motion until I am hemmed in on all sides by fellow-sufferers of both sexes. I can see nothing but the backs of those in front of me, and the staring white face of a clock which looks down on me from a corner. It affords me grim satisfaction to watch her spider fingers crawl from minute to minute with laggard pace, and feel that I am slowly nearing the goal; and oh, what comfort when the mass is parted, and one more makes for the door, and we surge

on one step nearer! But the heat is insupportable, coming from the sharp thin air into this thick, scorching atmosphere; and long before I have reached the counter, I feel as if I must give it up, and return whence I came with my business unaccomplished. My head is swimming, my senses dazed, and my feet aching with the prolonged stand. At length, when I can count those before me, I take courage, buoyed up with the hope of approaching release. Now the broad shoulders of the Lett who has been forming the last barrier between me and that mighty dispenser of favours, the post-office official, have sidled away, and I start face to face with the official. I look up into his square-jawed, stolid face, with its bushy eyebrows, as I hand him my packet without a word. He receives it silently at first, and looks at it until gleams of malice shoot over his fleshy face.

'What is this?' he asks.

'It is for England,' I reply. 'I have put it on the address.'

He stuffs it roughly back into my hand. 'We do not accept such parcels,' he says. 'You must sew it in oilcloth.'

'But it is quite safe,' I remonstrate.

He cuts me short with a wave of his hand. 'It does not matter—such is the rule. Take it away, and sew it in oilcloth.'

I still hesitate. All this waiting and suffering in vain—all to go over again. It is too bad.

He glares down upon me: 'Now then, make room, will you?'

I quail, and move away, and my place is filled by another. I look up at the clock, which seems to mock me as she points to twelve. I have been two long weary hours in this place, and all for nothing! As I hurry homewards, I inwardly resolve that no power on earth shall induce me to sew my packet in oilcloth and return to meet that official's leer on the morrow. No; I would rather throw the thing into the Embach—though I should have to make a hole in the ice to do it. But calmer thoughts come with the morrow, and I am now retracing my steps to the post-office with a broken resolve in my heart, and a small packet neatly stitched in oilcloth in my hand. But I am not the woman I was yesterday. My step is less elastic and swift; and as I mount the stone steps and enter upon the scene of yesterday's humiliation, my spirits are chill and gloomy. I have a longer wait to-day than yesterday, for it is one day nearer Christmas, and as the great feast-day approaches, the crowd at the post-office intensifies.

It is a long lane that has no turning; and behold me once more handing my packet over the counter with averted eyes, which fear to look defiance. The big unclean hand closes upon it, and it is turned and twisted on all sides. 'Ah, there is no flaw this time!' I exultantly think. At length he holds out that other fleshy hand, and I look up, startled and inquiring.

'Your sealing-wax and seal!' he demands, whilst the gleams of malignity spread and deepen from the crow's feet in the corner of his eyes.

'What?' I ask confusedly.

'Your seal—your seal!'—this time with brutal impatience.

'I—I have none,' is my trembling rejoinder.

The parcel is thrust back into my hands. 'It is

no use coming here and troubling us with a packet like that; you ought to inform yourself of the regulations before you come here taking up people's time.'

'What is the matter? I have sewn it in oil-cloth, and done everything!' I reply desperately.

He turns from me insolently, and signs to the next comer to take my place.

This is more than human flesh and blood can bear in silence. I cast on my torturer a look which ought to have shrivelled him up like a leaf in the fire. 'What do you mean?' I say, choking with anger. 'Are you going to send this packet away or not?'

He has pulled a ledger towards him, and is writing something in it, or pretending to do so. But I know he is listening, for the hateful gleams spread thicker over his face. Presently he holds out his hand for the next packet. I turn round towards the sea of heated faces behind me, and inquire of the person nearest me: 'Is it possible that what that man says is true, and that after waiting here hours, for two days, I must again return home with my packet? It is a shame—a shame!'

It happens to be a gentleman whom I am addressing. I recognise him to be one of the German Professors at the University. As I finish, he pushes his way to the counter. 'Look you,' he says in a firm voice, 'I would advise you to send off this lady's parcel.' He takes it from my hand as he speaks. 'You know as well as I do that you can seal it with the government seal, if you choose.'

There is no reply. The man is doggedly examining the packet which he holds. The Professor waits a minute, his eyes fixed upon him. 'Good!' he says at length. Then turning to me, my champion continues in a clear voice, which may be heard all around: 'I regret, young lady, that I cannot compel this man to send off your packet; but I hope I shall be able to punish him; it will not be my fault if I don't.' He returns me my unfortunate packet; and as I take it, I cannot help stealing a sidelong glance at my foe. His face is crimson. I thank my champion, and am going, this time with a resolve which shall not be broken; when, to my surprise, the huge hand is held out once more. I can scarcely believe my eyes.

'Give it here!' he growls without raising his eyes.

I hand it back silently, and exchange glances with the Professor, who is smiling behind his hand. It is all the work of a minute: the government seal is stamped on the ends of the string with which my packet is tied; I pay an exorbitant sum for its transport to England, and my trouble is at an end—but not my story. Five years later, when I am back in that smoky English town where I love to be, I learn that my packet, for which I had so dearly paid, both in body and in hard cash, had arrived long after it was due, and that my roubles had found their way to the insatiable pockets of the Russian post-office official. The packet arrived at its destination—unpaid!

#### TROUBLE THE FIFTH.

Like Silas Wegg, I feel this morning as if I must even drop into poetry, in order to convey to the sober, English minds of my readers a faint idea of

the great wonder of this Russian Spring after the long protracted sway of Winter. I have watched him creep scowling away to the hills, dragging after him his trailing skirts of rattling ice. And now Spring is splitting her sides with mirth. She has it all her own way now. I see her sit on the margin of the stirring woods, weaving the sunbeams into her streaming tresses. She gaily tosses in the sun the vernal tassels of her robe, whilst, like that wondrous maiden in the fairy tale, she scatters jewels over the ground at every lisping of her gracious lips. And the lark, her *minnesinger*, is as mad as she. He showers his rapturous notes so full and fast that he is choking himself in his ecstasy. As I try to catch a glimpse of him up there in the dazzling void, I think of that emulous thrush who sang so long and so tenderly that he burst his little ambitious heart and fell dead. Take care of yourself, sweet heavenward messenger.

And I am off for a holiday! At this moment, I am toiling up a steep hill in the rear of the diligence which runs between Dorpat and Riga. I am bound for a 'station' midway between the two towns, where a carriage is to meet me, and convey me to my destination, a pretty, country estate in the interior of Livonia. I am in the humour to enjoy everything; even the clouds of dust in which we are enveloped are capital fun. A very little provocation would make me cut a caper in the faces of the solemn German baker who is trudging by my side, and the two Russian priests at our backs. They keep at a lofty distance from us, handling their long loose robes as women do their petticoats. They have their perfumed locks flatted, to preserve them from the dust. We have eight hours of it together; and seated cooped up in a stuffy diligence is not very amusing on a spring day. I make the best of it. I am delighted each time that we come to a hill, and there is an excuse to get out and walk. Oh, what I would give to sit on the box beside the driver; but decorum forbids! At mid-day, the sun beats fiercely—'it stings,' as the Germans say; and all through the afternoon, I have enough to do fanning myself with my straw hat, which I have taken off for the purpose, and wiping the dust and moisture from my heated face.

When we reach the place where my fellow-travellers and I part company, it is six o'clock, and the sun is sloping to the west. I spring to the ground like an india-rubber ball, and look round, like a second Cinderella, for my carriage. It must be in the rear of the building, for it certainly is not visible. The station-master appears on the scene.

'Is there a carriage come from Waimel?' I ask eagerly.

I am answered in the negative. This is the first damper to my spirits. But I instantaneously rise above it. Of course not! How could I expect it to be waiting? What a goose I am! I might have remembered what a long way it had to come. I may have to wait half an hour, or even an hour. But what does it matter? Meanwhile, my luggage has been placed on the veranda; fresh horses have been put to the diligence, and I watch it drive away, leaving me behind. The station-master is gone to his own part of the building, quite away from the waiting-room, and I am alone.

What a dead stillness lies about the place! I wander a few steps from the door; but it is an unlovable spot. Nothing but sand, and a dreary, treeless tract of common, with here and there a tumble-down, smoke-stained cabin. They, too, look still and lifeless. Not a human being, nor as much as a dog, to be seen; nor is there the faintest curl of smoke rising from the roofs, to break the motionless dreary calm. The mist is beginning to rise in the hollows; I can feel its chill breath parting the warm dry air which envelops me where I stand. I shiver, and retrace my steps to the office.

The waiting-room is like all such waiting-rooms here—a square, unsightly den, with bare, white-washed walls; bare, beer-stained, deal table; bare floor; bare, staring windows, two in number; two deal chairs and a settle. I look ruefully round as I enter. What shall I do with myself? How beguile the time till the carriage comes? I recollect that I have a few books in my box. I fish up the first I lay my hands upon, which proves to be a volume of Schiller; it will answer my purpose as well as another; so I draw a chair to the window, sit resolutely down, and open its pages at *The Robbers*.

I am just beginning to read, when the blaze of light on my book makes me look up. The sun is just dropping behind the distant fringe of firs; there is little of him left, save a tress or two of his yellow hair rippling along the horizon; but the rays of his departing glory shoot upwards, and bathe the earth, the heavens, and the solitary station-house in a flood of golden light. Even the cheerless room in which I sit is for a moment metamorphosed. He takes me, too, into his good-night embrace. Now he is gone, and the gray shades of evening creep slowly on.

Surely the carriage cannot be long now? My heart aches with the sense of loneliness. If a bird would sing, or even a dog bark, it would be relief. What is that? A stir in the vestibule or entrance room. It is not a human footfall; it is a dragging, shuffling sound, unlike anything I have ever heard before. I do not like it. I half rise to my feet with my eyes fixed on the half-open door, when the door is pushed open, and I fall back into my seat paralysed with terror. What I see is a man—but a man raving mad, with the foam clinging to his beard! He creeps slowly nearer, with arms outstretched; and his nails are long and sharp, like an eagle's talons. His hair, like the mane of a wild beast, is matted and lustreless; and he is clad in a coarse serge gown, held together at the waist by a piece of knotted rope. He drags himself nearer—nearer, and gurgling noises proceed from his throat as he approaches me. I feel his scorching breath upon my cheek, and cannot stir. He bends over me, and puts a claw upon my shoulder. The spell is broken. With a sudden bound—so sudden that he is taken unawares—I am away under his arm, and have gained the door. I slam it behind me. I fly with feet that scarcely touch the ground across the vestibule, through another door, into a passage, and find myself at length in a bedroom. Through the confusion of all my mental faculties, I am led by a vague idea of seeking the inhabited part of the building and the aid of fellow-men; but the room I have fled to is deserted. Yet it is a refuge, and I dare not leave it to seek a safer.

The door is between me and my terrible pursuer. For a wonder, it is furnished with a bolt. I draw it, and fall upon the available furniture, all panting and giddy, and pile it too against the door. Then my quivering, enervated body gives way, and I sink upon the floor.

I hear the shuffling feet in the passage, the heavy breathing, and the awful gurgle in the throat; I hear him rubbing his body against the door like a savage beast in the woods. Then the dragging footsteps retire. I lay my head down on the bare deal boards, and I suppose I must have fainted, for I know no more, until I seem to waken out of a sleep, confused and dismayed. It is pitch dark, and my hands and feet are numb with cold. I sit up, and recollection rushes upon me. I listen fearfully. All is still. I know I am safe, and that the coast is clear; but I dare not for my life issue forth to seek assistance. Meanwhile, my mind is tortured by surmises. Is the carriage waiting for me? Have they sought me, and not finding me, returned without me? This thought makes my bitter tears flow. I am utterly helpless and desolate; it is dark, and I am shivering with cold; and oh, how perfectly miserable I am! I weep, until I begin to wonder where all the tears come from. At last, I hear the sound of footsteps in the passage; they stop at the door, and someone knocks.

'Who is there?' I ask, in a snuffly, suffocated voice, which sounds as if it belonged to some one else, as I scramble to my feet and begin to drag away the furniture.

'It is Mina,' is the reply, in the soft Esthonian tongue. 'Does *Präuli* [Miss] want anything?'

'Oh, wait, wait, dear Mina!' I cry, breaking my nails over the removal of the toilet-table. I feel as if this unknown Esthonian maid is a much loved sister, or an angel from heaven, so overjoyed am I to hear a human voice. When I succeed in getting the door open, I astonish her by falling into her arms and shedding more tears on her shoulder. She cannot understand me; it would be strange if she could; but she is a good tender-hearted soul, and tries her best to soothe me. She leads me along the passage; and opening a door at the end, I stand in the cheerful blaze of the kitchen fire. Oh, how comforting it is, after all those terrible hours of fear, darkness, cold, and loneliness, to sit in the full blaze and spread out my numb fingers to the warmth! The cook—the only other inmate of the kitchen—is stooping over an immense pan, preparing milk-soup for supper. She looks round at me—I am a strange apparition, no doubt—with wide eyes of amazement.

'Has the carriage come to take me away?' is my first question.

'No; there has been no carriage,' is the response.

'Then I must stay here,' I said to myself, 'at this awful place, all night;' and a fresh wave of distress washes over my already very sorrowful heart.

Mina comforts me. 'I will make it all right for *Präuli*. She will have some nice warm soup, and go to bed; and to-morrow, when she awakens, the carriage will be there to take her away.'

Then I tell her of my fright. The cook puts her hands on her hips, and listens too. They exchange glances of comprehension as I describe the appearance of the maniac; and when I have

told all, Mina says: 'Yes; that was mad Yahn. He lives on the waste with his brother, the *Perri Mues* [small farmer]. But he would not have harmed *Präuli*.'

'Harmed me!' I exclaim. 'He is mad, stark mad, and would have torn me in pieces, if I had not escaped from his clutches. It is a shame to let such people go at large.'

'But where is he to go, poor demented man? He is one of God's creatures, as well as the best of us.'

'Why do they not send him to the mad asylum? He would be taken care of there, and would not be allowed to go about terrifying people out of their wits.'

But I cannot make Mina understand what I mean by a lunatic asylum; she has never heard of such a place. I explain it to her, and tell her how our government takes care of mad people in my own country. But she shakes her head doubtfully. It is better to let the 'unfortunates'—as she humanely calls them—roam at will in God's world; and she tells me how mad folks can see and converse with spirits, and how they understand the language of the animals.

But the soup is ready, and the lights—a pair of candles—to show me to the waiting-room.

'No, no,' I entreat; 'let me have my supper with you, Mina. I cannot go back to that awful place.'

So I sit down with those two Esthonian maids, and feel warmed and comforted, and eat a hearty supper after all my sufferings. I do not know whether the station-master and his wife know where I am, and what I am doing, but they never appear; and I am lighted to bed by the kindly Mina. When she leaves me, I bolt my door; and so weary am I, that the madman does not even haunt my pillow, but I close my tired eyelids, and fall into a heavy, dreamless sleep.

#### PAVEMENT PORTRAITS.\*

##### A CIGAR-LIGHT SELLER.

ONE airless stifling night in August, I had taken a tramcar ride as far as Brixton, with the vain hope that I might find some exercise for lungs sorely tried all day with burning heat and absence of breeze; and, descending from the car at the end of its journey, I found myself in the midst of a party of holiday-makers returning to town, who had stopped at a wayside public-house to quench, and, unwittingly, to increase at the same time, the inordinate thirst which possessed them. The romps of the boys and girls of whom the party consisted were characterised more by vigour than by grace, and the adornments of their persons were more conspicuous for tawdriness than for taste. An impromptu jig played by an itinerant fiddler, accompanied by an execrating penny-whistler of about ten years of age, animated the party to such an extent, that they resembled nothing so much as a whole bunch of those dolls displayed in provincial marionette theatres, all huddled and entangled together, and all made to jump at once by the unseen string-puller.

While watching with surprise more than admiration the gyrations of this motley crew, I was

startled by a voice resembling the melancholy wheeze of an old-fashioned stand-up clock when it suddenly runs down, addressing me in these words: 'The Northeys of Northey Hall would think the mummers were come before their time. Mummers in August! Strange goings on, most strange!'

I looked round, and saw a little old woman, with a face which must have been singularly pretty years and years ago. Her hair, which was still very plentiful, was snow-white; her complexion was so clear, that many a Belgravian mother or grandmother would have given much of her income to possess it; her eyes, bright and piercing, were of a restless, changing gray-blue colour; her nose was small, straight, and delicate; and her teeth, as she showed them smiling at me in an interrogative manner, were as white and perfect as any turned out of Burlington Street or Saville Row; her hands, too, were white and delicate, and altogether she suggested to me a lady.

But her dress. Ah me, there was little of 'the lady' about that! Reckoning from the foundation—or rather from that portion of her costume which was nearest the pavement—she might be described as a rough pyramid or cone of rags, with an extensive base, apparently shaped by the lowest and last-remaining ring of a crinoline petticoat of ancient date, tapering upwards, and terminating above the snow-line of the beautiful white hair in a crushed, shapeless head-covering of greasy black-brown crape and wire. The general colour of the poor woman's costume was that of damp boots robbed of their brightness and defaced with stains.

Such was the person who in this whirligig crowd of beer-and-penny-file-distracted people suddenly informed me that the 'goings on' around us were 'strange, most strange!'

While, like Captain Cuttle, I was 'making a note' of this poor old wreck, she showed me that she had a vocation, or rather plied a trade, for she—dropping the Northeys of Northey Hall for a moment—asked me whether I 'liked them black or red, the round sort or the flammers.'

Her question referred to the boxes of vesuvians which she carried in her hand; and when I told her that I wanted none of either sort, she put her head on one side, loosened with one hand some of her hair, and drawing her fingers through it, asked: 'Did you know the Northeys of Northey Hall?'

I replied that I had not had that honour; whereupon the vendor of vesuvians went on, without any invitation on my part:

'Oh! the Northeys are a good old family, though there ain't many of them left now, for the matter of that. Why, if Miss Caroline had been in the world at this moment, do you think I should be here? No, sir; she would have seen to that. She was very good. And what wonderful eyes she had! Why, sir, when the Squire came down to the dining-room one day, and made a row about a favourite dog of hers that had kept them up half the previous night with his howling, she turned upon him with a look as positively frightened him. Her eyes made every one afraid of her—all except me. To me, she was all gentleness and goodness, and she always looked upon me as a friend. She was the last proper one of the family, sir; for the Squire himself was a nobody. I

\* To be continued in this Journal from time to time.

was with poor Miss Carry from her cradle to her—well, grave, I was going to say, but I mean till the time when she was taken away, and shut up out of sight and out of her mind. I was her maid, sir. And when she disappeared, my real troubles began—troubles which have brought me at last to cigar-lights and the streets. But that is no fault of hers. If she recovered her senses—and it's my opinion that those who should love her best have no wish that she should ever recover them—she'd have me back at the old Hall, and I should once more be, as I was ever so long ago, a respectable woman.'

The crowd had ceased to jig, and was remounting its vans to be carried off to Bethnal Green; the heat seemed more oppressive than ever, and I left the old lady with a wheezy voice and an unfinished history, and returned to town.

A long while after that August night, I again met my cigar-light seller. It was on the topmost height of Pentonville Hill. I stopped her, and asked whether she had heard anything of the Northey family of late.

'No, sir,' she replied. 'I hardly ever hear of them now, and this grieves me much; for, you must know, sir, I was born on the estate. A fine place the house is, sir, but dull—one of those old houses all towers and corners, and ins and outs. Nothing straight about it; no good view to be got of it; no nice long stretch of building, but all broken up like; all broken up, just as the family is—just as I am.'

I noticed that the poor old woman looked ill and wan. Her naturally delicate complexion had become almost ghastly in its pallor, and her knees seemed to bend under the weight of her body, although that, to judge by her emaciated appearance, could not have been great.

She drew her poor thin black shawl tightly round her with a shiver, as an unkind blast of easterly wind came rushing round the corner, and held out her boxes of cigar-lights towards me, as she said: 'Do you want any of these to-night, sir?'

I bought some of her vesuvians, in order to ingratiate myself with the seller of them. Then I asked her to tell me her story, which, stripped of many sighings and ejaculations of woe, was as follows.

She was, as has been already said, born on the estate of the Northeys of Northey Hall, in one of the Eastern Counties. Her father, a small tenant-farmer, died suddenly when she was a mere child. Her mother, she could not remember at all; but she had been told that she ran away with a 'real gentleman,' and so broke her husband's heart. When her father died, she was taken up by the people of the Hall, and appointed to the position of child-companion and maid to 'Miss Caroline.' There was at that time an heir to the name and estate of Northey in the person of 'Master Ralph,' a high-spirited and spoilt boy, the idol of his parents, and the beloved tyrant of all the servants and people about the place. An accident on the lake in the park, when a tiny boat was upset, robbed the family of its hope; and the light of the place went out when little Ralph was brought home one dull October afternoon, 'nigh fifty years ago,' with his long curls dripping dirty water on the hall-stones, and 'death within his eyes.'

From that moment, all seemed to go wrong with

the Northeys. The Squire became harsh and difficult to deal with; My Lady—for she was a lady in her own right—grew 'peaky' and querulous; no company was kept. Year after year went on. The Squire died; My Lady did not long survive him, and Miss Caroline 'came into her own.' She, from injudicious and careless training, had grown into a capricious, albeit beautiful woman. She knew little of men, and she chose a husband most unwisely from the crowd of suitors who came round her seeking, at her expense, name and fortune. She married, and lived for twenty years the life of a dissatisfied and childless wife. Her husband took to ill-treating her. Her health broke down. The doctors were called in; and 'Miss Caroline'—as she was still called by her quondam maid—disappeared.

After the disappearance of the mistress, short work was soon made of the confidential servant. She was told to go about her business; and she went. Her own poor little family had not been without its share of troubles, and had melted away under them. Her efforts to keep herself in the country, failed; her efforts to sustain herself in London were, as I could see, only partially successful; and as a policeman came to move her on, and she shuffled away uncomplainingly, I could not help feeling that the contrast of the beginning of her life in the bright little farmhouse on the estate of the then great and happy family of the Northeys, with its evidently fast-closing chapters on the cruel kerb-stone of a London street, was wonderfully strange and sad.

I saw the cigar-light seller once more. It was in Great Tulton Street, Westminster—a most unholy place. It was very late at night. Her hair was hanging down on each side of her face; her eyes were raining tears; her hands were empty; and her clothing was more scanty than ever. I do not know what the immediate cause of her grief was; she would not tell me; but I stopped her, and asked her where she was going; and she, without recognising me, looked hard at me, brushed the tears from her cheeks with a hard savage rub of her poor withered white hands, set her teeth together, and, apparently without unclenching them, muttered: 'I am going home! Can't you see that? Miss Carry's gone years and years ago, and now my time's come. Don't bother me! What are you staring at? Pray go, and leave me alone!'

And, God help her! I left her alone.

## THE TREASURE AT GRAN QUIVIRA.

### CHAPTER III.

ON the following morning, Gerald duly set out in company with José, after a settlement with Tate, who had at first professed a contemptuous indifference as to whether he received any money or not; more than hinting that he was satisfied to have got rid of his inmate on any terms. Gerald, however, was not to be goaded into a quarrel; and he found, when the critical moment came, that Tate was quite as rapacious as any of the more regular hosts it had been his lot to encounter, whether East or West. After Mr Tate had received payment on a liberal scale, he bluntly asked Elkley to give him his rifle—a request promptly refused. Mr Tate then offered to buy

it. This the young man also declined, adding: 'You would not do it yourself, Mr Tate. You would not travel through the Territory without a rifle, I am sure.'

'Me! Guess I would not. But I reckon there's a difference between a man like me, and a boy that scarcely knows what a rifle is.'

'Don't be too sure of that,' said Elkley, allowing himself a solitary retort. 'I hope you will never, nor any of your friends—presume too much on my ignorance in that way.'

The entrance of José to announce that the wagon was ready, stopped what might have been an angry rejoinder; and the parting moment having arrived, Gerald asked for Miss Annie. To his surprise, he learned she had just ridden off to a ranch some five miles distant, and was not expected home for several hours. Gerald was greatly vexed at this, as he was compelled to leave without saying 'farewell' to the girl, and without assuring her once more how deeply he felt all the kindness, and courage too, she had shown in his behalf.

The wagon started, José driving at a decidedly quicker rate than was customary on that difficult road. He was certainly an excellent Jehu; but Gerald gave him a hint that there was no need of so much hurry.

'I don't seem like feeling sure about that,' said the Mexican. 'Guess the sooner we are out of the cañon, the better for everybody.' So he kept up his speed, and they reached the open country without adventure.

Gerald decided upon remaining at Three Waters City—a collection of about forty houses—until the mail came through on the next day, when he would travel by it to Santa Fé. He did not forget Sy Tate's advice. At Santa Fé, he would meet his friends; and before his arrival there he hoped his foot would be nearly as strong as ever. José was dealt with as liberally as Tate had been, but in a far pleasanter manner. The Mexican, indeed, threw out some distinct intimations of his willingness to take service with the young man; but the latter, although he would have been pleased to secure so trustworthy a follower, thought of Annie Tate, and of the undoubted protection she must find in the Mexican's presence; so he did not encourage the idea.

He reached Santa Fé in safety, and found his friends already there, with the preparations for their excursion already well advanced. They had provided saddle-horses for themselves and their six assistants. We may not say servants, as three of them were United States' citizens, who reject the appellation; the others were Mexicans. In addition to these, two men had already started with a wagon fitted for the carriage of water-casks. These *avant-couriers* were to meet them with their load at Gran Quivira; and afterwards to keep travelling between the Gallinas Springs and the ruins, or such other spot as should be chosen for their operations. These springs were about twenty miles from Gran Quivira itself. They had also provided several wagons laden with blankets, buffalo robes, provisions, mining tools, and the like; and it need scarcely be said that every man was fully armed with rifle and revolver.

A great sensation was created in the city by the expedition. A few of the more adventurous spirits offered to join them on the condition that

their expenses were paid; but the majority ridiculed the idea. Not that they doubted the existence of the treasure—nobody doubted *that*; but they doubted the possibility of discovering it. Several of the residents had before joined in parties for the same purpose, and they were unanimous in opining that the absence of all signs and landmarks, with the extent and vagueness of the ruins, made the attempt hopeless. They and others had dug in every possible foot of ground in the ruins proper, unavailingly. No one knew how far the monastic gardens or fields might have extended, and therefore they saw no great hope of a favourable result.

In spite of all these sinister forebodings, the party started, Gerald now riding one of the horses, and suffering but little from the weakness of his foot. All went well. The weather was delightful, so that 'camping-out' was a treat, not a privation. The ruins were reached, and the water-bearers were there already. Great was the astonishment of these latter, and of the six hired assistants, to find the party push on for several hours after their supposed goal was reached. As mile after mile was traversed, the astonishment of the staff increased; and when about sundown, the cortege came to a halt in the shade of a *mesa*, or low flat hill, and it was announced that this was their destination, their surprise broke out in muttered sarcasms.

The bustle of getting supper, tethering the horses, and the like, soon occupied the assistants too much to admit of much discussion; and while they were so engaged, the principals sauntered, aimlessly enough, to all appearance, to a spot some third of a mile from the camp, where a ravine of no great length separated two *mesas*; and in which they were completely screened from observation. Their decision would of course become known to their assistants; but some of the latter were too quick-witted to be intrusted with all the information and details that led to a decision which might—most probably would—have to be changed. One of the party produced a rough sketch-map, with notes and landmarks, round which the others crowded.

'This is the place, I make no question,' said Gerald, after a while. 'This is what he meant by "a gulch;" for here are the two *mesas*, which are now, however, quite separated. Yonder is the hollow covered with bushes; and exactly in a line with the northern points of the *mesas*, we sight the peak of that distant mountain.'

'Right! Elkley,' said one of the party. 'Then fifty paces from the mouth of this ravine must have been the boundary-wall of the chapel. If so, and we can decide exactly where it was, we can easily fix on the centre, as we know the dimensions of the building, and so ought to be able to find the treasure with little trouble.'

Some more discussion, with a further examination of the maps, ended in a unanimous assent to these views; and there being still light enough for the purpose, three members of the party separately stepped the distance in the directions they respectively thought most in accordance with their instructions. Although, speaking broadly, they took the same course, yet they diverged a little; and the remainder, who had watched them, gathered round to decide which was most likely to be the correct point.

At last it was agreed that the centre of a small square bounded by *arroyos*—or water-courses which are dry, save in times of floods—must have been the site of the chapel. Floods soon cut for themselves the requisite channels in the soft soil of New Mexico; but, as a matter of course, if they find channels ready made, they will follow them; and there was a regularity in these *arroyos*, which seemed to mark their origin as from the hand of man, rather than from chance. They might have been used for irrigation, especially if—as was asserted—a stream had once existed in the vicinity. At anyrate, the decision was come to—a spadeful of earth thrown out to mark the spot; and then the party, in high glee at finding their information verified so far, returned to the camp, where a savoury odour of fried buffalo-meat and hot coffee intimated that supper was prepared. The men were equally glad to know that all was well, and that digging would commence in earnest on the next day; for, in addition to their liberal wages, each expected a bonus in the event of success; and master and man took glasses of whisky together in celebration of so auspicious a beginning.

As all were experienced 'campers,' their arrangements, even on this first night, were almost complete. Tents were fixed, the wagons drawn up as a fence, watches arranged, and every precaution taken to prevent a surprise of the camp by any of the dangerous hangers-on to frontier society who abound in New Mexico. These were more to be feared than the Indians, who usually get the credit of such deeds.

The next day, operations were actively commenced, several holes being made at the same time. For any sign which appeared to the contrary, the earth there might have lain undisturbed from the day on which the sea, which must once have covered it, had rolled away on its upheaval. But the party were not to be daunted. They intended to dig, and deeply too, in fifty places if necessary, until they had thoroughly explored the whole of the area in which it seemed possible the treasures might be; so, although no trace of the prize was obtained on this first day, they were in excellent spirits.

The wagon had left for a fresh supply of water, and one of the hired men having climbed to the top of the *mesa*—for work was closed for the day—was watching the slow progress of the vehicle, as it grew more and more indistinct on the far-stretching plain, when, turning his glance in another direction, he uttered an exclamation of surprise, if not of alarm, which at once drew the attention of those beneath him.

'What is the matter, Bob?' cried one of them.

'Matter!' returned the man; 'why, here's a mule wagon right close on us, and we never saw it; and as I'm a living sinner, it's full of women!'

At this, every man sprang to his feet; for most of the party had been lolling on the dry grass, lazily waiting the call to supper, and looked eagerly in the direction indicated by the lookout. There, sure enough, was a wagon, within half a mile of them, and clearly making straight for their encampment. Sure enough too, if not quite filled with women, it contained two, with two men. One of the latter, the driver, made signals to the party when he saw they were

observed. The vehicle being forced to make a circuitous approach, owing to the deep *arroyos*, there was sufficient time for speculation in the camp as to the errand of the new-comers; and it was decided that the strangers must be interlopers, who were resolved to have a share in the at length discovered treasures of Gran Quivira. Yet why women? Such a thing was never heard of before.

Gerald had been as ready with his conjectures as any of the party, and was speaking at the moment when the wagon turned a curve of the last *arroyo*, and so could be driven straight in. As this happened, he abruptly ceased in his speech, and stared at the approaching visitors with an astonishment exceeding tenfold his previous surprise. The driver was his Mexican nurse José of Blue Creek! And José had seen and recognised him, and was waving his broad hat in recognition; while the women were now so close that he could see one of them was smiling, yet looking somewhat confused; close enough to recognise her dark, resolute eye, and the clear though bronzed cheek—close enough to see and know her to be Annie Tate!

His first feeling was one of embarrassment, instantly succeeded by a conviction that the visit heralded some serious revelation; and in this he was not entirely mistaken. As the wagon drew up to where the explorers were gathered, the utmost surprise was exhibited by the party at seeing first José, then Annie, leap from the vehicle, and shake hands with Gerald, as with an old friend. All looked at him for an explanation, of which, truth to say, he was as much in need as any of them. Pulling himself together, Gerald introduced Annie and José to his comrades; and then the former, like the fearless huntress she looked, and really was, in her turn unflinchingly introduced her companions, who were, she said, 'Mr Jonathan Sanny and lady from Blue Creek. Yes; Mr Sanny had concluded to leave his location; and hearing of their party as being on the prospect in Socorro County, had also concluded to join them. That is so.'

Mr Sanny at this left the wagon, as did his better-half, and each of them shook hands all round. With every desire to be friendly with those who were friends of Gerald Elkley—who was certainly looked upon as in some respects the leader of the expedition—and to give them welcome, it was nevertheless impossible not to feel that they were intruders, poachers in a sense, and that their arrival was anything but welcome. They might have tolerated Annie, who was young and handsome; but Mr Jonathan Sanny was a buckskin-clad, tobacco-chewing drover in appearance; while his lady, Mrs Sanny, was a hard-featured, camp-followerish sort of woman, in no degree attractive.

'I am afraid we have not arranged for a water-supply sufficient to include any strangers,' Mr Elkley, said one of the party, deeming this the most politic way of introducing an objection to their presence; 'you know we are on short allowance as it is.'

'That don't signify an item, Cunnel,' said Mr Sanny. 'We have a full cask in the wagon; and I reckon we know how to provide ourselves in the wilderness, as well as any people in these diggin's.'

'Mr Elkley, and you gentlemen,' interposed Annie, 'I have travelled under the escort of Mr Sanny and his lady, on purpose to join you. I don't estimate you will find any gold or silver; but we may be of some help for all that, we—Mr Elkley!' she said, with an abrupt change of tone, 'you have known me, and I hope you can trust me. Believe me when I say that the treasures have not brought us here; and that my friends from Blue Creek are honest and true friends, who have come at my desire.'

There was something in the girl's earnestness which carried conviction to her listeners. They were all young men, and easily impressed by such a girl; so that the previous spokesman declared that they were welcome, and should be so, as long as they chose to stay.

The reply to this was practical, but prosaic. 'Then,' returned the girl, 'we had better see after our fixings for the night.'

An immediate offer of help was made; and supper being announced, an invitation to join in the meal was given and accepted; Annie being at once recognised as a kind of prairie belle, and every one being anxious to help, or at any rate to converse with her.

José, who smiled his approval at the turn events had taken, followed in silence until he found himself by the side of Gerald. 'Let me tell you something, Señor Elkley,' said he, in a hurried whisper. 'I suppose Señorita Annie not like to tell everybody. Come behind this wagon.'

Gerald obeyed, and stepped to a spot where the Mexican and he were hidden from the remainder of the party.

'Now you sabe very well,' continued José in the same hurried whisper ('you sabe' being commonly used in the Territory for 'you know'), 'Señorita Annie no good friend with Señor Sy Tate. He hate her, and much 'fraid of her. She hate him, but not 'fraid of him one bit. I think he let Injuns kill her mother and rob the ranch. He save Annie because she his son's papoose. Old Pablo tell her all about it when he get drunk; and so she hate Sy Tate. *Esta bastante*, that quite enough. After you gone, two three dog-garned desperadoes come in, so did them loafing Injuns; and all have secret talk with Sy Tate. Not in the shanty; not indoors—no! He been white Injun, and too cunning for that; but Annie guess, and me guess too, there mucho mischief going on. I bet my sweet life if you not have gone so early that day, and me not have drive so fast, you never get out of cañon at all. Some of these scallywags up at creek before I get back from Three Waters. Señorita Annie tell me all about them, and I see lot more come in day or two. Well, Señor, I know one desperado very well—Squinting Bill, of Deadman's Ranch, where the murders was—and I make him drunk. You never see one man drink so much whisky before him drunk, as Dick!—and then he not say much, and so 'cute, I not dare to ask him much; but he tell me something. But Señorita Annie!—she is the wonder! She have eyes and ears quicker than mountain lion; step as light as Injun; can hide like snake; and she go after Sy Tate and them scallywags. She overhear lot—everything! I think, when she tell me, what would happen if Sy Tate had find her! I think

she shoot him; for she is grand shot with pistol, and she hate him. But we learn quite enough. Old Sy Tate has been trying for this treasure for years, and has been digging at Gran Quivira every fall this long time. He think he know where the right place is, after all; and he almost crazy to think you and your pardners have made up mind to stop here till you get it. He die first, he swear. So he set off next morning, say he going for two weeks' hunt. *We* know where he going. So Señorita Annie go and tell old man Sanny and Señora Sanny. The Señora mucho good woman; you like her when you know her. Both of them love Señorita Annie, and die for her. Señorita Annie she declare she will ride all way to Gran Quivira by herself, to warn you of attack on your camp. It will be attacked, that sure, and every one murdered, by old Sy Tate and his desperadoes. She say so; and she do it, Señor Elkley. Señora Sanny she say directly, she go too; so does old man Sanny; and of course José fight like death for Señorita Annie. That's why we come, Señor; and you can tell Señorita Annie you know all about it, as she perhaps feel awkward. Have plenty good guard to-night. I bring Bodon my big dog with me, as I think you wouldn't have no dogs; he soon tell if any fellow loafing about near camp. But, Señor, don't tell your helps what you know; keep quiet with them.'

Elkley was completely dumfounded by this hurried revelation. He was convinced that every syllable was true; yet, appalling as it was, close and terrible as might be the danger, all other feeling was at first overwhelmed in admiration of and gratitude to Annie Tate, whose courage and energy had probably saved his life and the lives of all who were with him. He hastened to the headquarters, where his absence had already occasioned some wonder, and to which Annie and her friends had just returned, after, it is presumed, seeing to their 'fixings.'

She looked up as Elkley joined the group, and the expression of his eye told that he knew all. Annie's own lashes drooped, although her eyes were as fearless as any in that company, while her brown cheek glowed with a deeper hue. Gerald took a seat which placed him between the girl and Mrs Sanny; and before he spoke to the former, shook the good lady's hand warmly, and expressed his gratitude to her in a few words. It took him longer to convey his thanks to Annie, who was a good deal embarrassed at hearing them, exhibiting less self-possession than might have been expected from such a heroine.

In accordance with José's caution, Gerald spoke privately to each one of the party; who all regarded the intelligence as ominous, and who all sought Annie to thank her, adding greatly to the confusion of that young lady. The staff could of course see that something fresh and important was afoot; but from their inquiries, and from the remarks in which they indulged quite as freely as their employers, they evidently imagined that the new-comers had brought some information as to the true site of the chapel.

Fresh arrangements for watching seemed to grow naturally out of the increase in their numbers, and no suspicion was raised by the change. Yet, as Gerald was about to lie down in his tent for the night—he had taken his watch on the first

evening—José made his appearance, and in his previous mysterious manner, whispered: 'Señor Elkley, I not like your Mesicans'—that being his pronunciation of the word—'not all of them, anyway. That fellow with the yellow belt—you sabe which one I mean?—he is bad one. I think he know too much. You keep good eye on him to-morrow. If I see anything wrong with that Mesican, I set Dodon on him; he never play any more tricks then.'

## RAMBLING HINTS.

BY AN OLD PEDESTRIAN.

To those persons who are content to renounce the showy splendours of Scarborough or Bournemouth for the healthy pleasure of a country walk, and who can be induced to believe that, even in late Autumn, there is plenty to be done and seen in Derbyshire or Cornwall, without going to Norway or Switzerland—to such, a few suggestions from an old Rambler among our English hills and valleys may not be unreasonable; for to walk is in nearly every one's power; but to walk with pleasure, and to the best advantage, is not an art which all possess.

The first preliminary to be insisted on is, not to start on an expedition without being thoroughly well shod; that is, both strongly and comfortably too; otherwise, one's walking will be short and painful; for if the feet are worn out with undue friction, it matters little how sound a man may be in every other point, he cannot walk. A light waterproof and a fairly strong stick are also desirable; the one to remove uneasiness about the state of the weather; and the other for a variety of purposes, offensive and defensive. It is very necessary, too, to provide a really good map; the best is the Reduced Ordnance Map in shilling squares on the scale of an inch to the mile. The full-sized Ordnance is too large to be spread out well in the open air, and the small one is as exact as can be needed.

A guide-book, too, is not a bad thing, though somewhat cumbersome to carry about; and it would be of much greater use than it is, were it not for the tendency of most guide-writers to magnify each charm absurdly, and speak with a misleading profusion of praise which renders a choice quite embarrassing. This is especially the case with small local treatises, whose descriptions have to be discounted largely, if we would avoid disappointment.

It is well before starting not to forget to fill one's purse, and that with metallic currency—not paper; and also to take some light food, unless the country is certain to be well supplied. The neglect of these two things has often led the writer into more or less trouble. People who don't know you, can't be expected to trust you; and as to cheques and notes, many country-people have a lurking suspicion of such things, a suspicion not altogether unreasonable. In Scotland, the one-pound bank-note is another matter, being in many places preferred to a sovereign! And with regard to food, a district often proves much more deserted than was expected; and though we all know that country hospitality is a hearty and an excellent thing, yet it will not do to trust too much to it; though I have often found that, like the prophetic powers of the gipsy race, it was wonderfully quick-

ened by the sight of silver. For instance, on one occasion two of us were wandering among some of the wildest of the Yorkshire hills. We had taken no provisions, supposing that it would of course be easy to purchase what we wanted, and now looked in vain for a dwelling of any kind. After becoming nearly faint for want of food, we descried at some distance a small farmhouse; and to it we made our way with energy, and in hope of a Yorkshire welcome. The 'Yorkshire' welcome consisted of a fierce dog, and after the dog a man hardly more inviting, who answered our knock, and in the language of the country, which I need not render, asked roughly what our business was; and being told, gave us civilly to understand that his house wasn't an inn. He was shutting his door in our faces, like Goldsmith's 'rude Carinthian boor,' when, rendered desperate, we exclaimed that something we must have, and added a word or two about payment. This last consideration seemed to make a difference, and to penetrate his stern and cloudy mind with success; and though it was certainly more inn-like to sell provisions than to give them, yet he rapidly thawed; and after regaling us with what he had, was pleased to consume a little of our tobacco in token of amity, ere he sped us on our way.

And now, after making such preparations as these with what care he can, our tourist may be allowed to start, with light heart and, if possible, light knapsack. In starting, however, it is wise to avoid the mistake of beginners—excess of eagerness and hurry to get forward. Old Alpine men always walk slowly at first; so much so, that one might fancy their powers of locomotion were small and would soon fail; but after twenty miles or so, matters look very different. One can easily keep up a good speed for a considerable time, if only it is attained gradually; and the same may be observed of a horse in a long drive. But if a walker attempts to begin at full swing at once, and tries to keep it up long, he is apt to tire himself prematurely, or strain some small muscle, which may practically lay him up till the morrow.

As a matter of fact, there need be no sort of hurry. The things which waste time are, not a moderate pace or a gradual start, but sauntering and wasting time on trifles, stopping often for rest, being drawn aside by unforeseen attractions, and above all, losing one's way. Of these, the habit mentioned first, of making fitful and desultory pauses without any solid cause at all, deserves to be condemned unconditionally. But the question of stopping for rest must depend on the walker's state of training. At first—that is, for two or three days—it may be advisable to pause for a few minutes every two miles or so; but afterwards this is not necessary. For meals, which of course involve necessary stoppages, I almost think the best way is to have a substantial breakfast, and then only to take light refreshment, though not at very distant intervals, until the day's work is done, when a solid tea, such as country inns generally understand better than dinner, is most enjoyable.

As to digressions, another source of delay, it is hard to avoid them altogether, if one is of a curious and enterprising turn; only, in undertaking them one should count the cost in time, distance, and energy, which is apt to be con-

siderable, and allow a corresponding margin beforehand. Above all, beware of a digression from the beaten track simply to save distance, for such attempts are generally failures, resulting from ignorance of the locality; and end by wasting a great deal of time. But the greatest loss of time and energy is caused by missing the way, for then it is often necessary to grudgingly retrace one's steps. The power of finding one's way easily and well is apparently a sort of instinct that some persons are almost destitute of; but to remedy the want, let the walker have recourse to his map, and look often at it, constantly comparing with it the landmarks of the surrounding country, the hills, watercourses, and even houses. By so doing, he need never allow himself to lose his place, and will know where he is as well as any one can tell him.

It will not in general be wise to reckon on doing the total distance for the day at an average pace of more than two or two and a half miles an hour, stoppages and all included; that is, if enjoyment is an object. To try to go too far in a day is a mistake, which springs sometimes from a wish to make the day's work sound well in the telling, and sometimes from a mistaken estimate of what is 'the correct thing.' The writer remembers acting on the opposite or more philosophical principle, in company with an entertaining but not very muscular friend; so much so indeed, that we laid ourselves open to the taunt, on recounting our exploits to my friend's sister, that it was 'more a *talking* than a *walking* tour.' This was severe; but perhaps we had run into the other extreme, and degenerated into mere laziness.

The perplexity caused by puffing guide-books we have already noticed; but even this is better than the utter bewilderment which results from relying on the accounts of the inhabitants themselves of a district. Strange to say, they are in but too many instances the last people to tell you what you want to know, even if they can understand what it is that you want. I remember dragging my good-natured cousin up a valley called Bishopdale, to explore a fine waterfall which I had heard was there, but which he, a resident of a few miles off, knew nothing of, and did not believe in at all. The only result of my inquiries at a village some three miles away was to strengthen his incredulity; and my own confidence was inwardly impaired. None of the rustics seemed to know even what I meant by the term 'waterfall,' and to be thinking about quite other things; until, upon my seizing the village pump-handle, and pouring out a torrent by way of illustration, a little girl pointed to what proved the right direction; and a very fine fall we discovered eventually, though after much open scepticism on the part of my companion, and not before I had been compelled, Columbus-like, to promise that if nothing was met with in the next ten minutes, we would turn back.

Nor are the inhabitants of a place more reliable in the matter of distances; there, again, you must trust to your map, adding some little to the apparent distance for deviations of the path. It has happened to me, on asking three separate wayfarers, at intervals of a few minutes, how far it was to the next village, to be told consecutively that the distance was three, four, and four and a

half miles; so that one might have felt inclined to turn round and walk the other way. This is bad enough. But when a man gravely tells one, as was the case lately in Scotland, that the place where you stand is 'about two miles fra *all* places'—as though we were at a kind of centre, with the rest of the world all round us—one begins to realise the hopelessness of further inquiry. Indeed, the rustic mind has a special aptitude for eluding all exact questioning of every kind. In the matter of distances, the aforesaid rustic fences with and evades the questioner by saying it is 'no that far,' or 'a guid bit,' or even occasionally by a direct untruth, prompted, it would seem, by no motive but the dislike of precision and exactness.

To get a really fine and comprehensive view of the country one visits, it is far the best course to make one's way along the tops of the hills. But there are great drawbacks: the walking is of course much slower and harder; the danger and delay arising from bogs and quagmires are annoying; and in dry seasons, the want of drinkable water, apparently but not really in contradiction to this last statement, is sometimes quite distressing, and makes one realise the condition of Addison's wanderer, who 'on the thirsty mountain pants.' But yet if you want really great scenery, as opposed to small and pretty views, go along the hill-tops; and carry with you a flask of cold unsugared tea, which will be found a most refreshing drink.

In concluding, I may remark that there is no possible chance of such walking as I have described proving attractive, except to a genuine lover of natural beauty. If the pedestrian only looks at natural objects as the American did, who exclaimed at sight of Niagara, 'What a deal of mill-power is wasted there,' then he might as well stay at home, and do his walking about his own doors.

#### A GIRL'S SELF-SACRIFICE.

THE links are golden, yet for ever fret  
With keen if secret pain;  
Nor does the metal they are fashioned of  
Make them the less—a chain.

This bridal home, a splendid prison seems;  
To me, its loveliness  
Is but the bitter sign of servitude,  
And mocks my heart's distress.

Ay! Gold is powerful in this world of ours;  
What magic in its gleam!  
'Tis well that there are things it cannot buy,  
Else it had reigned supreme!

Sweet Sister mine, you think I have done well;  
You love this pomp and pride:  
Alas! I find it but a poor reward  
For all I cast aside.

I dare not think of all the vanished Past.—  
Hush! let the dead love rest:  
But, Sister mine, remember all your life,  
Remember, *Love is best*.

And I am not entirely comfortless;  
One joy is mine the while:  
My father smiles again, with free glad heart,  
And I have bought that smile!      E. K. W.

## POETICAL JUSTICE.

THERE has never been any question as to the importance of the enormous influence exercised on mankind by that most powerful moral agent Fiction. The expedient of teaching deep truths by means of simple stories, concealing grave lessons in the attractive interest of parables, or the thin disguise of fables, is a very ancient one, and was probably in full force in the world before Jotham intimated to the murderous citizens of Shechem his contemptuous disapproval of their choice of a ruler, under cloak of the parable of the trees seeking a king to reign over them. Its popularity since those days abundantly testifies to its efficacy.

The causes of this popularity may be variously assigned; but certain it is that all men, and still more all women, are more or less open to the influence which Fiction exerts; and never was it more strongly felt than in the rush and bustle of this crowded nineteenth century. Not only do the rich and idle find it agreeable to while away their leisure in the languid amusement of contemplating pains and pleasures that do not disturb their own easy lives, but the energetic and hard-working, the overworked and the despairing, find their best relaxation and their most wholesome tonic in that blessed forgetfulness of self, that temporary oblivion of the one engrossing and intrinsically subject, which a hearty interest in either a play or a novel gives. Travel, sport, society are most valuable as distractions from sordid cares and the pressure of business; but for the many to whom these are unavailing when most needed, a fair substitute is obtained in the books or the plays that enable them to accompany others in their voyages round the world or through life, to see with their eyes and feel with their hearts, and so cast off for a time the crushing burden of self and selfish cares.

The importance of the nature of the lessons conveyed by means so universally accepted can hardly be over-estimated, and Poetical Justice has much to answer for under this head. It may be

true that novels are generally read and plays witnessed for the sake of amusement only, that no one expects to learn from them, or desires anything beyond a pleasant mode of passing time. Nevertheless, the influence is there, working stealthily, and whether recognised or not. Not more surely does the hidden violet fill the air around its modest presence with perfume, than the spirit in which a book is written makes itself felt for good or for evil. A young man's mind and character are formed by the books he reads, even more than by the company he keeps; and of the books he reads, a large proportion will be works of fiction. This may be predicated with even greater certainty of the young woman. Children are nurtured on fiction from their earliest years, soothed and amused with 'stories,' and induced to swallow the pills of educational instruction by the silverying of romance with which they are now elaborately coated. The taste grows with their years; and for a man or woman of average experience to show no appreciation of Scott or Dickens, of Thackeray or George Eliot, would be to declare him or her either wanting in intelligence, or utterly and grossly self-absorbed.

The appreciation of fiction which we should look for with most confidence amongst the masses is independent of that discriminating admiration for the beauty of artistic work, as such, which is the special privilege of the intellectual connoisseur; it is the simpler and commoner interest in a well-told story, to which no sane head and sound heart can be quite insensible. The spurious delights of studying highly spiced records of immorality for the sake of the excitement they afford, may be left out of count here, as a disease of the mental organs; we are only concerned with their healthy and normal conditions.

The novelist's strength lies in his power of appeal to our sense of truth. In this, as in other arts, the highest art is the concealment of art. If he presents us with characters that we can recognise, we love or hate them as the case may be. We love the simple nobility of Colonel Newcome, loathe the monster Quilp, and

worship the sanctity of Dinah Morris; we laugh with the witty, and fight with the brave, and mourn with the bereaved. But to touch us, the persons must be real; we care little for the adventures of figures of wood, and are unmoved by tragedies enacted by bundles of straw. And this is the common failing of our minor novelists. They introduce us to beings we have never known, men and women who walk on stilts and speak a language we have never heard, who move with the jerky unaccountability of marionnettes, and smile with the vacant stare of a Saracen's Head. We feel no inclination to join their unfamiliar dance, and our answering smiles are chilled at birth by the grim stiffness of their stony lips. But this is the fault of the artist. Let the magic spark of truth be present, and the glow of sympathetic interest will be kindled in every breast. And it is generally in favour of the ogre Poetical Justice that delineation of character is so sacrificed to management of situation as to make this sympathy impossible. Some righting of the wrongs we have witnessed is of course demanded. We go through labyrinths of misery with our friend the persecuted heroine, and endure a lengthy and intimate acquaintance with the iniquitous plots of the villain, on the tacit understanding that Poetical Justice is at last to step in and put everything straight.

But the Poetical Justice we generally come to at the end of the third volume or the fifth act is, nevertheless for the most part untrue to our own convictions, and its arrival but too frequently alienates us more than all the previous eccentricities of the performers. It is not real justice, not the natural working out of that law of compensation which does in great measure restore the balance of the deranged affairs of this complicated world; but an arbitrary arrangement of circumstances, which vexes us by its insufficiency, and offends us by its wild improbability. We know that in our experience of daily life the hypocrite and the impostor flourish on the fat of the land, humble virtue remains unrecognised, and no god steps out of the machine in the nick of time to convict the culprit and rescue the deserving. Such violent adjustments seldom happen; but a quicker and much more true adjustment, in the full sense of the term, is daily taking place. The patient heroine does not invariably marry her lover after years of struggle, and the endurance of every possible and impossible hardship that can beset Love's course; and if she did, his irritable temper and disappointment at her faded appearance, would render the event but a poor return for her courage. Her true reward is the elevation of her own moral nature, the development by this rough education of all the graces of her heart, and the purification of that fine gold of the spirit which we trust is to survive the existences of time and sense. In real life the cruel relative does not fall dead on the threshold of the home he has robbed from those who trusted

in him; he lives and revels in it, widely respected for his liberal charities; but retribution attends him not the less truly in the deterioration of his nature, the blunting of his sense of honour, that entire moral degradation unflinchingly induced by successful fraud. Again, he whom he has ousted accepts or does not accept the discipline of his fate, and becomes either the discontented trifler, or the strong and noble soul whom afflictions can but confirm.

Far from disparaging the ingenuity required for the dovetailing of incidents in a complicated plot, we heartily commend it; but we would plead for an occasional change in the application of it. Let the lesson conveyed be that a man's condition can only be truly estimated by his moral nature; that the Nemesis we all admit to be indispensable is carried about in his own breast, and is independent of accidents of circumstance and change; that worldly prosperity is an inadequate reward, if he has lacked that true nobility of character which is implied by the words self-help. The varied and subtle effects of these outward accidental influences on the character he deals with, will afford large scope to the author both for the study and practice of the higher branches of his art; and if they lead him from the composition of 'sensation novels,' to efforts after a refined and analytical portraiture of human nature, his readers will be gainers of truth and of pleasure in the exact ratio of his success.

## THE FORTUNES OF BERTRAM OAKLEY.

### CHAPTER XLV.—IN THE OLD COUNTING-HOUSE.

'MR MERVYN expects you, I know, Mr Oakley. If you will kindly wait'— And, without finishing the sentence, the young clerk stirred the steady fire into a brighter glow, and went out, leaving Bertram alone.

Bertram looked around him, every object on which his eyes fell serving to awaken a train of recollections. There were the books on their shelves. There were the models on their cases, as of yore. Again he stood within the walls of the old counting-house at Blackwall, where he had first entered in the humble character of a messenger from his then employers, Groby, Sleather, and Stodge. That blatant firm, that image of burnished brass, had toppled over from its feet of clay, long ago; and here was Bertram again—summoned, this time, by special telegram from Mr Mervyn the principal. Arthur Lynn had dropped no hint concerning his uncle's motive in desiring to see Bertram at Blackwall.

It was winter now. Months had elapsed since the adventure in Mervyn's Yard at Southampton, and the tall trees of the Avenue were bare of leaves, and red berries were on the hedges, that in summer had been gay with the white wild-rose and the May-blossom, and early snow lay on the Surrey uplands past which Bertram had that day journeyed. The time had not been idly spent. Bertram had worked with a will in carrying out that extension of the business which had been designed

before his first promotion to a place of trust; and Arthur Lynn, who was very often at Southampton in these latter days, and who was thought to have found favour in the eyes of Mr Weston's beautiful ward, was eloquent in praise of the Assistant Manager. His very leisure was more profitably spent than are the hours of labour of those less gifted than himself. Two of his patented inventions already brought in a considerable income. For a third, he had refused the proffer of a large sum pressed on him by some wide-awake speculator, declining, at about the same time, a proposal to undertake the management of some works, on a great scale, in Russia.

Bertram, as his eyes ranged over the lettered backs of the volumes—old friends, many of them—on the shipbuilder's well-stored shelves, and as he glanced at the models, his interest in which had first of all attracted towards himself the notice of Mr Mervyn, smiled somewhat sadly as he remembered his own painful pilgrimage, on weary feet, worn by the churlish pavement of inhospitable London, past the Docks and Warehouses and Factories of the East End, before some happy inspiration had led him to turn his steps to Blackwall. He could recollect the bitter weather, the sinking of the heart, the physical exhaustion, and finally, how he had sunk down helpless, like some over-driven creature, at the gate of Mervyn's Yard. How had the world changed for him since then!

So deep was Bertram's reverie, that he was only aroused from it by the pressure of a friendly hand upon his shoulder; and he turned to find himself face to face with Mr Mervyn, as on that first day of our acquaintance with which his thoughts had been busy.

'You will consider me a sad dreamer, sir, I fear,' said Bertram, with his bright smile, as he took his patron's proffered hand. 'The sight of old friends—dumb ones though they be—sent my thoughts far back into the past. It was a turning-point in my life, Mr Mervyn, when first my good genius guided my steps to this place.'

'It was a piece of good fortune to us all,' replied the great shipbuilder cordially. 'But sit down, sit down,' he added, motioning Bertram to a chair near the fireside, and taking another himself. 'You wonder, do you not, Bertram, why I sent to ask you to come to me, without assigning a reason? Well, the reason lies in a nutshell. We contemplate making changes, great changes.'

'Indeed, sir,' said Bertram, turning his handsome, thoughtful face towards the speaker, and waiting to hear more. The manner in which this communication was made puzzled him. Mr Mervyn was not often oracular. When business was in question, and indeed, whatever was the topic, he usually spoke plainly and to the point. But now his kind old eyes twinkled, as though in enjoyment of the riddle he had propounded for Bertram to guess.

'Or rather, one great change,' Mr Mervyn went on to say, 'the idea of which is, as yet, a secret between my nephew and myself. Arthur did not drop any hint, did he, when you told him you were coming up Londonwards to-day?'

'No,' answered Bertram, looking more attentively at the principal than before. 'Mr Lynn said nothing worth repeating, when I told him of your wish to see me here.'

'Sly dog!' said Mr Mervyn, with a beaming smile. 'He did not say, either, that he should see you presently? But of course not. This, you must know, Bertram, is a little surprise of my own planning. I spoke of a change. We project one; but it cannot take place, of course, without your co-operation and consent.'

'Without my'—Bertram got thus far in his inquiry, and then broke down. His breath came quicker than before, and his anxious look moved his kind old friend to shorten the explanation.

'Yes,' said the shipbuilder; 'the firm, you see, which my own father founded, and which has grown and thriven these fifty years—about the time it takes to get a navy oak into condition—has been hitherto known as that of Mervyn & Co. We think it would sound better, in future, as Mervyn, Lynn, and Oakley. Here are the articles of partnership, or rather, the draft of them, ready for amendments,' said the old gentleman quickly, as he unlocked a safe; 'and here are the books—you had better look at them, and see the balances, and observe what we divided last year, and this—mustn't buy a pig in a poke, you know!' added Mr Mervyn, who seemed to continue talking to allow his auditor time to recover from the shock of the first surprise.

'Have I heard you rightly, sir? Is it possible that you would consent—would wish—to receive me as a partner in the House?' asked Bertram, pale, and almost incredulous. Such a thing seemed out of all probability. There are firms in which a clever subaltern may reasonably hope, after years of good service, to be taken up into the commercial Olympus. There are others in which it seems as unlikely as for a Sudra to receive the sacred thread and yellow paint streak of a Brahmin. And in Mervyn's—that grand old House—no such promotion had ever yet been granted. Yet Mr Mervyn stood smiling, and pointed to the Deed of Copartnership, whereon Bertram's name was inscribed.

'But, sir,' said Bertram, astonished—'surely the want of capital sufficient to—'

'You have it, my young friend,' interrupted the principal cheerily, as he tapped Bertram lightly on the forehead with an outstretched finger—'you have it there! You have not been long with us yet; but we have learned to regard you as the right hand of the firm. It is but fitting that you should be one of us, should share in our counsels and in our profits. You do not come to us empty-handed—far from it. Your first two patents, which, if you agree, will be joint property, represent much money; and for every ten thousand pounds you can invest, your portion of our gains, as you will see here, will increase in gradation. You have money now, I think!'

'I have laid by a considerable sum,' said Bertram, still bewildered; 'and more, I believe, may be expected in two months' time. Hitherto, I have not known what to do with the profits that my patents have brought in; but now—'

'Use them!' chimed in Mr Mervyn pleasantly. 'People make a great mistake, it seems to me, as to money. Money is a tool, an instrument, an engine—not a toy, as our young dandies think, to be played with and flung away—not a meal

to be greedily devoured, according to the creed of our poor, brawny shipwrights, children with mighty muscles, whose high wages do not last out the week. No, no; the Dutch were our masters in the art of productive saving—no cash in a stocking, but all out on the sea, or in tilling the land, or gathering rich crops in the Spice Islands of the East; or rolling over, like a golden snowball that agglomerates gold, as common snowballs grow heavy with gathered snow, on every mart and bourse in Europe. I know poor men with great territorial fortunes, and rich men whose revenue is small; for to live up to your income, is to lead, after all, a hand-to-mouth existence, as the savages do. Come; you must dine with me to-day, in Park Lane—you have never broken bread with me yet. Arthur will be there. He is coming up on purpose,' said the old man kindly; 'for we, of Mervyn's House, do not receive a new partner every day; and this, Bertram, will be a fresh start in life for you.'

'I have no words to thank you, sir,' was the simple but heartfelt reply.

(To be continued.)

#### ANECDOTES OF THE AMERICAN STAGE.

WHEN Charles Webb was starring it at the old Chatham Theatre in New York, he became acquainted with a fish-dealer named Thomas Shapleigh, who had in his boyish days belonged to a juvenile dramatic company, and felt very much inclined to tread the boards again, if a chance offered. It did offer. The actor cast for Polonius on Webb's benefit night was unable to play, and Shapleigh undertook to supply his place. The house was packed; and the beneficiare, and the friend who had, as the bill put it, 'magnanimously volunteered his valuable services,' were received with loud acclamations. The first act went off smoothly enough; but in the second, when on Polonius asking, 'Do you know me, my lord?' Hamlet replies, 'Excellent well; you are a fishmonger'—Mrs Shapleigh, sitting in a front box, exclaimed: 'Well, it ain't very pretty of you, Mr Webb, after Tom has been so good to you, to go showing him up in that way; I'd have you know that a fishmonger, as you call him, is as good as an actor any day!' When she ceased, a wondering silence fell upon the audience; and Shapleigh giving his wife an assuring nod, said: 'It's all right, Bessie; it's so in the book.' And then, understanding matters, the audience vociferously applauded.

It is not always 'so in the book.' It was not Shakespeare's Romeo that electrified a Western audience with:

Soft! what light through yonder window breaks?  
It is the east, and Juliet has a son!

Nor was a dramatist responsible for the stage-lover telling the object of his affections: 'In the past, you have shared my adversity; and it is my sincere desire that you may in the future share my posterity.'

Much less germane to the matter was Jefferson's

first stage-speech. He played the infant in *Pizarro*, and when Cora said to Alonzo, 'Sweet child! he will speak soon,' she was not prepared for the instant fulfilment of her prophecy by the 'infant' toddling to the footlights and asking the leader of the orchestra why he did not play his fiddle!—Many years afterwards, the actor was playing his famous part of Rip van Winkle at Chicago, and one night went to the theatre tired out by a long day's fishing. When the curtain rose on the third act, it disclosed the white-haired Rip deep in his twenty years' nap. Five, ten minutes elapsed, but he did not waken. The audience grew impatient, and the prompter uneasy; he supposed the great actor knew what he was about; but this was carrying the realistic business a little too far. At length the gallery waxed uproarious, and yelled their delight at one of their number inquiring, 'if there was going to be nineteen years more of this snooze business.' At this point, Jefferson snored audibly. Opening a small trap beneath the stage, the prompter prodded Rip from below, only to see the sleepy comedian fumble in his pocket for an imaginary railway ticket, and hear him mutter, 'Going clear through, conductor.' This was too much for the prompter; he went at Rip with a big pin; and with a loud shriek, that worthy sat up, wide awake to the situation.

An actor of no great account, except in his own estimation, found his way upon the stage just after the final morning rehearsal of a pantomime, the first scene of which had been set again ready for the evening performance. Heavy with over-imbibing of beer, he tumbled into a friendly bunk, as he supposed, and was soon fast asleep. Night came. The curtain rose upon a tomb, to which, after a little while, the pantomime hero advanced for the purpose of breathing out his life. As he threw himself upon the tomb, it changed into a downy couch, and then he suddenly found himself struggling with a big man. The two rolled towards the footlights, kicking their hardest; but stopping in time, they disentangled themselves, and the half-sobered intruder on the scene, quoting from Shakespeare, at the top of his voice, 'Give me another horse! Bind up me wounds! Have mercy, heavens!' brought down the house as he had never done before, or was likely to do again.

A good story is told of Mr Raymond and the Lotos Club. The comedian persuaded a number of the members of the Club to appear on the stage for one night only as jurors in the trial scene in *A Gilded Age*, conditionally that their names should not be known. Prior to the commencement of the piece, it became known that the newspapers had been furnished with a full list of the amateurs, who, nevertheless, instead of withdrawing from their engagement, determined to punish Raymond in another way. The entire point of the last scene in the play depends upon the jury promptly delivering a verdict of 'Not guilty.' But when

the time came, Foreman Shaw solemnly answered 'Guilty.' There was a pause, dead silence, and then a roar of laughter from the audience. 'O Foreman,' gasped Raymond; 'you don't mean it—you mean just the other way!' 'Guilty!' repeated the Foreman, and the action of the play was completely stopped. Raymond saw it would be of no avail to poll the jury—they were evidently unanimous in sticking to their verdict. 'I move, your Honour,' cried he, 'that the jury be allowed to retire for consultation;' and then, in a whisper, entreated the jokers to 'let up.' The appeal was successful. The Foreman gravely informed the court that the jury desired to change their verdict to one of 'Not guilty;' the supers shouted, the heroine was vindicated, the audience applauded, and the curtain fell.

A practical joke of a different kind was once played by two mischievous scamps attached to the Bowery Theatre. A grand spectacular play was in preparation, in which two hundred supers arrayed as Chinamen were to be discovered on a slope, extending up to the painting-room, situated at the rear end of the building, at a height about level with the top of the proscenium arch. Rum-maging the painting-room, Johnny Williams the property-boy came upon an old wicker elephant; and confiding his discovery to another boy in the establishment, proposed to get some fun out of the supers by rolling the elephant down the slope upon them. Upon the first night of the grand spectacle, the young rascals crept into the painting-room. Presently, up went the curtain, discovering the whole of the stage, the mock-Chinamen covering the slope. Suddenly a monster elephant came sliding, rolling, and tumbling down the incline in a cloud of dust. Supers were crushed under its mighty weight; supers were knocked off their feet, and sent rolling to the stage; supers, scared out of their wits, fled the scene. The panic was over in a few minutes, but was terrible enough while it lasted; and although they hardly deserved such luck, its authors escaped unsuspected, the catastrophe being attributed to the breaking of the ropes by which, for years, the elephant had been suspended.

Perhaps there is no 'property' of which so many stories have been told as the skull passing for poor Yorick's. Here is one which may be new to our readers. When the elder Booth was to play Hamlet somewhere in Virginia, he found no skull had been provided. A little darkey, however, volunteered to get one, and kept his promise. When he was leaving the theatre after the performance, Booth felt some one tugging at his coat-tail. It was the little nigger. 'Please, sah,' said he, 'I want Daddy's skull.'—'Daddy's skull?' repeated the actor.—'Yes, sah. Dat used ter be do ole man's headpiece afore de muke kicked him; an' mammy 'd lick me rarely ef I lose it.'

At the beginning of his theatrical career, Mr W. J. Florence, the popular comedian, played 'general utility' at the Lyceum Theatre, New York, then under the management of Mr John Brougham. Among the new pieces produced by that gentle-

man was one that created no little sensation at its first representation. It was called *A Row at the Lyceum Theatre, or Greenroom Secrets*. Each member of the company appeared on the stage as himself or herself, wearing everyday costume, and the scene was the greenroom of the theatre. The performance was exceedingly realistic, and went off capitally until the entrance of Miss Buggins, a debutante who—as previously arranged—after looking over the part allotted to her, objected to the 'business,' and insisted upon having something more tragic. While she was making matters disagreeable on the stage, a stout, middle-aged man, dressed in Quaker garb, rose in the centre of the stalls, and exclaimed: 'That woman looks for all the world like Clementina! Her voice is very like; the form is the same!' After a pause, he added: 'It is my wife;' and rushed towards the footlights, shouting: 'Come off the stage, you miserable woman!' The audience, at first amused, grew angry, and cries of, 'Put him out!' 'Sit down!' 'Police!' rang through the house. Up in the third tier, visible to all, was a red-shirted fireman, who loudly threatened he would give 'Old Broadbrim' a sound thrashing, if he attempted to lay a hand on the young woman; and was presently seen rushing down-stairs to carry his threat into execution. The house was in an uproar; ladies tried to escape from the theatre, while gentlemen vainly endeavoured to restore order. At last the irate husband clambered over the orchestra, the fireman close behind him, to be seized by a couple of police-officers, and dragged upon the stage. When there, they were made to face the house; and immediately the regulation semicircle was formed, the rhymed 'tag' spoken, and the curtain dropped, almost before the bewildered audience had time to recognise in the indignant husband, Mr Brougham himself; in the recovered wife, Mrs Brougham; in the red-shirted defender of the young woman, Mr W. J. Florence; and to realise the fact that the whole scene had been previously rehearsed, and that they had been very cleverly hoaxed.

Mr H. E. Jarrett, whose 'Cinderella Company' was lately playing in Detroit, relates that he was one evening accosted by a small boy, who showed him fifteen cents, saying: 'Please, Mister, I would so like to see *Cinderella*; but that's all the money I've got.' The manager, unable to withstand the appeal, handed the urchin a quarter of a dollar. The boy's countenance beamed with delight, and moving towards the street, he said: 'You don't know how thankful I feel, sir; I am ever so much obliged to you; and I guess I'll go over to the Coliseum and see *Jack Sheppard*.' Mr Jarrett felt his generosity had been sadly misplaced. He might exchange condolences with our countryman Mr Archibald Forbes, who suffered in much the same way when on his lecturing tour in the States. Asking the darkey cabman who drove him to the hotel at West Chester, Pennsylvania, how much he was to pay him, the cabman replied: 'Well, sah, if you'd jes' gib me a ticket to de lectur', sah, I should be right glad.' Flattered by such a request, Mr Forbes not only gave Jehu a ticket, but added another for his 'missis.' He did not see his coloured friend among his audience that evening; and getting into the same cab next morning to go to the station, said to the driver:

'I didn't see you at the lecture last night?'—'No, sah; I were not dar,' was the unabashed reply. 'You see, sah, I jes' sold dem tickets for a dollar, sah, 'cause I don't know much 'bout lecturs, and tought I'd rader hab de cash, sah.'

The good folks of Macon in Georgia would seem to know as little about plays as the negro cabman knew about lectures, for when Mr McCallough played *Virginius* there, not one of the audience moved upon the curtain falling on the last act; and it was not until the stage-manager explained that *Virginius* being dead, *Virginia* dead, and *Appius Claudius* dead too, nothing remained to be done that evening, that they went grumbling away.

## THE TREASURE AT GRAN QUIVIRA.

### CHAPTER IV.

THE second night passed away as quietly as the first had done; the sun rose over the waterless plains and *mesas* as brilliantly as ever. Despite of the disagreeable tidings of the previous evening, the spirits of the party rose high with the bright morning and its balmy breeze. Gerald and another had ascended the highest *mesa*—no great height, it is true, as the low mound only rose some fifty feet above the surrounding plain—and from its summit had carefully swept the country around with powerful field-glasses, without discerning a living object; no, not even their water-wagon, which ought by this time to have been in sight upon its return journey. There was as yet no pressing want of water; but anything like a delay in this supply would be awkward, and if sustained, would be fatal to the enterprise.

Annie and her lady-friend made themselves very useful by preparing the meals in a more inviting manner than had hitherto been done; yet the Señorita found time to ascend more than once the *mesa*, on which the look-out was now constantly kept. Although Gerald was as hard at work as any one of the party, he asked Annie and her friend to take an hour's ride over the plains, in which he would accompany them; but the girl shudderingly refused, turning quite pale at the proposal; an unusual thing with her. 'No, Mr Elkley,' she said; 'I must not. You must not ride out to-day. No one should leave the camp singly; no one should leave it at all except with a fighting party.'

'But Annie!—Miss Tate'—Gerald corrected himself; but the slip brought a little colour back to the girl's face—'all is safe, all is quiet; no living thing is in sight.'

'In sight! I do not fear any living thing if it is in sight!' exclaimed the girl. 'But I am morally certain that near to us—perhaps within rifle-shot—there are those who would be only too ready to thin your numbers, did you venture near the ambush. I do not speak in fear of myself; yet I know that in revenge for what my presence here has told them, I should be their first victim. Be on your guard, Mr Elkley, against

treachery within, as well as against foes without. José has warned you.'

Yes; José had intimated suspicion, but it was suspicion only; and while Elkley resolved to use the utmost vigilance, he yet saw no reason for the alarm under which the whole of the party from Blue Creek evidently laboured. But no argument could induce any of them to leave the camp; and the day wore on unmarked by any feature of interest, beyond the sustained digging and probing, save that the water-wagon did not arrive. There was only enough water for another day's consumption; therefore it was decided that if the wagon were not in sight at sunrise, a party should at once set out for the springs, to procure a supply, as well as to learn what had become of the men.

Somewhat more of depression was visible in the camp this evening than before; and none of the party cared to take the stroll which would have been so refreshing, so pleasantly conducive to chatting, so enjoyable for smoking, after the labours of the day; but lounged about moodily, or gazed wistfully from the *mesa* top in the direction of the expected wagon. Darkness closed in; the sentinels were duly placed, and all was silence and gloom on the vast plain. Again the night passed without disturbance; and when the sun rose, every man arose also, and climbed the *mesa* to look for the expected water-supply. No wagon was in sight.

This was unaccountable, and, in addition, very serious; indeed, they could not hold out beyond that day without a supply. A council was called, at which, while some urged the carrying out the proposal of overnight, to set out at once, others argued that if any accident had detained the men, involving the repair of the wagon, they would be likely to start at sunrise also, and therefore it would be better to wait yet a few hours; and this view was adopted. It was finally decided that they should wait until noon; and then, if no trace of the wagon could be discovered, an expedition should start, which would reach the springs that night, and return in the morning. Even this involved the diminution of the usual allowance to one half. As there was reason to fear that the first wagon had been attacked, it was determined that a stronger party should now go out; so six men were picked for the duty—two of the prospectors, two 'white' helps, and two Mexicans. It was hoped that so strong a party, especially with no valuables in charge, would not be molested.

The digging proceeded with less spirit on this day, partly from the mysterious failure of the water, and partly because the greater part of the supposed chapel area had been tested without result. It was true that they could easily have been mistaken in their selection of the spot; but if so, it became disheartening to look round and see where they *might* have to dig. Just after noon, when Elkley was about to give orders for the mules to be put in the wagon, a welcome shout from the *mesa* top announced a wagon in sight, and every one felt that a weight was taken from his mind. All rushed to the summit, and saw, beyond all doubt, crawling slowly, just within the horizon, and barely visible, a wagon and team. The meal just prepared was discussed with greater appetite, while laughter and jesting

displaced the uneasiness which had been previously but too palpable.

The only exceptions to this uplifting of the spirits were in the party from Blue Creek. Annie seemed to grow more timid—*anxious* would probably be a better word to use in her case—and whenever at leisure, she repaired to the summit of the *mesa*, and gazed wistfully in the direction by which she had come. Mrs. Sammy appeared to share this anxiety; while Jonathan, her husband, flatly refused to work, or to lay aside his rifle for a moment, and no sentinel could have patrolled the camp more regularly than did that worthy. It was in vain to remonstrate with him. 'If you calculate on getting out of this without using your shooters, you're off on the wrong foot, you bet,' was his reply to all argument; 'and no man ain't going to git the first draw on this here child, if he can any way git the first draw on *him*.'

Work had been resumed, when the look-out called to Gerald, who at once went up to him.

'Say!' began the man; 'that wagon gets no nearer, and it's crossing the plain to the north. I don't think it's our team, anyhow.'

Elkley watched for a time through the glass, and saw that the scout was right. The vehicle had travelled several miles without coming closer. For a while, it had seemed possible the driver might have been choosing the best track; but it had now passed beyond the line of the camp, and was evidently merely a chance team going northwards. A most unfortunate delay had arisen in consequence of this mistake, as the afternoon was now pretty well advanced. As soon as the intelligence spread, the whole of the prospectors assembled on the *mesa*, and a general feeling was expressed that the water expedition should set out at once. They were discussing who and how many should now be chosen to go, when José ran quickly up the *mesa* slope, and then, with an abruptness quite unusual with him, he thrust himself into the centre of the group. He wore a hard scowl on his determined features; but his voice was harsher as he said: 'My dog Dodon is murdered! Some traitor has stabbed him outside the camp. I'll shoot him if I find him. But what are *you* going to do about it, Señores?'

This news startled them all. It was instantly plain that whoever had killed their savage but invaluable four-footed guard, meant no good to the party; and for a moment even the want of water was forgotten in this alarming incident.

Many hurried opinions were given, most earnest among which was José's strenuous advice to lynch 'that Mexican,' to whom he gave credit for the death of his dog; when, during a moment's pause, the nasal tones of Mr. Sammy were heard. 'I expect you air right about that Greaser, José,' he said. [Greaser is the regular name for a Mexican in the vulgate of New Mexico, and used without any intention to offend.] 'But if we lynch him, he can't tell us nothing afterwards; and what's more, we can't make use of him to spile the hands of them cussed white Injuns which are sneaking around, I bet my bottom dollar. I can see jest what the game is, and I can spile it, I can. Here's the idea, if you will listen.' The crafty old frontiersman then expounded his views; which were adopted immediately, as all were pleased to find anything like a definite plan offered in the crisis which seemed to be impending.

The work was carried on for the remainder of that day in unusual silence, announcement being first made that the wagon would start for the springs directly after dark, and that the force would be divided; eight would go with the team, while nine would keep the camp. The wagon would reach the springs in four or five hours, it was calculated; and so could return by noon the next day, giving the mules some rest. Annie was much distressed at hearing that the camp was to be left with so weak a garrison; but was too good a soldier to murmur. She was observed to be cleaning her light rifle, which had not previously been shown; while Mr. Sammy's spouse openly, and without any compromise in the matter, buckled a revolver to her waist, in most approved Western fashion.

Supper passed almost in silence, which prevailed also during the short interval of twilight; then, as darkness gathered round them, the mules were quietly brought out, harnessed to the wagon, and the selected eight—four prospectors, two 'white' helps, and two Mexicans—started on their errand. The suspected Mexican was retained in the camp; so was José.

'Señor Elkley,' said the latter, as Gerald stood listening to the now faint sound of the departing team, 'that thar Greaser has been out of camp. I see him come sneaking round back of *mesa* just now. I think we better hang him at once.'

José's advice was not adopted; and a silence as profound as that of the wide prairies themselves settled down upon the camp.

It was a dark night; the moon was in its first quarter; and although in those cloudless skies the stars were shining, their light was only just sufficient to make all surrounding objects more confused and misleading than they would have been in absolute darkness. It was easy for any one on the watch—and all in the camp were painfully on the watch that night—to conjure up a succession of fresh shapes in the darkness, which moved and came and went; while in the oppressive silence it was equally easy to imagine a succession of mysterious sounds. In homely phrase, we may say that a night-watch on the prairie is calculated to make the boldest nervous. The hours wore on. José, armed to the teeth, had thrust himself into the company of the suspected Mexican, and wherever the latter went, José went also. No word of threat or suspicion was uttered; but the Mexicans are a jealous and suspicious race, and the man knew as well that José had fastened himself upon him for a purpose, as though the latter had openly proclaimed it.

The night crept on; the hour at which those not on guard had usually repaired to their tent beds, was past, but not a soul had thought of sleep; every light was extinguished in the camp; even the indispensable pipes were screened, lest their glow should betray their owners, and midnight was near, when a faint sound, which might have been the cry of a distant night-bird, was heard. Every man in the camp grasped his rifle, whilst José hissed in a fierce whisper to his unlucky countryman, with great English additions: 'You move a finger—only wink!—and I put a knife in your ribs.'

The cry was again repeated; and then a dozen flashes broke out of the darkness of the night, and what might have been a murderous volley was

fired, at close quarters, into the tents, while a hideous chorus of yells and shouts told that the long-dreaded assault had now begun in earnest.

A single flash from old Sanny's pistol, as he lay on the summit of the *mesa*, was for a moment the only reply; but then a bright blaze shot up, apparently from the earth, which instantly became a tall column of flame, brilliant and unwavering in the still air, and proceeding from a pyramid of rags, straw, wood, splinters, and all kinds of rubbish, collected by Sanny, and soaked in paraffin or kerosene oil. The shouts of the besiegers were returned by those in the camp; and as all disguise was now at an end, volley after volley was fired into the deep shadow of the *mesa*, while the pillar of light showed the assailants as they moved to and fro. Suddenly a harsh voice—it was recognised—was heard to shout: 'Now, boys, for the rush!'

A score of figures leapt from the earth at this, and came with headlong speed for the camp.

'Be ready!—meet them coolly,' shouted Elkley in return. He was hidden by the gloom; but a bullet struck him as he spoke, and he fell. The assailants were close to the camp, when, as they gave one final yell, preparatory to the hand-to-hand fight which seemed inevitable, some swift jets of fire flashed from an *arroyo* in their rear, the sharp crack of rifle-shots was heard, and at least half-a-dozen of their number were seen, by the light on the hill, to stumble and fall. A volley was then fired from the camp; while the shouts in front and rear told that the stormers themselves were to be attacked in both quarters.

They paused in their rush; several of them dropped on the prairie to seek cover. Their leader shouted in vain. 'Boys!' he screamed, 'the camp is your own! It is full of dollars! Darn ye! Don't give up.'

Ere he could utter another word, he and those with him were in the centre of a wild fight, where the flash of firearms, sweeping blows with rifle-butts, and the gleam of knives, all had their part. The assailants were beaten back; several of them had hurried away—leaving their comrades to their fate—when the first deadly volley was poured upon them from the rear. The leader himself was wounded, and had retreated for a moment behind a mound. 'Come, captain! it is of no use fighting any longer,' said one of those who had kept resolutely by his side; 'we're whipped!'

The leader turned as to fly; but as he did so, the now sinking light on the *mesa* showed the dresses of women, who were apparently standing in a wagon, watching the contest. 'If it's my last shot, she dies, for a traitress!' exclaimed the leader, throwing his rifle to his shoulder. As he spoke, a man who had been engaged with the last of the assailants who showed fight, sprang towards him and knocked the barrel on one side. 'Sy Tate, you're wrong! The bullet ain't cast that can hurt Señorita Annie. Give in, or you're a dead man.'

José—for it was the Mexican—had closed with Sy while speaking; but the old desperado managed to draw his pistol, and its flash, followed by an execration from José, told the latter was hit, just as he threw his arms around Tate, and they fell heavily together. The report of the pistol, with the noise of their struggle, drew

several of the camp party to the spot, for all was now quiet elsewhere. The band of stormers was disabled, or had fled.

'José!' cried the voice of Mr Sanny, 'let me get a shot at him, José! Are you on top or under?'

There was a momentary still fiercer dashing and writhing with the two men, neither of whom could be distinguished by those who stood around, then a terrific shriek followed, and then José rose on one knee, panting from the struggle, and sheathed his knife. 'I reckon he's dead,' said José quietly. 'Old Juanna was right. Now we will go and lynch that Mexican.'

'You can't,' said Mr Sanny; 'I reckon I've quieted him. I couldn't help it, pardner, I meant to leave him to you; but I see him shoot Señor Elkley in the back, and my feelings was too much for me.'

'Captain Elkley killed!' exclaimed those who heard this announcement; and a rush instantly took place to the camp, where, under the guidance of Mr Sanny, they found Gerald stretched upon his face, with the blood still oozing from a gunshot wound in the neck.

'He ain't dead!' said José, who had at once dropped on his knees by the side of the insensible man. 'Go and fetch Señorita Annie, and tell her to bring the bandages and fixings. I want some for my own thigh; that old Sy Tate nearly made me pass in my checks.' This was José's mode of explaining how nearly he had been killed; and it was accepted as being quite grave and serious enough for the occasion.

In a few minutes Annie, with Mrs Sanny, arrived; and the largest tent being converted into a hospital, the wounded men were brought in. These were numerous, as were also the slain. Besides Gerald, two of the prospectors were wounded, and another killed; one hired help and one Mexican killed, one hired help and José wounded. The attacking party had suffered far more, so that the boasted surgical skill of José was of great service, as were also the calmness and presence of mind of Annie and her companion. Gerald's wound was pronounced to be serious, yet not fatal; but he was insensible all night. When the morning dawned, one man was sent off with a team, for the springs; while another rode many miles to the next telegraph station to send for surgeons and to apprise the authorities of what had occurred.

The alarm spread in other ways; and many men rode into the camp from the springs and from lonely ranches, all ready to fight, if need were, and all heartily rejoiced to find that the killed and wounded of the desperadoes comprised some of the most notorious and dreaded ruffians of all who infested the frontier. Those among the latter who could speak were especially anxious to learn who were the men that attacked them in the rear; they knew from the Mexican who was shot by 'old man Sanny,' as he was always described, that the camp was to be left with only nine defenders including himself, and he had slaughtered poor Bodon, and had promised to do as much for at least one of his comrades; which diabolical pledge he had redeemed directly José had left him, to join in the fight.

Great was the astonishment of these men to learn that their designs had been forestalled, and

successfully discounted; that the water expedition had been but a feint, pulling up and tethering the horses under cover of the darkness, while the whole of the party crept silently back, and concealed themselves in an *arroyo* near the camp. Mr Sanny's judgment and advice had not been at fault—we shall speak of him respectfully, although his associates did not—and the determined repulse of the night attack had broken up the most threatening combination of outlaws in New Mexico.

The poor fellows who had first been sent for water were found dead a few miles from the springs, having been waylaid on their return journey; so taking all the incidents together, the zeal of the party in treasure-hunting was considerably abated. Some of those who came to their assistance seemed disposed to carry on the search; but a day or two satisfied them. Thus, by the time the wounded could be removed, there was a general feeling of disgust at the project.

Gerald, with others, was carried to Santa Fé, where he lay for a long time before he recovered strength; and Annie Tate, assisted of course by Mrs Sanny, was his nurse throughout. During his convalescence, he held many conversations with her relative to the death of Sy Tate; and as a natural consequence, they spoke of her plans for the future. On these, Annie was very reluctant to dwell, alluding vaguely to some scheme she had in view; and it was not until Gerald had also consulted Mrs Sanny and José that he found Annie intended to offer herself as governess and 'general help' on some remote ranch where there were children to be taken care of. Old Sy Tate was popularly supposed to be rich, and no doubt this belief was correct; but Annie knew nothing of the disposal of his riches. He owned the house at Blue Creek and some of the best land around; but beyond this she knew nothing.

These conversations awakened some very natural reflections in Gerald's mind. He was fairly wealthy; had seen enough, perhaps a little too much now, of adventure. Annie had grown indispensable to him; he owed his life twice—perhaps thrice—to her; in short, he found it impossible to reconcile the idea of parting with her. He thought he should be far happier with a wife, than without one. The reader is no doubt of the same opinion. Like a true Yankee, he had no absurd qualms about marrying out of his set, or for studying others in a matter which concerned only himself. He knew that Annie's brilliant beauty would shine in a Boston assembly brighter than in New Mexico; that she was so quick and intelligent, that no one would detect a trace of her Amazonian, frontier character; and, in short, when he grew well, he asked Annie to become his wife. To his surprise, she shed tears that were almost hysterical, and tried to say 'No'; but she could not, and as the only possible alternative, said 'Yes.'

The only business arrangement which they transacted before leaving the territory, was the assigning to Mr Sanny the house, ranch, furniture, stock, and, above all, the weapons formerly the property of Sy Tate; all of which, especially the last, had been the envy of 'old man Sanny' for many and many a day.

Gerald and Annie still live in one of the New

England States; and their children are always accompanied by a swarthy Mexican, who spoils them far more than do even their father and mother; he limps slightly, and is called José.

## EXAGGERATIONS.

Nothing is more characteristic of the present age than the tendency to exaggeration of language which prevails among all classes. The equivalents for the adverb 'very,' in the form of 'awfully,' 'fearfully,' 'tremendously,' &c., have become so common in the course of ordinary conversation that they are scarcely looked upon as slang now, and are uttered freely, even by the educated of both sexes, without a moment's appreciation of their true depth of meaning. Sometimes this peculiar phase of expression takes another form, converse as to its application, but precisely the same in effect—that is, a ridiculous diminution or understatement of magnitude. Thus, we hear 'a few,' 'rather,' 'slightly,' 'somewhat,' &c., used to denote an amount for which the strongest terms would be appropriate. Many of these sayings are of transatlantic origin, the dry humour of our cousins abounding in like phrases. Although such extravagances of expression and idea are deliberately and palpably untrue, they are so obviously employed without any intention to deceive, that they may be considered blameless of the vicious aspects of a commonplace falsehood. For instance, when Artemus Ward tells us that on his recovery from fever he was so thin that, standing edgewise, he could not be seen at all, and that you might have cleaned the stem of a tobacco-pipe with either of his legs, he certainly does not mean us to believe that his emaciation had actually reached that painful extent. So, too, Dickens, in his preface to *Barnaby Rudge*, describing one of the two living originals from which the raven Grip was drawn, can scarcely intend that we should accept literally the statement that the bird ate a staircase, consisting of six wooden steps and a landing, before succumbing to a pound of white-lead taken internally.

'You might have heard a pin drop,' is a tolerably strong expression in itself, frequently used in speaking of a sudden silence among a multitude of people; but the assertion that in a crowded hall at a critical moment the stillness was so perfect that 'the accidental dropping of a pin reverberated like thunder,' goes further. And the nigger must have been black indeed, upon whose skin charcoal made a white mark.

An American had been bragging for some time in a public bar-room of various marvellous feats of swimming which he had witnessed or performed; when an Englishman, who had listened in silent incredulity, bethought himself that he would defeat, or try to defeat, the boastful 'Colonel' with his own weapons. The old country, he considered, was able to beat the new at anything—even at fibs—if her sons tried; so he suddenly spoke up.

'Well, yes, Colonel,' struck in the Britisher, 'those were big swims, I admit, that you say you've seen; but I've known one that beats all yours hollow. Two years ago, I started from Liverpool for New York in one of the Cunard boats. There was a little commotion and excitement on the wharf at leaving, and a man dived

into the water; but we took no particular heed of it. Next morning, we remembered it, though, for, sure enough there was a man swimming abreast of us at the rate of fifteen knots an hour. We called out to him, and heaved him a rope, but he refused all assistance. At night of course, we lost sight of him; but when the sun rose, there he was again, striking out as lively as possible. And so he stood by us all the way across, sometimes diving under our keel, and coming up on the other side; sometimes playing round us like a dolphin, now on his back and now on his side; now turning head over heels, wheel-fashion. But about two hours before we reached New York, he began to forge ahead, and soon distanced us altogether; and when we got alongside, we found him standing on the quay, dressed to receive us.

The Yankee had eyed the speaker fixedly during his narration. 'That's a true yarn, I s'pose, stranger?' he said interrogatively.

'O yes, quite true; I saw it myself,' was the reply.

'You saw that man swim across from Liverpool to New York alongside yer steamer all the way?'

'Exactly.'

'Stranger, did yer know that man?'

'Well, no!' answered the Englishman cautiously; 'I didn't know him; but I saw him, nevertheless.'

'Stranger, I was that man!'

At the whist-table, one often hears exaggerated forms of expression, especially from the lips of experienced players, in sarcastic remonstrance with novices; witness the old aphorisms about the number of little children now running about shoeless and in rags, because their fathers neglected to lead from five of a suit, and the only two excuses for not returning trumps—when you haven't got one, and sudden death—and the like. 'What can one do against *three* such adversaries!' was the vicious exclamation, when the trick was lost, of an old devotee of the game, whose partner was certainly not all that Cavendish could have desired.

'Why did you not lead spades?' I once said, somewhat captiously, to a whist-player whose hand I had been overlooking, and who had played cautiously, when, as it seemed to me, after the event—the period at which it is so easy to give excellent advice—leading differently he might possibly have scored more tricks. 'That's what I should have done.'

'Ah,' he replied, looking back over his shoulder at me through his spectacles calmly; 'you have the world before you, and none but yourself to consider. You have no wife and family dependent on you for bread, as I have. Had such been your case too, you would certainly have led spades.'

I should mention—to prevent misconception—that the stakes were sixpenny points. The same gentleman, when the conversation at the dinner-table touched on wife-beating, expressed his conviction that the man who could lead from a single card was equally capable of striking a woman.

Here is a fact which is not a 'stretcher,' though it might reasonably be taken for one. There is a railway in the Argentine Republic which has a great many small stations in the suburbs of Buenos Ayres. On this favoured line, the speed of the locomotives is so remarkable, that when people

miss a train at one station, they not unfrequently drive on to the next, and catch it there!

Sailors have a great many queer sayings which certainly overstep the bounds of exact truth; such, for example, as the assertion that a ship is going so fast as to make her keel red-hot. I once sailed with a captain who constantly made use of the quaintest, and at the same time most harmlessly untruthful mis-statements of this character. He had bought, at the last moment before sailing, two packets of writing-paper, which turned out to be of very inferior quality.

'Coarse? I believe you. Why, my pen kept fetching up against lumps of stuff like oatmeal in it. I gave it up at last, and tried the other packet; but that was worse. If the first had oatmeal in it, this was full of Indian corn!'

Talking of the danger of cutting bread with the edge of the knife inclined towards one's hand, he declared he had twelve married sisters in England, all with large families, and much in the habit of cutting bread and butter; every one of them was a finger or two short, in consequence of this baneful practice.

One night at sea, meeting a large American steamer which displayed, in addition to her usual red and green side-lights and white mast-head light, several other coloured lamps as a night-signal, he exclaimed: 'Why, here's a druggist's shop coming!' And once, when he was fired on in Aspinwall by a drunken rowdy in mistake for somebody else, and had rushed into a store and hidden himself under the counter until matters were explained, he afterwards excused his apparent want of courage by the remark, that it was better to look a coward for five minutes, than to look a corpse for evermore!

We had a number of cats on board, of which he was very fond. A passenger who by no means shared this predilection for the feline race, made no secret of his views on the subject when the skipper's pets came purring around like little harmoniums at breakfast-time. 'I suppose, Captain,' said he, with infinite sarcasm in his tone, 'if provisions ran short, you would feed your crew on cats?'

'Not while there were any passengers left,' was the unexpected though well-deserved reply.

Spaniards are anything but renowned for the sanitary condition of their dwellings, a fact of which a traveller soon becomes aware as he walks through the streets of a Spanish city. Yet they become most fastidious on board ship, if they get an occasional whiff from the bilges or the catterpans forward; and it used to annoy our Captain exceedingly when they complained. 'Bilgewater!' he used to exclaim, more forcibly than politely; 'they'd be glad of it on their handkerchiefs at home!'

He had a story, too, which he told with the drollest exaggeration of detail, about an occasion when he was out shooting, and sitting down on a bank to rest, found that he had perched himself on a hornet's nest. The bank was tunnelled by them; and as luck would have it, he had seated himself upon, and thus closed the only exit available for the imprisoned insects. He dared not get up, lest they should swarm out in a body and sting him to death. There were millions of them, he said; for the earth for yards around hummed and vibrated with their subterranean raging, like

a high-pressure steamboat under way; but there was no other orifice. At night, several others came home to go to bed, to whom he had to 'explain.' I forget how long he sat there—a week, I think—much longer, at any rate, than one would sit on a bank under ordinary circumstances; but he could not raise the siege until the imprisoned hornets were all starved.

He would not have been flattered by an observation which I once overheard, and with which I had better conclude: 'When one seafaring man corroborates the statement of another, he stamps it unmistakably as a "stretcher."'

## MY TROUBLES IN RUSSIA.

### TROUBLE THE SIXTH.

I AM up with—I had almost said the lark; but in the cause of truth, I must even descend to the level of the cocks and hens; for it is none other than a bevy of these unpoetical birds which have crowed and cackled me out of bed this morning. My bedroom window looks into a back court, where the stables are, and I behold a carriage. 'At last!' I say aloud, as I rush like a whirlwind through my toilet. As I am tying on my hat—for I must make quite ready to start—Mina knocks at my door.

'Come in,' I sing, too much elated to modify my voice into sobriety.

'Ah, *Prinzi* is clever; she is up and dressed!'

'Yes,' I say, cutting her short; 'and the carriage has come to take me away, Mina!'

'*Eh, o, Prinzi*! No, no, Miss; that is the great gentry's carriage who are at breakfast in the waiting-room,' she explains.

'Not the carriage from Waimel?' I exclaim, sinking wofully into a chair.

'It is early still. *Prinzi* must not expect too soon. It is only five o'clock, and the journey from Waimel is six hours; she must not expect before ten.'

There is reason in what Mina says; so I slowly untie my hat, and sigh as I mentally count the hours from five to ten. Five long hours, I think, before I need begin even to expect.

'I will serve *Prinzi's* breakfast in the waiting-room,' Mina says at the door; 'the kitchen is full of men.'

'I will wait until those people are gone,' I reply, as I take my stand at the window and watch them change the horses. The lumbering family chariot clatters out of the court, looking for all the world like an ill-favoured grasshopper on its high springs; and I listen until I hear the bell—without which the Russian coachman is loath to travel—ringing into the distance.

I take my solitary meal, solemnly and slowly; I stare vacantly out of the window; I go out and sit on my box in the veranda—but still no carriage.

A bell in the distance! I am in the middle of the road, shading my eyes with my hand. It is only a droschke, filled with students on their way to Dorpat. They are, as usual, noisy and idiotic; so I deem it best to retire to my bedroom until they are gone; but I leave the door ajar to listen. Of course they order beer. They must be Russians and Germans, for they are mixing up the two languages.

'Mees M. Estwood!' I hear drawled out. They are reading the address on my handbag. 'An English Mees.—I know her, Fritz; she has red hair and green spectacles.'

'And they call her Meary!' cackles another.

'No; hold your tongues! I remember the lady perfectly; she is an ancient friend of my family, and I love her! True, she has only one eye; but she lost the other in a noble cause. It was scratched out whilst its owner was defending my honour against calumny.' This witticism is received with a roar.

'Idiots! Idiots!' I hiss between closed teeth, and shut my door with a bang. I hear another roar of laughter, in which I faintly join, for the eye business amuses me. They too rattle away, leaving cigar-ash and beer-dregs behind them; and I return to my box-lid and my anxious watch.

It is twelve o'clock at noon, and still no carriage! I can no longer sit still, but pace the veranda from side to side as I have seen a hyena do its cage. What am I to do? My letter must have miscarried.

At this moment, the station-master—oh, wonder to relate!—condescends to seek me. 'I fear there must be some mistake, Madam, about the carriage from Waimel,' he says. 'Of course you wrote!'

'Of course I did. And told my friends that I would leave Dorpat by diligence yesterday morning.'

'Ah well, then, the letter must have miscarried, and it is no use waiting.'

'But what shall I do?' I cry. 'I had better write again.'

'That would oblige you to send a messenger, and you would have to stay here another night. No; you had better travel post,' he suggests.

Post! Why have I never thought of this? Of course I will take a postchaise. I must be demented not to have thought of it before. The station-master retires to give the orders and get his bill; and in a few minutes I have turned my back—oh, how thankfully!—on that most dreary of stations.

My readers, are you acquainted with that instrument of torture, a Russian postchaise? If you do not, avoid it as you would a pestilence, if you value your bones. It is a short, wooden cart, higher at the back than the front; it jolts, and, where the roads are rough, jumps along on two high wheels. Your seat is a wisp of straw at the bottom, and your luggage forms a rasping support for your back behind. You can only sit with your legs stretched straight out before you, which position after the first hour is the rack. I have been in it an hour and more, and am holding my head with both hands, to prevent my brains jumbling together; for we are tearing up a hill—we always tear up hills in Russia—in that most lovely part of Livonia called the 'Livonian Switzerland.' My driver has a wild, unkempt look—ferocious, I think—as he shouts to his horses with upraised hand; but I am too much occupied with the care of my brains to trouble much about his appearance at present. Thank Providence, we are at the top of the hill, and at walking pace, the horses steaming with the exertion, and I can look about me, even with the cramp in my limbs, and admire the scenery. It is impressively wild and solitary. To my right, a steep hill rises, clad in dark-green firs, interspersed

with the graceful, feathery birch; to my left, a deep ravine, from which we are divided by a low wall. I can hear the water tumbling at its foot, though I cannot see it for trees. There is not so much as a peasant's hut to remind me of human existence. We are alone with Nature.

As I gaze—oh, woe is me!—my thoughts, I know not why, revert to an awful tale. I had heard of a murder which occurred last winter on the Neva. A gentleman had left St Petersburg for Cronstadt in a droschke, and was never afterwards seen or heard of. It was presumed that the unfortunate man had been murdered by the driver, his pockets plundered, and his body thrust into one of the many holes in the ice. These things were of frequent occurrence. For several minutes, I see no more of the scenery. I am alone with this man. It could all be done in a few moments. No one would be any the wiser. He could murder me, throw my body over the wall, and take possession of my belongings. People would wonder for a time what had become of the English girl. My friends at Dorpat and Waimel would perhaps exchange letters on the subject, and lose themselves in surmises; but they would never suspect my fate. And my own people would wonder, blame, and fret; would think perhaps that I had forgotten them, whilst my bones rotted in a Russian ravine. I look up at my driver. He is a powerful man, broad-shouldered, with long tawny hair flowing in the wind. At this moment, in my present state of mind, even a back-view suggests any number of murders! But it has evidently not occurred to him yet what a chance is here; for he sits quietly on his box with slackened reins and listless mien. By degrees, however, as I am still alive and nothing is being done, I grow more calm; one cannot be always in a panic; and I am inclined to laugh now at my foolish alarm. We have torn up more hills and walked along more levels, and I have almost dismissed the disagreeable subject from my mind, when the chaise suddenly stops.

The blood rushes to my heart. The driver is slowly descending. 'Farewell, earth! Farewell, mother! You will never know the fate of your poor child.' He has thrown the reins on to the horses' backs, and turns and looks me full in the face. I do not know how I look or what I do; but he looks away again, and begins slowly to unbutton his coat. He is feeling in his pockets. Seeking the wherewith to murder me! I think. Not yet. It is a flask of *vodki*. He will make himself mad drunk, and then!—He takes a long pull. My heart beats so violently, that I seem to feel the chaise give a jerk at every throb. He returns the flask to his pocket, and fumbles again. I watch as one might watch an adversary who holds the muzzle of a pistol to one's forehead. He brings out something—I cannot see distinctly from the over-straining of my eyes. It is—gracious powers!—a clasp-knife, and he clicks out a cruel glittering blade. I cover my eyes, and try to say my prayers. I am distractedly entreating for 'my daily bread,' poor wretched, half-crazed soul; and I am still not murdered, and there is perfect silence. So I take a peep at him through my fingers. He is searching his pockets again. This time, for a whetstone, to make the work more sure! I think. But I still watch with a grim, despairing curiosity. He produces a strange-look-

ing brown mass. What is it? I widen the breach between my fingers, and bring another eye to bear upon it. I cannot make it out. He is again groping in a pocket; and at length brings up a short stick, and I recognise it in a moment, and feel more steady—the gay china bowl of a pipe! He adjusts it to the stem, and—hurrah! begins solemnly to shove down the brown mass into it with his pocket-knife. It is 'Karria Yaak!' And he is not going to murder me.

He fills his pipe, good, honest fellow; lights it leisurely with a flint and steel, and leaning his mighty shoulder against a tree, surveys the country, as he dreamily draws in the smoke of his beloved weed. How could I have supposed that placid, sheepish face to belong to a murderer? I positively blush for very shame at myself for my cowardly fancies.

But now that this violent revulsion of feeling has come, an almost deadly languor overtakes me. I believe if he wanted to murder me now, I should scarcely struggle; my arms are like weights of lead. The chaise may jump over stones and do its worst. When we are again in motion, I fall into a heavy doze, and only regain consciousness when we are rattling over the round paving-stones of the little town of Verro. In a few minutes we are driving into the quiet grass-grown court of Waimel; and I am tumbling out of the straw at the bottom of the chaise, a jaded, dusty, creased, dishevelled, hysterical bundle, into the arms of my friend.

'Why have you come upon us this way? Why did you not write, as was arranged, and we would have sent the carriage to meet you?' are the breathless questions which greet me.

'I did write!' I cry; 'and I have been waiting at the office since yesterday afternoon.'

'And we have never got your letter!'

An hour later, when we are seated, a merry party, round the tea-table, and I am relating the story of my adventures, a servant brings in the postbag. The contents are turned out. There are business letters for the Baron, the Dorpat and Riga Gazettes, and last of all, my retarded letter, which has cost me so much suffering.

My story is done, though I have not told you one half of the troubles I have gone through. But before I take leave, I would give my readers a word of advice. If they love order, and would keep their heads cool and free from revolutionary principles, let them not make a lengthened stay in Russia!

## THE MONTH.

### SCIENCE AND ARTS.

AN ancient aqueduct, built by the Emperor Augustus to supply Bologna with water, has, after a lapse of eighteen hundred years, been restored to its original use. A great part of the masonry had been altogether destroyed; but that which had withstood the action of floods and other accidents was as hard as granite. The structure consisted of brick and stone cemented together with a mortar composed of volcanic sand and lime.

Some months ago, we heard a great deal about the increase of myopia or short-sightedness in our public schools. Professor Cohn has been led to

investigate the causes of the increase of the same disease in the German schools. He finds that in village schools the malady is almost unknown; but as the towns are approached, where it may be, he supposes, greater calls are made upon the pupils, the number of cases gradually increases. More than this, the number increases from the lowest to the highest class in all these institutions, the short-sighted pupils becoming more so as they attain the higher honours.

Professor Cohn attributes this lamentable state of things not to over-study so much as to badly constructed schools, furniture ill adapted for school-work, bad writing, and bad type. This last item he considers of special importance, and urges that a reform should be commenced without delay. He suggests that inspectors of schools should gauge the type of the books in use at each particular school, and that those printed in type below a standard size, should without hesitation be rejected.

According to an American paper, a fire lately occurred at the Etna Rubber Mills, Jamaica Plains, the cause of which was traced to a most unusual source. The solvent which is commonly used as a medium for the cement which fastens pieces of india-rubber cloth together, is naphtha, a highly inflammable liquid. It appears that in lifting a sheet of this cloth from a pile of the same material ready cut out for garments, enough electricity was evolved to cause a spark to pass between the sheet raised and the bulk of the cloth below. This spark set fire to the naphtha-cemented joints, or to the inflammable gas rising from them, and the whole room was soon in a blaze. Luckily, the fire was extinguished without any serious loss.

The fourth of July celebrations, which are generally accompanied by fireworks, guns, and any implement which will make a noise, have been followed this year, in many of the American towns and cities, by quite an epidemic of lockjaw, which in many cases has proved fatal. This is due to a toy pistol, which, on account of its cheapness and general efficiency, has become very popular among the boys. It possesses an iron barrel, and is loaded with a blank cartridge; but the trigger arrangements are not such as to recommend themselves to the advanced sportsman, inasmuch that, in the process of loading, the little weapon is apt to discharge itself without notice, severely injuring the hand of the operator. In the cases quoted, of which there were fifty in New York alone, the greater injury was generally caused by laceration, owing to small pieces of metal being blown into the flesh. The sale of those murderous weapons has been stopped; and it is hoped that the vendors will not try to find a market for them on this side of the Atlantic.

At the Bee Exhibition recently held at South Kensington, several novelties were shown, which were full of interest to all bee-keepers. Among these we select for notice a pair of gloves, or

rather a double pair, which are said to render the hands perfectly secure against stings. The inner pair are knitted, and the outer pair made of cotton, the combination forming a fabric which cannot be pierced by the most pertinacious of bees.

Some analogies between the sense of hearing and that of vision have recently been suggested by experiments instituted by Herr Urbantschitsch. He placed tubes in the ears of the person experimented upon, and then brought near one ear a loudly sounding tuning-fork. This fork was then touched so as to considerably diminish, but not to stop its vibration. Its sound could not now be detected by the same ear—which seemed to be fatigued by its previous experience—but was plainly audible by the other ear. This fatigue seems to last from two to five seconds, and only affects the ear if the sound repeated is of the same pitch. If a different note be sounded, it is heard equally well by both ears.

Such experiments as these are highly interesting and useful, as turning attention to a branch of science about which little is known. Diseases connected with the sense of hearing are unfortunately very common indeed, and doctors agree that the cases generally are of a very unsatisfactory nature, which means in plain words that they are not easy to cure. By careful experiment, it may be possible to throw some light upon many points which are at present obscure.

Many investigators have at different times endeavoured to test the action of extreme cold upon vegetation; but the seeds experimented upon have usually been those furnished with a thick skin. The effect of a temperature of *minus* one hundred and ten degrees upon seeds of a larger and softer kind, such as the Indian chestnut, has lately been determined by Herr Wartmann. The chestnuts were each protected by a covering of tinfoil, so that they might not be injured by the chemicals employed to reduce the temperature to the degree named. After being subjected to this intense cold for two hours, the chestnuts were planted—with the result that they germinated in the normal manner. It would be thus seen that this resistance to cold is not a peculiar property possessed by certain seeds, but is common to all. In the meantime, another scientist, Herr Howath, has been experimenting on the effects of extreme cold upon animals which are subject to the so-called winter sleep. He found that marmots, hedgehogs, &c., when subjected to great cold artificially, although not thrown into the hibernating state, recovered from a low temperature which must have killed most warm-blooded animals.

Dr John Butler of New York has recently invented a little machine for the application of an electric current to the human body without a battery, and without such elaborate apparatus as requires the attendance of a skilled operator. The instrument consists of a metal roller covered with chamois leather, which at first sight appears

to be identical with one of those rollers used by paper-hangers for smoothing down their work. But on nearer inspection, it is found to possess a permanent magnet, and an electro-magnet, the latter being set revolving when the roller is moved over the surface of the body. The instrument therefore acts as a rubber, as well as an electric generator; and is said to give great relief in cases of nervous exhaustion, neuralgia, and many other of the ills which human flesh is heir to.

**Earnock Colliery**—near Hamilton, Lanarkshire—has now been fitted with Swan (electric) lamps, and the experiment seems to give every satisfaction. This, however, is hardly a conclusive test as to the suitability of electric illumination for collieries generally, for the one in question is not a pit liable to gas-explosions. The drawback of electricity for this purpose is the possible passage of a spark at any portion of the conducting wires and their fittings, which would inevitably be sufficient to fire an inflammable atmosphere. Some of the lamps used at Earnock Colliery are suspended from the roof, and are protected by strong glass globes and wire-guards. Others are fitted with cables, so that they can be moved about from place to place as required. That the light given is sufficiently intense, may be proved by the fact that photographs were lately taken in the depths of the colliery.

We have until now regarded such monoliths as Cleopatra's Needle as huge curiosities, whose like it would be difficult to produce by any means at our disposal. That other nations have thought the same, may be proved by the presence of a sister obelisk at Paris; and another which has lately crossed the Atlantic. But our American friends have detached a monolith from a quarry at Westerly, Rhode Island, before which these others must sink into insignificance. It measures one hundred and fifty feet long, by eight feet thick, and is estimated to weigh one thousand tons. The owners offer to dress it to the shape of an obelisk, and to erect it in New York for one hundred and fifty thousand dollars; and they are open to contracts for the production of obelisks of any pattern or size.

With tunnels through mountains, tunnels beneath our streets, and a projected scheme for a tunnel beneath the Channel which separates us from our French neighbours, it is all-important that we should have some efficient means of ventilation, which will enable us to breathe in these subterranean passages without being half suffocated. This desirable end seems to have been practically accomplished in a certain tunnel which forms an approach to the bridge which crosses the Mississippi at St Louis. The ventilator there used consists of a high chimney made of boiler-plate, in which works a pneumatic screw, capable of discharging about four hundred thousand cubic feet per minute. The screw is worked by a hundred and twenty horse-power steam-engine, which also gives motion to a dynamo-electric machine which will furnish the tunnel with light.

A most wonderful and interesting discovery has, as our readers doubtless know, been recently made in a gorge about four miles from the Nile, near Thebes. In a gallery two hundred feet long, hewn out of the solid rock, were found no less than thirty-nine mummies of royal and priestly personages who lived about three thousand years ago. Among these are the remains of King Thutmes III. and of King Ramses II. The first-named ordered the construction of the so-called 'Cleopatra's Needle,' which now stands on the Thames Embankment; and the latter placed upon the same monument a list of his titles and honours, about two hundred and seventy years later. In addition to these mummies, there have been found numerous papyri, some of enormous length. When these are deciphered, we may hope that they may add much to the records of Egyptological discovery. It is believed that these remains were removed from their place of sepulture, and hidden in this spot at the time of foreign invasion. They are mostly in a wonderful state of preservation; the garlands of flowers which loving hands had placed round the bodies three thousand years ago, having the appearance of those which might have been gathered only a few months ago; while the exquisite paintings which adorn the mummy cases appear to be as fresh as if they had just come from the brush.

Practical geology on an extensive scale is now engaging the attention of the United States Census Bureau. At first sight, there seems little connection between what we understand by a census, and geological science. And we may suppose that it is only by the accident of convenience that the Bureau is charged with this special duty. Samples of every kind of stone, each measuring four cubic inches, are being collected from every part of America. These are being examined as to their durability in different localities, and their adaptability for different purposes. The result has already been that many stones which have hitherto been used only for rough underwork, are now found susceptible of receiving a high polish, and serving as corner-stones if required. In one case it was discovered by chemical analysis that a particular rock, a kind of sandstone, contained about sixteen per cent. of phosphoric acid, rendering it far more valuable as a fertiliser than as a stone for building purposes. Had we had such a collection to refer to at the time that the present Houses of Parliament were built, we should not have had now to deplore the rapid decay of architectural adornments which have been carved in a material non-resistant to atmospheric influences.

An application of the induction balance invented by Professor Hughes, was employed to determine the exact position of the bullet in President Garfield's body. Our readers will perhaps remember that the induction balance depends for its action upon a movable coil of wire sliding upon a wooden bar between two fixed coils, through which an electric current is passing. The induced current in the movable coil varies with its proximity to the fixed coils, and these variations are made evident to the operator by an attached telephone. In such a delicate instrument, the near presence of any mass of metal must affect its action more or less; and by working in this direction, and treating a hidden bullet as

the disturbing mass, its exact position can be calculated with accuracy.

The application of electricity to the purposes of surgery is in these days no new thing; but a machine lately invented by Dr Bonwill of Philadelphia is of such a startling character, that it may well be styled a novelty. The surgical engine invented by him, and generously placed at the disposal of his fellow-creatures without the protection of a patent, is intended for amputations, and operations generally where the removal of bone is required. It consists of a set of drills and circular saws, which, by suitable gearing, are revolved at a very high velocity. By the use of this apparatus, operations are performed very rapidly, and in a far neater manner than by the unaided hand. Already giving satisfaction in the United States, the novel contrivance may be said to be on its trial here, for the inventor has presented one of the engines to St Bartholomew's Hospital. We shall probably soon hear what our surgeons think of it.

Wool-sorters' disease, a mild form of the terrible Siberian Plague, has lately formed the subject of a Report by Professor Brown. Inferior sorts of wool clipped from animals which have died of Anthrax, represent the source of infection, the disease itself being due to a microscopic plant in the fluids of the body. Professor Brown suggests that the importation of mixed wools should be prohibited, and that suspected or inferior samples should be isolated, with a view to their disinfection at the port of arrival. It is to be feared that no law would prevent unscrupulous traders from mixing wools, were it to their profit to do so; and in any case it would require the services of experienced wool-sorters to detect such mixture. The whole subject is fraught with difficulties, which it would seem impossible to obviate.

Another projected ship-canal must be added to the long list of such ventures which are now occupying the attention of engineers in all parts of the civilised world. The new water-way is to connect the North Sea with the Baltic, by a cutting through the land from Glückstadt to Kiel, so as to save a journey of about six hundred miles round the peninsula of Denmark. The canal will be fifty miles long—less than half the length of the Suez Canal; and, as in the case of the latter, the engineers intend to utilise small lakes which lie in the way. It is said that an English Company are engaged in negotiations for the execution of the work. However this may be, it is certain that English ships would benefit by the enterprise; for the route from Yarmouth to St Petersburg could then be traced by a straight line.

We recently described the 'detective camera' invented by Mr Bolas for taking photographs of unsuspecting subjects. A more simple and portable piece of mechanism has lately been devised by M. Bonnard, and judging by the specimens which we have seen, it is certainly a most effective apparatus. It is nothing more or less than an opera-glass with the fittings of a camera. The larger end of one barrel is fitted with a ground glass screen, on which the image is focused. The other barrel holds a tiny gelatine plate, which only requires a momentary exposure to receive a photographic impression. In action, the contrivance is held against the chest, and the touch of a trigger

uncovers the lens. The pictures taken are circular, and about the size of a crown-piece, but so perfect in detail, that in the case of one before us, the number and letter on a policeman's collar can, with the aid of a lens, be easily read. These Tom Thumb cameras are not yet in the market; but it is with some reason anticipated, that they will be widely used. When these and similar contrivances become common, we shall indeed be surrounded by a cloud of witnesses to our actions, whose evidence it will be impossible to impeach.

M. C. Bombonnel has issued a manifesto addressed 'to the sportsmen of all countries,' inviting subscriptions to a vast lion-hunting preserve which he intends to found in the wilds of Algeria. A pavilion fitted with every appliance and luxury for the hunters' comfort, is to form the centre of this unique establishment. Lions and panthers are to be attracted to the surrounding forest by the presence of old and broken-down animals, such as horses, mules, goats, &c., which are to serve as bait. When the wild beasts find such food provided for them, they will soon learn to congregate in the neighbourhood, when the noble sportsmen (!) will, from a secure arbuscade, drop bullets into them. We sincerely hope that subscribers will be so few in number that this establishment will never get beyond the paper stage. Sport ceases to have any healthy life or nobleness about it, when projected in this cold-blooded manner. The cruel suggestion with reference to the poor dumb brutes worn out in the service of man, will be quite enough to turn British sportsmen from the scheme.

Under the name of *Pändiger* or 'Tamer,' an Austrian chemist some time ago offered to sell to his government the secret of an anæsthetic which he had discovered. This compound had, he claimed, the property of rendering a human being utterly prostrate and defenceless in the space of a few seconds. The Austrian government not only refused to deal with the matter, but forbade the inventor, under pain of criminal proceedings, to divulge the secret to any one, or to continue his experiments in the same direction. Writers of sensational romance have thus lost a most useful auxiliary in carrying out their plots; they must therefore still continue to credit chloroform with the same attributes, in spite of the well-known fact that chloroform is far from instantaneous in its effects.

The Science and Art Department proposes to establish night-classes in rural parishes, in order to bring before those chiefly interested the scientific principles of farming. In West Somerset, a series of meetings is to be held, with a view of enlisting the help of the farmers in this meritorious scheme. We fear that there will be some difficulty in persuading farm-labourers that there is any science in operations to which they have been accustomed all their lives, and about which they consider they know more than anybody else. Still the scheme is worth a trial.

It is a remarkable fact that the death-rate of the French metropolis, compiled for the period comprehended between the 15th and the 21st of July 1881, gave an increase of fifty per cent. above the average of other years. We find it stated that the average number of deaths per day in Paris varies from one hundred and twelve to one hun-

dred and twenty-five; and that during the unusual heat of this exceptionally hot July, it actually rose to one hundred and ninety-two. A printed statement now before us gives us to understand that 'there has been no epidemic; but five hundred people died in Paris that week, who would have survived if the temperature had been normal.' Taking the foregoing in conjunction with the vast number of deaths from sunstroke known to have occurred in America, it will readily be seen how enormously the death-rate of any city becomes augmented during times of great climatic changes alone, and quite apart from the visitation of a specific disease.

It seems that for some time past there has been extensively employed throughout Germany a peculiar fluid substance, which has received the name of *Carbolineum*, and which being almost as fluid as water, is very readily applied not alone to wood-work, but to hempen goods generally. Its peculiar recommendation is due to the fact that it forms an excellent preservative agent for articles liable to contact with damp soil, or for such as are purposely destined for prolonged immersion in water; for example, wooden piles and the mesh-work of fishing-nets. The new preservative is an oil, apparently of the petroleum class, and has been found to contain, amongst other compounds, about ten per cent. of carbolic acid. One peculiar feature possessed by it is, that while it freely sinks into wood exposed to its action, and which it materially hardens, it does not close up the pores. Probably, *Carbolineum* will soon find its way into England.

Last month we noticed the fact that the Reserve Squadron, under the command of H.R.H. the Duke of Edinburgh, had dropped into the German Ocean a machine known as Vanderberg's Sea Messenger. This apparatus consists of a floating iron box, in three water-tight compartments; the middle one of which is for the reception of documents. The Sea Messenger dropped by the Squadron, as above mentioned, has since been found on the Norwegian coast. It had travelled between four and five hundred miles; and the documents it contained, one of which was signed by the Duke of Edinburgh, were quite uninjured. The invention is likely to supersede the time-honoured but more destructible bottle, as a medium of intelligence from ships at sea.

### OCCASIONAL NOTES.

#### ANOTHER GREAT ALPINE TUNNEL PROPOSED.

In our number for Nov. 13, 1880, an account was given of the principal tunnels in the world, the nature of their construction, with the cost, &c. Hitherto, the greatest wonder in the world of tunnels has been that of St Gothard, which is forty-eight thousand nine hundred and fifty-two feet in length, or eight thousand eight hundred and fifty-nine feet longer than the Mont Cenis Tunnel. And now it is under the consideration of the French government to construct another great Alpine tunnel, in order to bring Paris and the north of France into more direct communication with Italy. Two projects are on foot with this view. One is to strike a tunnel through the Simplon or the Great St Bernard, and the other is to cut the tunnel through Mont Blanc. The

tunnel under Mont Blanc would be forty-four thousand two hundred and ninety-two feet in length; while that under the Simplon would be sixty thousand seven hundred and nineteen feet, or eleven and a half miles. The latter would therefore be the longest tunnel yet constructed, though it would not be at so great an altitude as those above mentioned. It is not, however, expected that the Simplon tunnel will receive much encouragement, that through Mont Blanc being the more advantageous of the two proposed, shortening the distance between Paris and Brindisi by twenty-four miles, while affording great facilities for the interchange of commodities between France and Italy.

#### A HUMANE RABBIT TRAP.

A trap for the killing of rabbits, the invention of Mr Thomas Douglas, a gamekeeper, and called 'The Douglas Rabbit Trap,' has just been patented by Messrs Mortimer & Sons, 86 George Street, Edinburgh. Its specialties are, that it is more humane than the old traps, as the rabbit is killed outright, instead of having to suffer a lingering death with broken legs; and it will not capture anything but that for which it is set, dogs and other animals thus running no risk, as at present, of being maimed. It is fixed in rabbit holes, not in their runs; and the hands of the person setting it are not so likely to suffer damage or mutilation as they are from the toothed trap. The new trap has been shown in operation before gamekeepers, rabbit-trappers, and others well qualified to judge of its adaptability for the purpose intended, and these agree in recommending it as in every way greatly superior to the dangerous, pain-inflicting traps, hitherto used. Further particulars may be had from Messrs Mortimer, as above.

#### THE TWIN PLANTS.

Two ivy plants grow kindly on my wall—  
One from the leafy nest by Riald Mere;  
The other drank the dews of Greta Hall,  
Where Derwent spreads its mirror, calm and clear.  
And like the souls of their two Bards entwining,  
Entwine these sister-plants through shade and sun,  
Till, o'er my porch in glossy verdure shining,  
Sprung from two stems, they seem to spring from one.  
Southey and Wordsworth, who in thought may sever?  
In fame and love they bloom in Brotherhood for ever.

F. A. K.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. To insure return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. MANUSCRIPTS should bear the author's full Christian name, surname, and address, legibly written; and should be written on white (not blue) paper, and on one side of the leaf only.
- 4th. Poetical offerings should invariably be accompanied by a stamped and directed envelope.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

## SOCIAL LIFE AMONG THE ESKIMO.

PROFESSOR BOYD-DAWKINS has recently endeavoured to show that the Eskimo of Greenland and Arctic America are the veritable descendants of those primitive Europeans of the so-called Drift period who inhabited this and other countries when these were haunted by animals like the reindeer, cave-bear, hairy elephant, and other huge beasts either now extinct or gone hence before history began. This he does on the basis of a certain artistic faculty which finds exercise in the ornamentation of implements and weapons of everyday use. Whoever their remote ancestors may have been, the Eskimo are undoubtedly an interesting people. They cannot be called savage, and yet they are scarcely civilised. That they have made some progress on the way to civilisation is, however, evident from what we know about their habits, dwellings, and social organisation; though that they would go much farther on the same road, if entirely left to themselves, is open to doubt.

To what an extent the social conscience—as we may call it—of the Eskimo has been developed, is well shown in a number of stories collected by Mr W. H. Dall, of the United States Survey, while sojourning for several years in Alaska, on the north-west coast of America. 'The personal experience of the writer,' he tells us, 'during several years in North-western Alaska, gave him now and then a glimpse of the social thought of the Eskimo by whom he was surrounded; and from these reminiscences may be gleaned a few items which, without trespassing on the realm of Cooperian fiction, may give a slight insight into the working of the human mind under savage conditions.' Mr Dall, however, warns us that any view of native characteristics which leaves out the element of love-romance, resembles a vine from which the trellis has been removed.

The Eskimo of Norton Sound, Alaska, resemble most of the northern savage peoples in a total want of reticence on all subjects, except before strangers. Once friendship is assured—a matter

often a long time postponed after first acquaintance—conversation may be freely indulged in on any subject, unless it be the Shamanic mysteries or superstitions. In this way Mr Dall learned that even Eskimo life has its touches of romance.

A middle-aged woman, employed as a seamstress by Mr Dall's party, told him the story of her life. Born at Shaktolik, her wanderings had been confined between the Indian territory inland, the mouth of the Yukon on the south, and the Polar Ocean. When of marriageable age, her parents, being old, and desiring to settle their daughter in life, took her with them to the Kaviak country. They had heard of an old man there, who was very wealthy, according to their ideas, in deerskin dresses and supplies of food, and who, in addition to the two wives he had already, wished to acquire another, to be the youthful pet of his age. They arrived at his house in the depth of winter, were hospitably received, and opened negotiations. The wayward girl, either awed by the contemptuous glances of the elder wives, the absence of eyelashes and the presence of sundry wrinkles in her proposed partner, or by the fact that she would be wholly separated from her own people, fled in the night with a passing party of dog-sledges and natives, leaving her chagrined parents to settle as they might with the Kaviak sage. At Shaktolik she knew a young Eskimo, tall, handsome, a good hunter, and unmarried. Friendly glances passed between them; in short, she loved him, and hoped to be his wife. To adorn his deerskins, to applaud him at the winter dances, to proudly receive the sinew and belly of the deer (a wife's perquisites), when, on his return from hunting, she met him with the smoking dishes of seal-meat and fish she knew so well how to prepare—these privileges she lovingly and proudly anticipated. Alas! 'his face was very good, but his heart was very bad.' After trifling with her affections for months, he left her for a more engaging damsel, who, to the vindictive joy of the abandoned one, also suffered in her turn.

For a long time she refused all proposals of marriage; the very thought was hateful to her.

Then came a misfortune. When she was off with a salmon-fishing party, preparing the winter store of dried fish, her parents and entire family went southward to another village, on their way to set their nets elsewhere. During the salmon-fishery, it is against Eskimo ethics to boil water inside the house—it is bad for the fishery. The soup-pot was set near the beach; and while the others were collecting bits of driftwood, the youngest child, a few years old, moved thereto by sorcery on the part of the Indians of the interior, threw grass and poisonous plants into the boiling pot. All ate, and died. Poor Atleak—as the girl was named—was thus left an orphan, with no means of support, the inhabitants of the village where they died, claiming the property left by her family, and doubtless converting such of it as was not destroyed at the interment, to their own use long before the news reached Shaktolik. She immediately claimed the protection of an only and very distant relative by marriage, in whose house she worked, and by her neat sewing and constant industry kept herself supplied, through barter of work for skins, with clothing and other necessities which were not hers by the communal bond of the tribe. Shortly afterwards, winter set in, and she went northward with a party bound for Kotzebue Sound. It was a hard winter; the deer retreated to the most inaccessible valleys, and the supply of fish failed. Her party finding they could not rely on obtaining food at the various bivouacs, were obliged, through semi-starvation, to take a short cut to the Sound through the territory of the dreaded and hated Indians. Travelling as rapidly as possible, one day they came upon a little open spot by the bank of a stream where were two Indian houses. The few footprints in the snow were of women's feet, and curiosity tempted the boldest to peep into one of the houses. The inhabitants were dead or dying of starvation. The men were seeking the deer far away. The women had denied themselves to save little bits for a child some two years old, whose thin cheeks were rosy compared with the wasted ones of his dying relatives. Death was surely coming to them; and after that, what but death remained for the boy? The women begged the shrinking Eskimo to take him and keep him, that his life might be saved. But the race-hatred was too strong, and they had hardly food enough to keep their own party alive. One by one refused. At last, the girl who had lost her lover, who was an orphan (as she thought) through Indian sorcery, took pity on him, and said: 'I have no husband to work for; I will take the boy. He shall be my brother; and when I am old, I shall not be left alone.' So the Eskimo left the house of death, and took the boy.

From that time, to the time Mr Dall met her, her hands had been busy for him. He was then a lad of fifteen, bright, active, and promising, and knew only the Eskimo life and tongue. His deer-skin dresses were as handsome as any in the village, and his foster-sister's activity provided for

all his needs. She became indifferent to matrimony, since she had an object on which to expend her love; and it is to be hoped that when age enfeebles her steps, and bows her athletic form, her adopted child will not forget his obligations.

Let us give one other story from Mr Dall's collection, exhibiting a phase of life which one might expect almost anywhere than among the Eskimo.

A young woman, he tells us, really quite fine-looking, and of remarkably good physique and mental capacity, was observed to hold herself aloof from the young men of the tribe in an unusual manner. Inquiry, first of others, afterwards of herself, brought out the following reasons for the eccentricity. In effect she said she was as strong as any of the young men; not one of them had ever been able to conquer her in wrestling or other athletic exercises, though it had more than once been tried, sometimes by surprise and with odds against her. She could shoot and hunt deer as well as any of them, and make and set snares and nets. She had her own gun, bought from the proceeds of her trapping. She despised marriage, and did not desire to do the work of a wife; but preferred the work which custom among the Eskimo allots to the men. In short, she was a 'woman's-rights' female of the most advanced type. When winter came, having made a convert of a smaller and less athletic damsel, the two set to work with walrus-tusk picks, and dug the excavation in which they erected their own house, which was of the usual type of Eskimo houses—walled and roofed with driftwood covered with turf. It was, however, as an additional defence against unwished-for prowling males, divided into two rooms, with a very small and narrow door between them, next which lay some handy billets of wood, to crack the scone of a possible intruder. Here our two Amazons lived, traded, and carried on their affairs in defiance of communal bonds and public sentiment. The latter seemed to be composed half of disapprobation, and half of envious admiration; while all the young fellows in the village busied themselves in concocting plans against the enterprising pair. These were too fully on the alert to be surprised, and all efforts against their peace were fruitless. When the deer-hunting season came, the two set off to the mountains; and no sooner had they departed, than disappointed lovers, and 'outraged public sentiment' exemplified in a mob, reduced their winter-quarters to a shapeless ruin. So far as Mr Dall's information goes, the following year the ladies returned to the ordinary ways of the world, and gave up the unequal contest against a tyrannical public opinion.

A mother's love for her children is characteristic even of the lower animals, though with the latter it appears to cease with the maturity of the offspring. Among the Eskimo, however, in times of scarcity, if a child be born for whom food can hardly be provided, it is exposed to die of cold, with its mouth stuffed with a bunch of grass, to prevent it from crying. This is considered, not only as justifiable, but as the only course consistent with common-sense. The child must not cry, or its voice will be heard about the house afterwards. One of these children picked up and adopted by some one who can care

for it, owes lifelong service to the foster-parent. It has no property of its own except certain special articles; it must work for its foster-parent, and bring to him any wage received for labour. It cannot marry without his consent, and for its life long, is in one sense a slave. Yet the children reared by their mother are treated with devoted tenderness and care. They are never punished. They receive the last food when others are starving. Their dress glistens with beads and fringes, while the parents can barely cover themselves from the cold. The boy is eager to become proficient in manly exercises. He is not considered marriageable until he has killed a deer. All play together until ten or twelve years of age; then boys and maidens separate in their sports, except in the village dance-house, and even there, seldom take part until they are of mature age.

Mr Dall gives an interesting sketch of the daily round of an Eskimo housewife in early winter. Rising in the early hours, when the first faint glimmer through the parchment-cover of the smoke-hole indicates the peep of dawn, she removes the cover, and searches the hearth, where carefully covered embers should still be glowing; and if they are not extinguished, gathers them together, places some light dry sticks upon them, and going outside, arouses the sleepers by pitching down a quantity of fuel through the aperture in the roof. Before coming in, she arranges some bits of wood or boards, to aid the draught through the smoke-hole, and brings from some adjacent running spring a kettle of water for drinking and cooking purposes. Returning, the beds and mats are rolled up against the wall; and the inmates perform their very simple toilets, which consist chiefly in putting on their clothing, all of which, except a pair of deerskin socks, is usually removed at night. A few touches to the hair, a dry wash with a bit of cotton rubbed over the face, or at the most with a little fine snow in lieu of water; after which, bunches of dry grass are arranged in the boots to fit the foot, the boots are put on and tied, and they are ready for the day's work.

Meanwhile, the housewife has prepared the materials for a meal of boiled deer, or seal-flesh, or of boiled fish with oil. The morning meal, always hurried, is seldom delayed to roast meat or fish on sticks, as at the evening meal. The house-fellows make short work of their breakfast, and immediately disperse, to visit their traps or pursue the vocations of the day. The remnants of the meal fall to the share of the dogs; the wooden dishes are usually hastily cleaned, and the mistress of the house sits at her daily work. At this season, this usually consists in preparing deerskins for boots or clothing, or cutting and sewing the skins into garments. From time to time during the day, a morsel of deer-fat, a bit of dry salmon or some other fragment of food, is incidentally discussed, but without any regularity. Since most of the women are similarly engaged in the morning, there are usually few visitors till the middle of the day is passed, unless some girl, bringing her work with her, comes in to sew in company with others, if her own house be empty of female associates. Chit-chat, scandal, and small-talk, make up the bulk of the conversation, broken only by directions in regard to work

from the more experienced to the younger members of the family.

As the day draws into afternoon, some stranger from another village may present himself, when with few words he is directed to a sitting-place; one of the women removes his wet boots, and places them, and the straw pads they contain, in the smoke to dry; and something in the way of refreshment is at once offered to him. Silence reigns for a time; when slowly, bit by bit, and at long intervals, the stranger tells the story of his journey, the latest news in his own village, and any messages he may bring to the household.

As night comes on, the sewing is laid aside, the smouldering fire is built up to throw out a generous blaze, and one of the household goes to the roof to look for the returning hunters or trappers with their spoils. Fur animals are the property of the trapper; but he can only claim exclusive right to the skin, sinew, fat, tongue, head and belly pieces of the deer. The remainder is distributed to any who may need it, or reserved as the common property of the house-fellows, if there are no other applicants. The wife receives her husband in silence, removes his belt and guncase, puts his boots to dry, offers him a bit of meat and fish; and when he has taken his accustomed place, calls his attention to the stranger, while she prepares the evening meal, which is the event of the day. The oil-lamp is now trimmed and lighted; conversation becomes general; all eat together, served by the mistress of the house; and when the repast is over, tales have been told, and the fire burns low, the large embers are tossed out of the smoke-hole, the coals carefully covered, the parchment replaced, to keep in the warm air, beds are unrolled, and the inmates, laying themselves head to the fire, are soon sunk in slumber.

With a few trifling changes, might not this serve as a picture of the every-day life of many a humble family in our own country?

## THE FORTUNES OF BERTRAM OAKLEY.

BY JOHN B. HARWOOD.

### CHAPTER XLVI.—THE OLD FOLKS.

'THERE are things'—Inspector Birch of the Southampton police, who, like most of those who had dealings with Bertram Oakley, had come to hold a high opinion of him, was the speaker—'things that our people can do better and truer than others, and things they can't. They haven't the time for it, Mr Oakley. I've been a detective for a goodish many years, and I should say, if you want a plain, straightforward inquiry into a hidden crime, or as to a lost person, go to Scotland Yard. Our people may be slow, but they're sure. Being under discipline, which is good for us all, sir, at least they work honestly, and don't pick your pocket, which is more than can be said of all those Private Inquiry Offices that advertise so coaxing in the newspapers. But if you wish for something delicate and crooked, and out of the rules—especially abroad—go to one of the Private Inquiry chaps, and pay by results. Allow reasonable, for expenses; but pay by results.' Thus it was that the Inspector wound up what was certainly well intentioned, and probably sound, advice.

To a Private Inquiry Office, then, in Northumberland Street, Strand, Bertram repaired, and found little difficulty in coming to terms with the Inquirer-in-chief, who might have been a note of interrogation in human shape, so bent of body and so inquisitive was he. Such as he was, he certainly exemplified the truth of the saying that some men are born for their vocation in life. Mr Pryor, had lynching and tar-and-feathers, instead of substantial reward, been the recompense of his exertions, could scarcely have prevented himself from poking that sharp nose of his into the affairs of his fellow-creatures. In a country of different political complexion from our own, he would probably have been a government spy, keen as a ferret on the track of conspirators. In England, he devoted his talents to the service of private patrons. Mr Pryor, after very slight demur, agreed with Bertram's proposal, founded on the detective's hint of payment by results, provided, of course, that all preliminary expenses were guaranteed.

'And these, I will not disguise from you, Mr Oakley, will be heavy—decidedly heavy,' said the Private Inquirer, very frankly. 'Exclusive information, if I may say so, constitutes a sort of fancy goods, not to be bought except at a high figure. When people are ill advised enough to grumble at our charges, they forget that there is a debit as well as a credit side to our ledgers. Advice, I have heard, is to be got gratis. It may be so; but I am sure that intelligence is sold, and very dear too, Mr Oakley. I am only the man at one end of the wire; and I must work through others, supplement their blunders, and pay, through the nose very often, for tidings which may prove irrelevant after all. Inquiries take time, and take treating, and— Well, sir, if there is no objection as to terms, I shall be happy to serve you to the best of my poor power.'

Mr Pryor listened patiently while Bertram explained his object.

'Bless me! bless me!' muttered the head of the Inquiry Office, as the short and simple explanation came to an end. 'I thought of course that there was something wrong,' he added, after a pause; 'and, excuse me, Mr Oakley, it would have been an easier business if there had been a screw loose somewhere. Innocent people are, of all others, the most difficult to trace. You have tried before, I think, and without success? May I ask, through what channel?'

Bertram mentioned Murphy's Office, in New York. It had been recommended to him by a correspondent of Mr Mervyn's; but no good had been effected in consequence of the researches then made.

'Murphy's—that is, Murphy's of Tammany Street, Fourth Block, I suppose—is a very respectable establishment, but has not the connection of others I could mention, in Chicago and elsewhere,' remarked Mr Pryor, whose acquaintance with the members of his own unrecognised profession, in the Old World and the New, was probably extensive; 'and I am not surprised that the matter did not succeed in their hands. Such a length of time has elapsed, you see. It is but a cold scent, Mr Oakley, that we have to hunt; and to find out immigrants after all these years, in so vast a country as the States, well—I won't discourage a new client.'

'But you have discouraged me, Mr Pryor,' said Bertram sadly; 'and yet I am convinced that you are right in what you tell me as to the uncertainties that beset so difficult a calling as yours. This search is one on which I set my heart years ago, when I was a poor boy, helping the sailors to get their smacks afloat on the Somersetshire coast; when I was a poor lad seeking employment among the woollen factories of Blackston. When I got rich, I used to say to myself, I will seek out my father and my mother far away, and make their old days, I trust, happier than their pinched, precarious life can yet have been. They will receive me, I am sure, as one risen from the dead, the son they mourned and lost so long ago, the baby-boy who perished in the shipwreck, and from my hand they can accept the means of comfort, which— But you are laughing at me!'

For Mr Pryor had buried his sharp face in his bony hands, and was snorting and puffing like a walrus. 'Laughing at you! Upon my soul, Mr Oakley, I was nearer to crying than to laughing!' exclaimed the Private Inquirer. 'We, in our business, see such a lot of the seamy side and the shady side of human nature, that— Never mind! I'll tell you in confidence, that few of our clients, though the law may be on their side, come into court with clean hands. We do see meanness, we do, and dirty tricks, and guess at motives unavowed, that sicken us too often. It's as if a breath of fresh country air had come blowing into Northumberland Street with no taint of the Thames mud in it, and— You just leave me the Family Bible, with the entries, Mr Oakley; and I'll do my best for you, sir, in America and in England. I'll find the old folks for you if they're yet above ground.'

#### CHAPTER XLVII.—NO TIME TO LOSE.

'A telegraph for you, sir,' said Bertram's landlady, in Bentinck Street, Southampton, as he alighted from the cab that had conveyed him from the station. These semi-educated females *will* say 'telegraph' still, as when the electric wire was a comparatively novel institution, and before—after a sharp newspaper controversy, in which Balliol scholars, Double Firsts, and blunt business men to whom Greek was as Hebrew, penned letters to the *Times*—'telegram' was definitively adopted as the name for the startling announcements that put a girdle round the world.

Bertram took the despatch and read it. It was from the house-surgeon of St Bartholomew's Hospital. It ran thus: 'Patient, Accident Ward, wishes to see you. Important communication. Bad case. Cannot last many hours. Name, Nat Lee. Fortune, he says, depends on it. No time to lose.'

So Bertram, instead of entering his lodgings, got into his cab again, drove back to the station, and reached London by the next up-train; and thence to St Bartholomew's Hospital as fast as a handsome driver, well fed, and with a lean, well-bred horse to whirl his tall wheels along, could hurry him.—'Accident Ward? And you are the gentleman from Southampton?' said the house-surgeon. 'I'll walk round with you. He is alive still, No. 68.'

What a contrast it was between the feverish hurry and speed of Bertram's rapid journey back

to the Metropolis, and the hush and rest and calm vigilance, of which evidences met his eyes on every side as he walked through the great Hospital, with its many trim white beds, its neat nurses gliding about on their errands of mercy, and the orderly aspect of the whole place! It might have seemed, to a fastidious taste, a trifle too mechanical, too severely ruled and measured, too much as if its Good Samaritanism went by clockwork; but it was manifestly a powerful engine working for the relief of some fractional part of the huge sum of human suffering. Bertram thought of himself at St John's, under the ancient roof of the Knights Hospitallers; but there, the sick were few, and he had been an individual, so to speak, not a mere item or cipher, to go into the tabulated Report at the year's end.

'Sensible, and stronger than I thought,' whispered the good-natured house-surgeon—one of those doctors who yet preserve the faculty of seeing the patient, when others see only the disease—as he felt the sufferer's pulse, and looked into the dim, bloodshot eyes. 'I will leave you with him, Mr Oakley. If you want me—What is it, nurse?'

And the house-surgeon was gone; and Bertram remained, bending over the bed. Its occupant had seen him, and knew him, but did not immediately speak, stirring uneasily from side to side on his pillow.

'Brought very low, sir,' said Nat Lee, after a minute or two of silence.

'I am afraid so, and I am sorry to see you thus,' rejoined Bertram kindly, as he stooped to smooth the pillow which the sick man's restless movements had disarranged. 'You have been hurt?'

'Hurt—killed!' answered the man, in a hoarse, grating voice. 'No use mincing matters, Mr Oakley. They did it with their sling-shot. I fired twice, and put a leaden bean into big Abiram Pell's left shoulder. It was he who gave me this—pointing to a deep cut over the right eyebrow—'with his brass knuckleduster; and then, when the table was knocked over in the scullie, and the candles, and the bottles, cards, knives, dollars, and gold, were all rolling about, then it was, with the sling-shot—I am dying, young chap—internal injuries—the doctor said so,' added Nat Lee, gasping, after a pause. 'I've as many lives as a cat; but this that happened to me, river-side way, in a house where queer customers, Yankee and Greek and Spanish, are plenty—this, I guess, has taken the ninth of 'em! I did not send for you, Mister, to hearken to this rambling talk,' pursued the adventurer, after another pause. 'Only, now I'm going—going away for ever—the memory of the good turn you did me long ago, and how scurvily I requited you, comes back to me. I'm sorry, sir, I ever was your enemy; and I want, before I lose the number of my mess, to prove it. I don't pretend,' he added ruefully, 'that if I'd lived, and could have seen my way to do it, I wouldn't have stepped in again between you and Miss Rose—a rich wife, you see, would be such a settledown in life to a rolling stone like myself!'

There was a long silence. Bertram was the first to speak. 'If you really know, as you have hinted before to-day, of some property to which Miss Denham and her sister are entitled, of some rights which are withheld from them, it should be,' said

Bertram, 'a relief to your conscience, if you are strong enough to speak, to reveal it.'

'My conscience!' sneered the ex-welsher, tossing his long black hair uneasily to and fro. 'But you're right, Mr Oakley. I've got one—the worse for wear, so it is; but it pricks me. I felt right-down mean, I did, when I leagued with that slimy snake, Judas Crawley, to blacken your good name—you who picked a worthless blackguard like myself out of the ditch where I might have died, and serve me right; for I was nigh as bad as this, but not quite! Now, if you want to get a fortune for the girl, and to see justice done, don't you waste time, but get a magistrate here, late as it is, and get my deposition taken down, signed, and sworn to, ship-shape, for I shall slip my cable before morning!'

And so earnest was Nat Lee in his purpose, that Bertram, though still half incredulous, resolved to comply with his request, and left the Hospital at once, promising his dubious acquaintance soon to return.

## HINTS TO DYSPEPTICS.

Of all the ills that flesh is heir to, few are more insidious or distressing than dyspepsia, a disease unhappily so common that it seldom attracts sympathy. It is like toothache in this respect. Because it does not kill exactly, we scarcely give it pity. Perhaps this is owing to the fact that the dyspeptic in nine cases out of ten is the author of his own miseries. Be this as it may, there is no question about the suffering entailed. Once dyspepsia takes hold of a person, it is not to be easily got rid of. The food-fiend, one might almost call it; for many are the men and women, both dead and living, the springs of whose life have been poisoned by this malady.

We have just met with a most valuable little book on the subject, *The Causes and Treatment of Imperfect Digestion* (J. & A. Churchill, New Burlington Street), from which we hope to gather a few useful hints that may help the dyspeptic. It is written by the late Dr Leared, an eminent physician, who had made the subject his study, and in giving us the result of his experience, has left us a legacy of no slight value. He starts with one important simile. He says that 'the digestive powers may be compared to the physical strength. Every individual can, without inconvenience carry a certain weight, while any addition to it is accompanied by a proportionate sense of oppression. In the same way, what is called indigestion is often simply a result of excess. The amount of food which each man is capable of digesting with ease, has always a limit. The limit bears relation to his age, constitution, state of health, and habits.'

The particular causes of dyspepsia are many and various in different subjects. Food is necessary to supply the waste of life; and the more rapid the waste, the greater need for replenishing; thus young people require more food than old. But each person should study what suits his constitution individually; as one person may be able to take an amount of food which would be fatal to

another. One fault, however, the author points out with regard to the 'relative amount and distribution of meals' in our country, which we can verify, as we have seen the disastrous results which have followed upon taking a light breakfast of coffee or tea and bread-and-butter, and allowing the stomach to go all day on this light meal—with a still lighter luncheon only—until late dinner in the evening, when solid food has been taken for the first time in the twenty-four hours. Where a light breakfast is eaten, a solid meal is requisite in the middle of the day. When the organs are left too long unemployed, they secrete an excess of mucus, which greatly interferes with digestion. One meal has a direct influence on the next; and a poor breakfast leaves the stomach over-active for dinner. This is the secret of much excess in eating, and arises from the insufficient quantity and bad quality of the gastric juice. The point to bear in mind therefore, is, that not to eat a sufficiency at one meal makes you too hungry for the next; and that when you are too hungry, you are apt to overload the stomach, and give the gastric juices more to do than they have the power to perform.

To eat too often and to eat irregularly, is another source of indigestion. People who dine at uncertain hours, and eat one meal too quickly on the last, must expect the stomach to retaliate in the long-run. Another very fruitful source of dyspepsia is imperfect mastication. We remember one old gentleman who used always to warn young people on this point by saying: 'Remember you have no teeth in your stomach.' Nervous people nearly always eat fast, and as nearly always are the victims of nervous irritability, produced by dyspepsia. We believe that one reason why dinner-parties are not so dangerous—digestively speaking—as they ought to be, is, that people are compelled, through courtesy, to consume their food slowly and in small quantities each mouthful; thus the quantity consumed is counteracted by the long time used in consumption, which does less violence to the stomach than one plateful of meat flung down unmasticated.

Snuff-taking and smoking produce dyspepsia when the result is waste of saliva. On the other hand, some people find smoking assists digestion if taken in moderation. To sit much in a stooping posture interferes with the stomach's action. Dr Leared says he has traced 'well-marked dyspepsia to sitting immediately after dinner in a low arm-chair, so that the body was curved forward, and the stomach compressed; and that in some trades, the pressure of certain implements upon the pit of the stomach, as in the case of curriers, bootmakers, and weavers, produces severe dyspepsia.'

These are a few of the many sources of dyspepsia. Let us now look at some of the symptoms. First among these is flatulency, which is an exaggeration of the naturally gaseous condition of the stomach. Allied to this is fermentation. To show the discomfort produced by this form, it has been proved by experiment that during fermentation an apple will evolve a volume of gas six hundred times its own size!

To follow closely all the varied symptoms of dyspepsia, would here be out of place. It is worth while to notice a few that are curious, and often borne with unconscious of the cause, which may now be referred distinctly to indigestion. One of

these is what is known as the 'fidgets,' a restless state of body, which comes on frequently after dinner, from which there is no relief except by going entirely to rest; and even then it pursues the victim. Another queer symptom is the fancied unnatural size of the limbs or hand. Many can testify to this experience, fancying their hand or leg has grown to a colossal size. All indigestion this. Who would have thought it!

But the most painful form of dyspepsia is that which reacts on the mind, and produces what is so sadly frequent—mental depression. People of nervous temperaments are peculiarly susceptible to this form, which arises in them from the imperfect and distorted impression produced by impure blood upon the delicate organ of the brain. This impurity is owing to indigestion, which poisons the blood that feeds the brain, and gives rise to all manner of gloomy fancies, and the greater evil of hypochondriasis, which, as the author shows, is only dyspepsia in another form, the details of which might fill volumes. Among the many perverted fancies, some believe themselves slighted by their friends and the world. Extreme sensitiveness makes others voluntary exiles. Groundless suspicions, irritability, irresolution, are also common symptoms. So are morbid apprehensions and fixed ideas. One curious case in point is quoted of a gentleman whose life was rendered miserable by the constant recurrence in his mind of a particular number, which he believed had some connection with his fate in this world and the next. The fear of lightning was so strong in another gentleman, that it made him ill to mention the subject of electricity.

Surely to escape from such torments were worth a sacrifice, as the monster which sows these evils is to be crushed by those who have courage and self-denial equal to the task. The chief essential is diet; but in attacking this, we attack the one formidable difficulty. Who is equal to continued restraint? or being equal, knows to a nicety what, in his particular case, to eat, drink, and avoid; as, above all, the rule holds good in dyspepsia, that one man's meat may be another man's poison, both as regards quantity and quality. General rules are laid down, to be followed as their assimilation with the constitution indicates. The evil of not supplying the stomach at breakfast with substantial food has been already noticed, and the author is emphatic in pointing out that it is one which needs correction. Good black tea is recommended as a suitable beverage for breakfast, unless coffee is found preferable. But chocolate should not be taken. Cocoa, properly prepared, may be used by those it suits; and in the case where the nervous system is excitable, barley-water or thin gruel may be taken with advantage, where they do not give rise to acidity. Bread eaten by dyspeptics should be of the purest kind, and never new. Brown bread should be avoided by those of delicate mucous membrane. Muffins, hot buttered toast, and all greasy preparations, are fatal to dyspeptics. Butter should always be eaten cold and sparingly. The underdone yolk of an egg agrees with most digestions; the white is indigestible.

But to go through the category of what should and should not be eaten, would be tiresome. There are certain cardinal rules to go by, which we give as worth remembering; though unfortu-

nately the majority prefer their pains to privation. How often have we heard it said: 'I would rather live a few years less, than give up everything worth living for;' that is, eating! But for those who are in earnest in preferring a happy mind to the pleasures of the table, we would give, through our author, the following hints.

To strive in diet to combine always the greatest nutriment with the least bulk, so that the body may be nourished without giving the digestion too great a weight to carry, as 'we live by what we digest, not by what we eat.' To attend particularly to mastication. A faulty state of the teeth is one sure source of dyspepsia, and will produce the complaint where it did not exist in the first instance. Artificial teeth should be employed where the natural ones have failed, or the food minced where these cannot be used.

Regularity in the hours of meals cannot be too strongly insisted on. The stomach should not be disappointed when it expects to be replenished. If disappointed, even a diminished amount of food will be taken without appetite, which causes the secretions to injure the stomach, or else impair its muscular action. Any changes in the time of meals should be made gradually.

Of food itself, bear in mind that hot meat is more digestible than cold. The flesh of young animals is less easy of digestion than that of full-grown. The flesh of wild animals is more digestible than that of domestic animals. Land-birds are more digestible than water-fowl. And in game, long-killed birds are less digestible than those newly killed. With the exception of sweetbread, the visceral parts of the animal, such as liver, heart, and kidneys, are indigestible. White-fleshed fish is easier of digestion than red; and fish containing much oil, as the eel and mackerel, are difficult to digest. Shell-fish are out of court altogether.

Dyspeptics should never eat fried food. Broiled, or roast, or boiled, is all that is admissible for them. Hashes, stews, and made dishes produce what is called foul dyspepsia, and are to be eschewed by those who suffer from that form of the malady.

The skin, core, and kernels of fruit should be avoided. The author gives a case of dyspepsia that was greatly aggravated by eating pears. The fruit in its ripest state, he says, contains an abundance of gritty material, which, as it cannot be separated in the mouth, on being swallowed irritates the mucous membrane internally.

We are gradually closing up all the pleasant avenues to the enjoyment of the palate, when we say that other prohibited articles are pastry, sweetmeats of all kinds, and sugar. The courage of resistance has broken down before this last demand, and to rob a poor man of his sugar, is a crime little short of robbing him of his beer. But to fight a foe with his own weapons, one must be as relentless as one's enemy.

The subject of dyspepsia is an inexhaustible one. Look at it as we may, we feel that it is only to be skimmied, or rather hinted at, in these short limits. Still a signpost can indicate the right road to the traveller. If in the present instance we have served in that worthy capacity, by pointing out to dyspeptics the right road to recovery, we shall be glad for their sakes, as well as for that of the late author to whom

we have made reference, whose extremely useful work deserves to become a handbook to every one possessing a digestion.

## CAPTAIN DESMOND'S DAUGHTER.

IN FOUR CHAPTERS.—CHAPTER I.

LARCH COTTAGE, MARDON-LE-WILLOWS,

April 6, 18—.

MY DEAR MARGARET—The envelope in which this letter will be inclosed will have prepared you in some measure for the melancholy tidings which it is my painful duty to convey. Your poor dear father died suddenly on Monday evening, or, to speak more accurately, about a quarter past one o'clock on Tuesday morning. In him I have lost the best of husbands, and you the most loving of parents. I have been so heart-broken and bewildered, that I have been quite unable to write before now, and I really forgot even the existence of the telegraph. You will come here as quickly as you can, I feel sure. Your presence at such a time will be my only comfort.

That the blow will be a terrible one to you, I cannot doubt—as it has been to me; but we must try not to forget that we are always in the hands of One who ordains all these afflictions for our ultimate good.

Your poor papa had only arrived here by the five o'clock train on Monday afternoon. He was seized at the dinner-table, without a moment's warning, and never spoke afterwards. It was indeed terribly, mysteriously sudden. Even now, I can scarcely realise the dreadful fact.

Further details, dear Margaret, I reserve till I see you. I only add that the funeral will take place on Saturday. There is a lovely little rural churchyard here—such a sweet quiet spot—just the place my dear Marriaduke would have chosen, had the opportunity been granted him of doing so. The sea breaks within a quarter of a mile of it—a continuous soothing murmur. I hope to find a resting-place there myself some day.

Do not fret, dear child, more than is absolutely necessary. Not all our tears will suffice to bring our lost ones back again.—Now and always, most affectionately yours,  
HONORIA DESMOND.

P.S.—This is such a dreadfully out-of-the-way place, that you had better bring your mourning with you. They will fit you out in a couple of hours at Jay's. I have been compelled to order mine from there.  
H. D.

MISS DESMOND,

No. — Kensington Palace Gardens,  
LONDON.

As she finished its perusal, the letter dropped from Margaret Desmond's nerveless fingers. She sat down on a sofa and shut her eyes, and tried to realise the full force of what she had just read. Her father dead! and without one last word—one last look even—for her who loved him so dearly! It was like some hideous dream; only there on the carpet lay the missive which forbade her to think of it otherwise than as a most solemn truth. She had not wept hitherto—the suddenness of the shock had stunned her too much; but now her tears came with a great blinding rush. She buried her face in the soft cushions of the sofa, and wept till she could weep no more.

The children—over whose interests Margaret presided as governess—were abed, and Lady Thorn-dale would not be home till ten o'clock. By that hour, Margaret's grief had in some measure calmed itself down. She rose, went to her own room, and having bathed her face and smoothed her hair, she went in search of her Ladyship.

Lady Thorndale, in the languid way which use had made a second nature with her, expressed her sorrow at hearing of Miss Desmond's loss, and at once granted her the requisite leave of absence from her duties. Howard and Irene must have a few days' holiday from their lessons; that was all. No doubt, the children would be delighted.

By ten o'clock next day, Margaret found herself in the train, and on her way to Mardon-le-Willows. After the first half-dozen miles, she had the compartment to herself, and could weep in silence and unseen. All the incidents of her past life in which her father had had a part—and how few they were in which he had not had a part!—rose up again in her memory. First of all, there was her life as a child while her mother was still alive; and what a scrambling, Bohemian sort of existence it was! As far as she could remember, they never seemed to stay at one place for any length of time; it was a life of perpetual change. Sometimes there were days together when there was hardly enough food in the cupboard to satisfy their hunger, and she had a child's quick instinctive knowledge that many a time her mother pretended to be too ill to eat, in order that she and her father might have enough to sit down to. Other times there had been—glorious times they had seemed to her, only somehow they never lasted very long—when the wolf that had howled at their door was apparently banished into infinite space—times when her father would drink wine and smoke big cigars, and wear an embroidered waistcoat, with a heavy gold chain festooned across it; when she herself would have beautiful clothes to wear; when there would be long drives into the country, and dinners at hotels with windows overlooking gardens full of flowers, and rivers shining in the sunlight. Only, somehow, she could not remember that her mother was often there to share her happiness. Then there came recollections of occasions when her father would bring gentlemen home with him, who drank and played cards, and sometimes quarrelled amongst themselves; whilst she and her mother sat together in another room, almost afraid to stir, and longing for their unwelcome visitors to go. Then, as by the stroke of an enchanter's wand, they would be poor again, and all her father's finery would vanish, and instead of long-necked bottles of sparkling wine, there would be tankards of beer fetched from the nearest tavern.

By-and-by came the first great trouble of her life—the death of her mother. It was a trouble so sharp, and left behind it a wound so lasting, that even after all these years, her heart ached as of old whenever she thought of it. After that, her Aunt Charlotte came and took the motherless girl away with her; and for many years she only saw her father on rare occasions. What a kind, good-hearted woman, in her rigid, methodical way, was her aunt; only, it was not kind of her, whenever she mentioned poor papa—which was not often—to speak of him as a charlatan and an adventurer.

So, in the quiet seclusion of a little country-town, the years sped peacefully by, and Margaret grew up to womanhood. Then came the news of her father's second marriage; and following closely on that, the death of her dear old aunt. On hearing of the latter event, her father at once wrote her to join him in London; which she did in the course of a week or two. 'For the future, your home will be with us,' he said, as he presented her to her step-mother. But after a fortnight's trial of it, Margaret decided that her home must be anywhere rather than there—that she and her step-mother could not exist long under the same roof, and that the one thing for her to do was to go out into the world and earn her own living. Her father, scandalised at first by the notion of such a thing, had at length given way, and a situation had been found for her as governess to Lady Thorndale's two children.

Of late, Margaret had scarcely seen more of her father than when a girl at her aunt's. His epistles to her, brief and few in number, were generally dated from Brighton or Harrogate, or some other fashionable watering-place. As to how he lived, or whence his income was derived, she knew no more than the man in the moon. Nowadays, Captain Desmond was always fashionably dressed, and never seemed to be without gold in his purse. For anything Margaret knew to the contrary, the widow whom he had taken for his second wife might have brought him a handsome dowry.

But all these were matters of by-gone days, and now, alas! her father himself belonged only to the past. In spite of all his shortcomings—or, it may be, partly by reason of them—she had cherished him with devoted love. She remembered how, when a child, she had thought him the handsomest, the cleverest, and the best of men. Handsome he always was; but later years had taught her to doubt whether he was either very good or very clever. But whatever might have been his failings or shortcomings, her love for him had known no change; and that he had loved her in return, after such fashion as it was in him to love any one, she did not doubt. Just at present, it seemed hard to believe that she should never hear his voice, never see his pleasant smile again; that the only lips in the world she cared to kiss were dumb and cold for ever!

She had read Mrs Desmond's letter several times since her first receipt of it; and each time she read it, the less she liked the style in which it was written. Her father had died on Monday night; and yet it was not till late on Wednesday evening that the news of his death had reached her. From what Margaret had seen of Mrs Desmond, that lady did not seem at all like a person who would be overwhelmed with grief for the loss of any one. Had she had some purpose in withholding the information from Margaret as long as she could decently do so? Margaret made up her mind that her step-mother should not long be troubled with her presence. As soon as the funeral should be over, she would bid her farewell, probably for ever, and go back to the duties by which she earned her bread. But with what a sense of loneliness would she go back!

Till the receipt of her step-mother's letter, Margaret had never heard of such a place as Mardon-le-Willows. On consulting a gazetteer,

she found that it was a little out-of-the-way hamlet on the Lincolnshire coast, with a population of some three or four hundred souls, chiefly engaged in the fishing-trade. What could have possessed her father, a man addicted by nature and habit to change, excitement, and the perpetual flutter of life in one or other of its busy centres, to take up his quarters, even for a time, in such an out-of-the-world spot, was more than she could imagine. Even in the worst of times, when Captain Desmond had found it necessary to economise, he had economised in the town, never in the country. He was wont to say that he had not a rural mind, and that he was never really happy unless he was surrounded by bricks and mortar. A strange place, Mardon-le-Willows, for such a man to locate himself in.

The afternoon was beginning to fade when Margaret found herself at her journey's end. On inquiring for Larch Cottage, she found that it was nearly half a mile from the station. She took a road that for part of the way kept within sight of the beach, but that afterwards trended sharply inland, and so by-and-by brought her to the house she was in search of. While she was still some distance away, she recognised it: the white blinds were drawn down at every window; and again her eyes overbrimmed with tears.

The cottage—or rather house, for it was a substantial red-brick building, and could not have contained fewer than ten or a dozen good-sized rooms—stood back a little distance from the main road in its own grounds, and was partly overshadowed by some noble trees. With a heart that was beating fast with varied emotions, Margaret opened the gate, walked up the gravelled pathway, and knocked a low faltering knock at the front door. The summons was responded to by a middle-aged, smug-faced woman, to whom Margaret took an intuitive dislike at the first glance.

'You are Miss Desmond?' said the woman. 'My mistress has been expecting you. Will you please walk in?'

When she had ushered Margaret into a room, she said: 'Mrs Desmond has a bad headache, and has gone to lie down for a little while; but I don't suppose she will be very long.'

'Pray, don't disturb her on my account,' said Margaret hastily. But at this moment Mrs Desmond entered the room.

'My dear Margaret, I am so very glad you are come!' she said, and then Margaret was embraced. 'This is a truly sorrowful occasion on which to meet; but we must resign ourselves to the will of Providence. I cannot tell you how I have been longing to see you. I was so very, very lonely!'

For a few moments, Margaret could not speak. When she had wiped away her tears, and could look at Mrs Desmond, she saw that that lady's naturally fair complexion had been made to look fairer still by a liberal use of powder. But the dark circles under her eyes seemed to speak of sleepless nights and many tears, and Margaret's conscience pricked her when she remembered her uncharitable thoughts towards Mrs Desmond during her journey. Margaret was not to know, or even to suspect, that the dark circles under her step-mother's eyes were produced by artificial means, in which that lady was an adept. Mrs

Desmond was a tall, fair woman, with large, cold, blue eyes, and a profusion of blonde silky hair. She was very vain both of her eyes and her hair. She was about five-and-thirty years old; but she flattered herself that when dressed for the day no one could possibly take her to be more than seven-and-twenty, and it is very likely that many people did not believe her to be more than that age. In any case, she was the junior of her late husband by some fifteen or sixteen years.

'I have ordered a cup of tea to be got ready for you at once; so refreshing, you know, after a long journey,' said Mrs Desmond. 'Dinner will be served at half-past six—though, indeed, it is quite a farce for me to sit down to table. I have scarcely been able to touch a mouthful since the shock of Monday night. I will ring for Elspeth, to show you to your room. She shall take your tea up-stair.'

'I should like to see papa, if I may do so,' said Margaret with a faltering voice.

'My dear child!' cried Mrs Desmond, 'I am so grieved that you are too late! The coffin was closed last evening!'

Poor Margaret sank into a chair, feeling more heart-broken than ever.

## JOINT-STOCK ENTERPRISE.

If variety could make a Blue-book charming, the lately issued Return of Joint-stock Companies formed and registered between the first of June 1878 and the last day of May 1880, should be delightful reading; but we must confess to having derived but little pleasure from its perusal.

Glancing down the seemingly interminable catalogue of Companies, one is impressed with the fact that there is no such Jack-of-all-trades as your 'promoter.' Nothing comes amiss to him, from banking to bill-posting, from insuring life to burying the dead. He is equally ready to build mansions for millionaires or homes for artisans; to popularise art or wash dirty linen; to brew good ale or concoct medicinal waters; to work a colliery, publish a newspaper, open a theatre, found a college, establish a race-meeting, light a city, or cut hair. Limited liability is his philosopher's stone; and let pessimists preach as dolefully as they may, he will neither let art nor commerce, laws nor learning, die, while he can float a Joint-stock Company.

With all their audacity, the gentlemen who live by contriving outlets for other people's money are rather imitative than original, strong in the faith that the public cannot have too much of a good thing. Not long since, they were all for building gigantic hotels; by-and-by they discovered that a tramway was the only road to fortune; just now, the Indian gold-field is their Tiddler's ground, in which they have already persuaded the speculating public to sink three millions of money, a large proportion of which has gone into the pockets of the vendors of the mines.

Her Majesty's Civil Servants having demonstrated the profitableness of combining to supply their domestic wants, a 'Stores' mania set in with great severity. Naval and military officers, clergymen, doctors, lawyers, every section of the public, were invited to join with their peers and become their own purveyors, through the medium of the Army and Navy Co-operative Association; the

Clergy Co-operative Association; the Legal, Medical, and General Stores; the Warehousemen and Clerks' Direct Supply Association; the Nonconformists' C.O. Association; the Working-men's C.O. Stores Company; and divers other takingly named Companies of like character. War with private traders thus declared, an assault all along the line was soon organised. Associations for supplying dairy produce, fish, meat, bread, and beer, without the intervention of the ordinary dealers, sprang into existence. Tailors and hosiery were threatened with extinction by a Gentlemen's Dress and General Outfitting Association; and lest the ladies should complain of being ignored, their needs were provided for by a Mutual Dress Supply Association, a Paris Bonnet and Millinery Supply Association, and a Mutual Jewellery Association. Altogether, sixty-eight co-operative, or assumedly co-operative Companies were registered in two years; seventeen of which were wound up in that period; while of the aggregate capital of three million seven hundred and ninety-two thousand pounds, not a tenth part was actually raised.

The 'Stores' craze exhausting itself, somebody discovered that the want of the age was the institution of beerless public-houses, wherein British working-men could hob and nob over the non-incubriating cup, and cheer their hearts with aerated draughts. Straightway, philanthropic promoters came to the front, anxious to fill the land with Coffee Palaces, Cocoa Taverns, Workmen's Institutes, and Temperance Cafés; and to meet the views of more advanced dietetic reformers, the Food Reform Restaurant Company offered to provide establishments for supplying 'refreshments in the preparation of which no fish, fowl, flesh, or intoxicating liquors shall be used.' By the end of May 1880, a hundred and forty-seven Coffee-tavern Companies had been formed in England, seventeen in Scotland, and three in Ireland, having together a nominal capital of £1,900,615, and a real one of £130,031—figures contrasting somewhat oddly with the return of the Burton brewers, Messrs Bass, Ratcliff, and Grettton, a Company counting but eleven shareholders, yet registering a nominal capital of over three millions, and a subscribed capital of £2,720,000.

The objects of some of the Companies are so remarkably out of the common way, as to claim special notice. The Livingstonia Central Africa Company proposes to navigate the rivers and develop the trade of that interesting country; the Philological Society, to investigate the study and knowledge of the structure, the affinities, and the history of languages; and the Guild of St George, 'to determine, and institute in practice, the wholesome laws of labourers' (especially agricultural) life and economy; and to instruct, first the agricultural, and as opportunity may serve, other labourers and craftsmen, in such science, art, and literature as are conducive to good husbandry and craftsmanship.' Another Company devotes its energies to opening up new employments for women, and will, it is to be hoped, prove more successful than the Ladies' Philanthropic Society, which sought the same end by 'making cigarettes by machinery, and otherwise generally carrying on the business of tobaccoists,' and got wound up in the effort; a fate that, we fear, has ere this overtaken 'Miss Lila Clay's Company of Lady Minstrels,' for 'organising a select company of

lady artistes, professing great musical, vocal, and histrionic talent.' A hundred and ninety-four believers set up the British Israel Identity Corporation, 'for the sale of works bearing on the identity of the British nation with lost Israel, and the buying up of existing copyrights of identity works;' and fifteen bold men identified themselves with a Company 'for becoming surety or security for any borrower of money or compounding debtor, and guaranteeing the repayment of borrowed money;' but they have cautiously abstained from paying anything on their shares, having apparently no such confidence in the result as that displayed by the seven speculators who put down two thousand five hundred and twenty pounds to 'establish a business similar to that carried on by Hermann Loog, at 128 London Wall, and elsewhere.'

Half a million of English money has gone to give Moscow gas, three hundred and fifty thousand pounds to supply Monte Video with water, and a hundred and twenty-five thousand to improve Egyptian lands. The mines of Italy, Bavaria, Spain, Portugal, Hungary, California, Utah, Nevada, Nicaragua, and French Guiana, have extracted vast sums from English pockets; but we rejoice to learn that British investors refused to find one hundred thousand pounds for a floating dock for the Barcelonense; to spend fifty thousand pounds in constructing drains for the extraction of waste water and sewage matter from the city of Valparaiso; or pay five millions for the pleasure of presenting the United States of Colombia with a railway.

In the space of two years, no fewer than two thousand and ninety-three Joint-stock Companies were registered; twelve being mutual Companies, and sixty-two limited by guarantee, tabulated as without nominal capital; while the remaining two thousand and nineteen Companies had, or should have had, together a capital of over two hundred and seven millions. Of these, fifteen were unlimited Companies, with a nominal capital of £4,595,664; and the rest limited Companies, with a nominal capital of £1,166,931,555; the number of this class being swelled by the transformation into limited associations of two insurance Companies, and ten banks—a curious commentary upon the dictum of a great banker, that joint-stock banks were deficient in everything requisite for the conduct of banking business, save extended responsibility. Of the newly formed limited Companies, seventeen hundred and eighty-nine were registered in London, thirty-seven in the provinces, a hundred and thirty-nine in Scotland, and sixty-seven in Ireland; making in all two thousand and thirty-two; of which a hundred and twenty-three were, within two years of registration, either wound up, or undergoing that conclusory process; and six hundred and forty-five were only supposed, not known, to be still in operation.

The statement that the defunct Companies represented a nominal capital of more than eleven millions, is calculated to conjure up a picture of widespread ruin; but the actual amount lost in these ill-fated enterprises was comparatively small. Eighteen of the moribund Companies, with an aggregate capital of a million and a quarter, never possessed a farthing of capital. Doubtless, the major portion of the forty-eight that give no

returns were in the same predicament, of having no shareholders save the original seven who signed the memorandum of association; and so we get rid of L.5,419,500, of which sum the London and Universal Bank is set down for two millions, the Traders' Banking and Supply Company for one million, and the Eagle Insurance Company for half a million. With the above eliminations, the capital jeopardised shrinks to L.4,345,700, of which only L.613,378 appears as 'paid up,' and some of that is fictitious. Of L.39,952 debited to the Liberia Coffee Company, thirty thousand pounds was represented by vendors' shares 'taken as paid up;' and in another case, the entire capital of thirty thousand pounds consisted of sellers' shares, upon which nothing had been paid. Taking all things into consideration, the total loss in connection with the wound-up Companies may be put down at less than half a million; a loss divided among three thousand five hundred and eighty-four investors.

The discrepancy between nominal and subscribed capital is often something ludicrous. A Company promising to provide Lytham with a pavilion, covered promenade, and garden, could only raise thirty-five pounds out of fifteen thousand. Tynemouth had to forego its aquarium because but sixty sovereigns, instead of five hundred times that number, were forthcoming. Wanting fifty thousand, the Expenditure Reimbursement Assurance Stores received fourteen; and the Paris Hansom Company obtained but two hundred and nineteen pounds towards its required hundred thousand. These examples, however, are quite thrown in the shade by a Company registered in 1869 with a nominal capital of two hundred millions, and a paid-up capital of two hundred pounds!

There are some notable instances of heavy individual loss. One Company losing exactly half its proposed capital, consisted of but twenty-eight shareholders, who had found amongst them one hundred thousand pounds. One Colliery Company cost nine investors three thousand pounds each; and another swallowed up forty thousand pounds, belonging to seven speculators; while eight men threw away forty-eight thousand pounds in turning an old private firm into a new Joint-stock Company. *Per contra*, the seven hundred and one pounds lost over the Bristol and Clifton Co-operative Company was contributed by two hundred and twenty people; and when a Cocoa-room Company came to grief, there were twenty-two temperance advocates to exchange condolences on the disappearance of two hundred and sixty-nine pounds.

At the date of the Return, a hundred and ten Companies were in operation, which must have been carrying on business at their creditors' expense, since none of them had received a penny of the L.22,297,505 due, or supposed to be due, from their shareholders; among them figuring one Company with a nominal capital of five millions, another with one of four millions, a third with two millions, and three professing to have funds to the extent of a million.

Since October 1862 to the end of May 1880, fifteen thousand eight hundred and ninety-seven Companies have been registered in the United Kingdom. In England, 14,141 Companies, with a nominal capital of L.1,737,619,466. In Scotland,

847 Companies, with L.77,324,544. In Ireland, 507 Companies, with L.30,114,288. In the Stanaries, 402 Companies with L.10,719,359. The total nominal capital reckoning the enormous sum of L.1,855,777,667—showing that speculators have not been idle during the last twenty years. The moral of all this is, beware of promoters and joint-stock companies generally.

## CLARE.

## A PRACTICAL LESSON.

'GEORGIE! I fear you must put off going to Brighton for the present, unless you will go with the children without me. After all, why should you not do that, and take the governess with you?'

Mrs Sanderson raised her large handsome eyes to her husband's face, and stopped in the act of filling the breakfast cups. 'What can you mean, Walter?' she said slowly. 'I do not quite understand. Why must I go to Brighton without you?'

'Because, my dear, I must run down to Scotland instead. My mother wants me.'

'Oh, your mother!' and a slight cloud came over her usually calm face. She had not met with many disappointments in her married life as yet, and she had been looking forward for some time to this visit to Brighton.

'Yes; she writes that she would like me to go down as soon as I can.'

'Is she ill, or what? Does she give no reason?'

'Well, no; I can't say she does; but I imagine somehow it is something about Clare.'

'Clare! I duresay it is. What is she doing now? Of course, you know, Walter, that I never interfere in your private family concerns; but in my opinion, you should strongly advise your mother just to give her her own way. A very short time of nursing in an infirmary would completely cure her of that whim. She is not at all the kind of girl for that sort of thing, brought up as she has been, every one yielding to her, and running wild all over your father's estate followed by half-a-dozen dogs, and getting her own way in everything. I believe it would do her a great deal of good to go as a nurse to an infirmary.'

'I have no doubt you are right; but I am certain my mother would never agree to it. Let me see. This is Thursday. I could go down on Saturday, and be back again by Wednesday morning early. That would give me three clear days there, and bring me home in time to take you to Brighton on the Thursday. That was the day you intended going, at anyrate.'

And so it was arranged. Mr Sanderson travelled down to Scotland the following Saturday, in obedience to his mother's summons. He had already decided that some new freak of his sister was at the bottom of the whole thing, and therefore, though annoying to his mother, not likely to be at all difficult to manage.

'It all comes from girls being brought up at home. If they could go to public schools like boys, and get all the nonsense taken out of them,

it would be a thousand times better. A girl like Clare, living constantly at home with her mother and governess, is sure to take the bit into her own keeping, and rule over everybody. I have half a mind to bring her back with me, and keep her until she falls in love with some one. That would be the best tonic for her restlessness.'

When his long railway journey was ended, he found himself standing on the platform of the dreary little side station, being hugged and embraced in the most affectionate and open manner by his sister, a tall handsome girl, who utterly disregarded the presence of a country woman, who, setting down the largest of her many parcels and bundles, stood looking on with undisguised curiosity at this manifestation of affection amongst the 'quality.'

'You darling old boy! I'm so awfully glad to see you,' said Clare. 'It is too nice of you to run down and see us in this way. Come along. Mamma will be in a fever until we get back again; for I am driving Frisky and Bolter to-day. We'll be at home in no time. Mamma wished to send the carriage; but I would not hear of it. Is your luggage all right? Oh, have you a sixpence for the boy who has been holding their heels? Frightened little animal he looks, doesn't he?—O yes; we are all well. How are you all, Georgie and the children? You should have brought them with you. Why didn't you? However, it is too delicious to have you all to ourselves.'

An unceasing flow of light-hearted, affectionate talk convinced Mr Sanderson that he had been doing his sister a great wrong in looking upon her as the cause of his hurried journey; and as he regarded her sitting beside him so bright and happy, driving her mad little ponies with reckless speed up hill and down dale, over stones and round corners, making the bleak moor ring with her pealing laughter whenever they encountered a severer 'bump' than usual, he almost felt as if he must apologise to her for having allowed such a thought to enter his mind.

'Walter! I do believe you are not listening to me. You are thinking of Georgie and the children. I don't believe you heard what I said. I was saying we must have long rides every day while you are here. Shan't we?'

'I fear, Clare, there cannot be many days of it. I must be in London again early on Wednesday morning.'

'On Wednesday! I never heard of such an idea! What in the world brought you down, if you cannot stay longer than that?'

What in the world brought him down?—that was just the question he was asking himself. There was nothing wrong with Clare—that was perfectly evident; not a hidden corner or thought, even in her chameleon nature—all was open as the day. If it was only about expired leases and back rents, &c., it would have been as well if his mother had written frankly, and allowed him to judge if such a journey and loss of time were necessary. But he was careful to keep these thoughts to himself, judicial training having successfully overcome the natural frankness of his character. He was saved the necessity of making any reply to her last speech by the sudden pulling-up of the ponies at the hall door.

'Take care!' laughed Clare as she saw him almost overbalanced by the extreme sharpness of the jerk. 'Ah! there's mother.—Have I not brought him home in good time, mother? Just twenty-five minutes from the station, and the ponies going like lambs.—No, Walter; I am not coming in at present; I always drive them round to the stables myself;' and off she drove, leaving her brother folded in the arms of his mother.

'I am so glad to see you, dear Walter. I was so thankful to get your letter this morning. It will be all right, now you are come.' And she led the way across the hall into the small room generally used by her and Clare when they were alone.

'Has Clare said anything to you? Dear boy! I am so anxious, that I can think of nothing else. Did Clare tell you anything?'

'Clare?' replied he. 'Then it is Clare, after all! Wait until I get this glass of sherry swallowed, and then tell me what it all is. Is it some new whim?'

'O Walter, worse than any of her other whims. She says she is going to marry—to marry a horrid man, a vulgar, low kind of person!'

'Whew! This is a new whim with a vengeance! I thought she had sworn matrimony.'

'Oh, don't make fun, Walter; it is too serious, and I am so anxious. The more I say to her about it, the firmer she seems to be. I do not know what we are to do.'

'Who is the man? Tell me all about it; and do not look so tragic, you dear old mater. At all events, it is a step in the right direction. A married life is more in her line than a Sisterhood would have been. But who is the man?'

'He is a cousin of Mrs Monkton, and a missionary in some mining village. Clare met him there last year, when those revival meetings were going on. I find out now that it was he who put that nonsense into her head about joining a Sisterhood, and devoting her life to nursing, &c. He was down here lately; and I noticed that a great many letters passed between them after he left; but I never for a moment thought of anything further. And then, a few nights ago, she told me she had quite given up all idea of infirmarium-work; for a much more useful and extended life had been offered to her. And then it turned out that when Mr Moffat was down here, he had got her to enter into a half-engagement with him.'

'Oh, only a half-engagement! We can easily settle a half-engagement. I'm thankful it is no worse.'

'But it is worse! That was only at first. She told me he had given her a fortnight to make up her mind. Of course, he is marrying her for her money.'

'We will let him know that she is almost entirely dependent on you, and that you won't give her a farthing, beyond the sum my father left her, if she marries without your consent. That will bring him to reason, I've little doubt.'

'Yes; but the difficulty will be with her; she will not give him up. The worse and more unsuitable such a marriage would be, the greater, I verily believe, will be its attraction for her. When will you speak to her about this?'

'I would rather that Clare should open the subject of her own accord to me. I will get her

to come with me when I smoke my cigar after dinner, and see what I can make of her.'

On finding himself, after dinner, alone with his sister in the smoking-room, Walter began to realise the difficulty of beginning a subject which she seemed to have no intention of introducing.

'Clare,' he suddenly began, 'do you know you have improved very much of late? You are rather a good-looking young person now. I am inclined to be proud of you.'

'Thank you, Walter. Was I so very plain before?' she retorted saucily, with a light laugh.

'No; I do not mean that. You were always handsome enough; but somehow, you strike me as being different this time. It may be your style of dressing, or the way you wear your hair; but there is a difference, I'm certain. You had better come back with me for a little. London is the place for a girl like you, and Georgie would enjoy taking you about. Poor girl! she is lonely enough at times, now that I am no longer a brief-less barrister. Will you come?'

'You are a good old fellow, Walter, and I love you dearly; but I will not go to London with you. A London life would not suit me. But I believe you when you tell me I have improved. I must have improved, at anyrate since you saw me in autumn; for I was unhappy and unsettled then.'

'About what, dear?' he asked in his gentlest tone.

'Well, you know I wished to become a nurse; and mamma would not hear of it, and I was tired of the life I lead here.'

'Yes; I don't wonder at that—it is altogether too dull.'

'O no, not that! But it is so utterly useless, and there is so much to be done, and so much that ladies can do better than any one else.'

'But you are not useless here. You have your Sunday class, and the choir to train, and your poor folks to look after. I think you are wonderfully useful for so young a girl.'

'Yes; that is just it; I am too young. I require guidance, Walter, and I cannot get it from mamma.'

'Clare!'

'I mean, that although mamma is as kind as possible to the poor, and gives them food and wine and clothes too, yet personally, she takes very little interest in them, and I cannot get her to come with me on my rounds. It would be so much better if she would, because, you see, some of the people do not pay so much attention to me when I give them advice, just because I am so young, and have no one to support me.'

'I can imagine that it is difficult for you, certainly. But is there no one else you could get to join with you?'

'Yes, Walter'—and a faint blush spread over her face—'and that is why I am so much improved, as you say I am. My mind is quite at ease; for, now I see my duty quite clearly. I thought mamma would tell you all about it to-morrow; but I should like to speak to you first, for she is very much against it, and I count upon your help to bring her round. I think it providential that you have come down here at this time, of your own accord too! I am engaged to a gentleman

who will be able to help me, and who will take me to a place where there is far more need of me than there is here; for do you know, Walter, though I have been working hard with all my heart all these months, I do not see one bit of improvement amongst the people.'

'Engaged to be married, Clare! Who is the gentleman? You sly puss! And so it is "first-love" which has improved you?'

'O no, Walter. I am not "in love," as you suppose; and neither is he; but we esteem and like each other; and we can do more for those poor people if we are married than if we were single. He says he needs a lady to help him.'

'But who is he, dear? You have not told me that.'

'He is a cousin of Mrs Monkton's, and is a very hard-working clergyman in a large and neglected mining village. His name is Moffat. He was here a good deal last year at the time of the revival meetings, and I got to know him then, but without any idea of marrying him; that has only been arranged a few days ago.'

'You take away my breath, Clare. That is the very last kind of marriage I should have expected a girl like you to make.'

'Ah, because you thought me vain and frivolous. But, dear Walter, promise me that you will talk to my mother, and make her see what a noble and useful life is waiting for me.'

'A noble and useful enough life, Clare. But before I can make any promises, I must think it over. I am not prepared to give my sister up to the first man who asks her. Tell me about Mr Moffat. What is he like? Is he young? And has he private means, that he thinks of a wife like you?'

'I do not know whether he is very rich or not; I never thought of asking him. But we should not want to be very rich; because, in the life we have planned, we should have no time for visiting or going much into society; and you know, Walter, I have never been so fond of going to balls and parties, as some girls are.'

'Well, Clare, I'll sleep on it, as the saying goes; and to-morrow I will have a talk with you again. Be sure that I will do my best for your happiness. And now, let us say good-night.'

Next morning, Clare came early into the breakfast-room; but her brother evinced no corresponding activity, and when he did make his appearance, the presence of her mother prevented all renewal of their last night's conversation. Nor was any private interview possible until far on in the afternoon.

'I thought mamma was never going to leave us alone to-day, Walter. And yet, how bad of me to talk in that way; for of course she is as glad to be with you as I am. Poor mother!'

'Yes, Clare—poor mother! You are preparing a bitter pill for her to swallow. How do you think she will like your burying yourself alive in a dirty, smoky, mining village?'

'Oh, then, dearest of old boys, you have come round to my way of thinking! I felt sure you would! You lead such a busy, useful life yourself, that I knew you would understand my feelings!'

'Stop a little, Clare. Not quite so fast. I certainly desire to see you happy, and I truly

believe a well-assorted marriage is the happiest state on earth; but'—

'Oh, no "buts," Walter!'

'You must hear me out. Before I can speak to my mother with any effect, I must see Mr Moffat. How can I urge the advantages of your marriage with a man I have never even seen? Everything in a case like this depends on the individual himself. In a worldly point of view, it is a wretched marriage for you; but there may be qualities and gifts in the man himself which out-balance all that, and make him more than your equal. Do you understand?'

Clare murmured 'Yes;' and her brother went on—

'Now, I think it would never do to write and ask him to come here for my inspection. I have been studying my *Bradshaw* this morning, and I discover that I can leave this by the eight o'clock train to-morrow, and be at his place, Reekton, about mid-day, spend an hour or two with him, and be back here by the evening train in time for dinner. What do you say to that? Then I can talk with some reason to my mother; or perhaps, if I am greatly impressed, I may even bring him back with me. Or stay! Suppose you come with me? Why not? I think that a splendid idea! You would introduce me, and smooth away any little awkwardness there might be in my going all alone, and having to introduce myself. It would be a delightful surprise to him. What do you say? Will you go?'

'How good you are, Walter! Of course I'll go. It will be simply delightful. But how about mamma?'

'Oh, leave my mother to me; I'll make it all right with her.'

Clare gave her brother's arm a grateful and affectionate squeeze. 'And Walter, we must send off a telegram from the station to-morrow, and then he will be waiting at the station there for us.'

'No; we will not telegraph, dear. In the first place, I don't want every one here to know where we are going; and then Mr Moffat would be making all sorts of elaborate preparations for us; and neither you nor I would like to give him any trouble by our visit—would we?'

'No; of course not. But he would like to give us lunch, you know. However, as you say, the people here would talk; and we can make up our minds just to take whatever his housekeeper can give us on short notice.'

And so the visit was thus arranged and carried out. The morning train took them off; and in due time, after some changes and delays, landed them at Reekton; a singularly well-named place, Walter thought, but refrained from saying; for he did not wish to prejudice his sister in any degree. The fine bright morning had been gradually becoming more and more overcast, and had now fairly settled into one of those still wet days which are to some temperaments peculiarly depressing. Except the station-master and a boy, not a soul was to be seen; any loungers that might otherwise have been there, being kept away by the double event of a steady rain, and of its being the general dinner-hour. A great many trucks filled with coal and coke, and others waiting to be filled; a long line, which in reality seemed to have 'no turning;' a wet, black, sooty road, stretching out

dull and cheerless between very high, straggling bare thorn-hedges; and a lowering mist hanging over a large irregular village, completed a scene which filled both the spectators with silent dismay.

'Ask if this is Reekton, Walter; perhaps we have made a mistake.'

Walter obeyed; and came back saying: 'That village there at the end of that lane is Reekton. It is unfortunate that it has turned out such a wet day. Shall I send the boy down to the inn, and see if we can get a cab or conveyance of some sort?'

'Yes, do, Walter, while I remain under the shed here.'

In a minute or two her brother came back with the intelligence that there was no cab or conveyance to be had. There had been a wedding in the village a few nights before, and the only chaise it possessed had been nearly broken to pieces in the course of the festivities. There was nothing for it but to walk; and the station-master directed them how to find Mr Moffat's house, which was right in the middle of the village, two doors beyond the *King's Arms*.

'What a wretched day,' exclaimed the girl, with a shiver as she spoke.
